

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE Motor-Car Journal.

Vol. IV.]

LONDON, SATURDAY, MARCH 8, 1902.

[No. 157.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WITH this issue the *Motor-Car Journal* enters upon its fourth year. The three volumes that have now been closed present a record of activity in the automobile industry that must have surprised even its most ardent pioneers. Automobilmism is a moving force in this country at the present time, and it is destined to play a very important part in many directions in the near future. As a promoter of social intercourse, a reviver of the prosperity of the highways, an industry that will bring wealth to many and comfort to thousands, and a factor in dealing with social problems, the motor-car is making its influence felt; and in recording its multifarious developments *The Motor-Car Journal* has a mission with which its conductors

(whose advocacy of automobilism in technical journals, years ago, prepared the way for this special publication) are proud to be associated. The success that has attended the career of this *Journal* has naturally been watched by others solicitous for the connection with automobilism that comes through advertisement channels, and during the past few months rumours have been current as to the appearance of other luminaries in the automobile system. That was inevitable. Should they come to anything, it will be merely a repetition of the experience of cycle manufacturers, who, when trade was expanding, were besieged by journalistic experiments, whose rise was sudden and whose fall was a kind of lingering sickness painful to the patient and expensive to the trade. In the youthful years of an industry there are limits to the degree of support which the business can give to sundry publications, and we are glad to recognise that the position of the *Journal* is well assured, and that the trade realises it is fully served both by journals and exhibitions.

The Exhibition.

ALREADY interest in the forthcoming motor-car exhibition is becoming general, and the fact that the Agricultural Hall will be visited by Royalty on one of the early days should decide exhibitors as to the necessity of having their displays ready in good time. The business managers are advising exhibitors to insert a penalty clause in giving out contracts for stand-fitting, so as to ensure punctuality in that important matter. An effort will be made to secure uniformity in the planning of the stands, so that an uninterrupted view of the whole exhibition can be obtained from either end of the Hall. In order to give every facility for exhibitors arranging their displays the Hall will be opened at 6 a.m. on the Wednesday preceding the exhibition, so that all work should be finished long before the hour of opening on the Saturday. Hitherto the motor-car exhibitions at the Agricultural Hall have been characterised by an advanced state of preparedness on the opening day. We are hopeful that the forthcoming exhibition will make a record so far as punctuality with regard to stands is concerned.

The Irish Automobile Club.

THE annual general meeting of the Irish Automobile Club has taken place at the Shelbourne Hotel, Dublin. A considerable number of members attended. The chair was taken by Mr. W. G. D. Goff, J.P., Chairman of the Club. The report of the committee for the past twelve months was read and confirmed, and showed the club to be in a flourishing condition and in a sound financial position, with a balance in hand of £80. The election of officers for the ensuing year resulted as follows:—President, the Right Hon. Horace Plunkett. Chairman, Mr. W. G. D. Goff. Hon. Secretary, Mr. R. J. McCreedy. Hon. Treasurer, Mr. E. U. Grimshaw. Committee: Lord Louth, Hon. Leopold Canning, E. O'Coner, D.L.; J. H. Glenn, M.D.; C. W. Hely, J.P.; Rev. Hon. B. J. Plunkett, J. F. Colohan, M.D.; Pryce Peacocke, M.D.; W. Sexton, Guillamore O'Grady, C. Yeldham, D.L.; F. Hall, B. Barrett, A. W. Perry, and Captain H. R. Langrishe. The following were elected members of the Club: The Marquis of Anglesey, Lady Garvagh, Mr. C. Jarrott, Mr. C. J. Engledew, Mr. H. B. Hill, Mr. J. M. Murphy, Dr. Sinclair, Mr. A. W. Perry, and Mr. B. Barrett.

Standards in Motor-Cars.

IN connection with the question of standards in motor-car construction, which has been referred to on several occasions in the *Journal*, it is interesting to note that the Engineering Standards Committee sat at the Institution of Civil Engineers, Westminster, on Tuesday, to hear evidence on the question of the standardisation of locomotives and the specifications for the materials used in their construction. In France *La Chambre Syndicale de l'Automobile*, of which M. Jeantaud is president, has for some time been considering the matter of standard sizes for motor-car frames, and at a recent meeting the following sizes were agreed upon:—For voiturettes, 1·8 metres by ·8 metre; for light cars, 1·9 metres by ·8 metre; for ordinary cars, 2 metres by ·85 metre; and for touring vehicles, 2·5 metres by ·95 metre. This standardisation of motor-car frames will, it is considered, greatly facilitate the work of carriage builders, who will now be able to put bodies through in series, knowing that they will fit any of the leading types of cars, instead of, as at present, having to make bodies of all sorts of odd sizes. *La Chambre Syndicale* has also under consideration the question of standard sizes of pneumatic tires and their components, and also of motor-car lamp brackets.

The Eccles Motor Fire Tender.

SOME time ago the Eccles Fire Brigade adopted a motor fire tender, which has apparently been doing good work until recently, when it was damaged in a collision with an iron pillar. One of the firemen had been learning to drive the machine, and the superintendent endeavoured to make the necessary repairs—with only moderate success. Certainly the motor was, in the opinion of the Fire Brigade Committee, quite unfit for work. The maker was then asked to give his advice, and he submitted three suggestions: (1) to repair the motor; (2) to supply a new motor similar to the present one for £40 in addition to the £80, the unpaid balance on the damaged motor; (3) to

supply a larger motor for the sum of £100 in addition to the £80. The Fire Brigade Committee recommend the purchase of a larger motor, and the matter is to be considered by the Town Council.

In the March Magazines.

MOTOR-CARS figure in both the *Strand* and *Pearson's Magazine* this month, the latter having a voiturette on the front cover and an article by Mr. Fletcher Robinson, who is concerned only with the humorous side of the subject—and very good humour he makes of it. In the *Strand Magazine* is an exciting "automobile story," by C. N. and A. M. Williamson, and as Mr. Williamson is an expert driver the tale lacks the mechanical absurdities that so often figure in such stories. At the same time, some of the incidents are sufficiently fantastical to amuse motorists as well as cause wonderment among the general public.

Ignition.

ON Saturday Captain J. A. Cole lectured on "Ignition" before the Lincolnshire Automobile Club. Having described tube ignition, Captain Cole dealt with electrical ignition, which allowed much latitude and a variance of the speeds of the engine. Having referred to dry batteries, amperemeters were next described, and although this part of the lecture was necessarily of a technical character, the apparatus and diagrams used caused the subject to be well understood by the audience. A Blake coil, which the lecturer coupled with motor-chains as articles which were produced better in England than abroad, was shown in section, as well as the soft iron core with thin wire round and covered by a condenser to take up the current and to make a quick break. A very interesting experiment was next shown: An instrument had been made by Mr. C. H. Gilbert for the lecturer, which was virtually a sparking plug in an hermetically-sealed glass tube, into which air was pumped, a gauge showing the pressure. The points were further apart than when in an engine, and at 19 lbs. pressure the spark failed. On being placed closer together the spark came at 59 lbs. pressure, then failed. Dynamos were described, also the Simms-Bosch Magneto-Electric ignition. In proposing a vote of thanks to the lecturer for the great trouble and expense he had been put to, Mr. C. W. Pennell, who presided, expressed the thanks of all present for the valuable information imparted. Dr. J. H. Pim, in seconding, said they were all very much indebted to Captain Cole, and would all benefit by the lecture.

Motor Vehicle Regulations.

ELSEWHERE we give the main features of a letter which has been sent to two thousand newspapers, and which may, therefore, be expected to be widely quoted during the next few days. It is signed by such representative men as the Duke of Sutherland, the Earl of Shrewsbury, the Earl of Onslow, Earl Grey, Lord Montagu of Beaulieu, Lord Brassey, K.C.B., Sir Redvers Buller, G.C.B., Sir Bernhard Samuelson, Bart., and others equally well known, who, apart from personal interests, have interested themselves in the prosperity and the future of automobilism. The letter declares that electric and steam trams are driven at speeds up to eighteen miles per hour, while the particulars given of the ease with which motor-vehicles can be stopped when travelling at high speeds are authoritative. It is also urged that we are, in this country, "repeating the same error of over-restrictive legislation which, in respect of electrical enterprise, stifled development in the United Kingdom so completely that the trade here has never been able to overtake the solid organisation which freer conditions enabled manufacturers to rapidly build up in Germany and the United States, where legislation does not blindly precede a new industry, but intelligently follows it." The wishes of motorists are discreetly set forth in the letter, and in conclusion the memorial suggests that members of Parliament

should be urged to induce the Government to take action with regard to what is desired. In this direction every motorist should set to work at once.

The Tare Weight.

It is satisfactory to observe that the signatories to this letter have recognised the importance of something being done to further the chances of success for the manufacture of heavy vehicles in this country. Owing to the restriction to a tare weight not exceeding three tons, the manufacture of motor-vehicles capable of carrying loads up to ten and twelve tons is prevented. This is regrettable in view of the value such vehicles would be in connection with the haulage of fruit, vegetables, and other perishable goods, to say nothing of the conveyance of heavy goods in the northern and midland districts of England.

Motor-Bicycles.

MRS. KENNARD's article on motor-bicycles for ladies, which appeared in last week's *Journal*, has created some impression among lady readers and lady journalists, and the makers of such machines owe her a debt of gratitude for the attention thus directed to a comparatively young development of automobilism. In our "Correspondence" this week Mr. J. Van Hooydonk has a further reference to the subject, and we would emphasise the suggestion with which he concludes his letter, viz., that motor-bicycles will "afford the purchaser a vast amount of pleasure if he (or she) will only make up his (or her) mind to understand what it is that makes the wheels go round." In the application of this sentence lies much of the secret of successful motor-bicycling.

Electrical Omnibus for London.

As intimated in these columns some weeks ago, the London 'bus companies are watching very intently the development in mechanical traction, and at the meeting of the London General Omnibus Company the chairman has just announced that that concern does not propose to be left behind in the matter. Last week we were able to announce that Messrs. Zadig and Company have an electrical omnibus in hand for the London Road Car Company. This will be the first electrical omnibus in the Metropolis, and all who have to travel in the City will await with interest its arrival on the streets in about three months' time. The new 'bus will not only be propelled by electricity, but will be electrically lighted throughout, and it is hoped that the cost will not be more than one-half or one-third of the cost of working horse-drawn 'buses. It will be fitted with two motors and one battery, the weight of the 'bus, exclusive of the accumulators, being about three tons. The battery will weigh about half a ton. In size the new 'bus will be similar to vehicles now upon the road, and it will accommodate twenty-six passengers.

Oil Fuel for Steam Fire Engines.

CROSSING over Blackfriars Bridge the other day to visit the headquarters of the Metropolitan Fire Brigade we noticed the motor dust-van of the Corporation of the City of London being carefully and easily negotiated through the traffic. It was heavily laden with the refuse of shops, offices, and houses, and with four men aboard naturally attracted considerable attention. At the fire brigade station we learned that the rumour which had attained newspaper publicity as to the "explosion" of a "petroleum" vehicle had lost nothing in the telling. The idea that the motor-car used for carrying the Chief Officer to the scenes of fire had met with an accident was quickly dispelled, and, as a matter of fact, that vehicle is a steam-car. There had, however, been a little incident, one of the new oil-fired steam fire engines having "fired back." In a little while coal and coke will be abandoned by the fire brigade for practical pur-

poses, and the steamers will be fitted for oil-firing. The principal advantage is that with oil fuel a working head of steam is obtained much more rapidly than with coal, and the experience of Commander Wells, of the London Fire Brigade, is that low-flash oil is much more suitable for fire engines than high-flash oil.

From Glasgow to London.

THE Scottish Automobile Club (Western Section) propose to organise a non-stop trial from Glasgow to London prior to the Automobile Club's Show, at the Agricultural Hall, in April. This trial will be open to all manufacturers registered under the rules of the Automobile Club of Great Britain and Ireland. The Standing Committee of the Automobile Club have approved of the proposal, subject to the rules being satisfactory to them. These are now in course of preparation, and manufacturers or those interested, or proposing to take part, should communicate with Mr. Robert J. Smith, C.A., 59, St. Vincent Street, Glasgow, the honorary secretary, who will supply them with the necessary information. We congratulate our Scottish friends upon the idea, and there is no doubt that the invasion of England by a number of motorists from the north of the Tweed will attract considerable attention to the industry.

Arousing Local Interest.

THE proposal is also capable of some development, for the tourists might be joined at appointed towns by the members of the various automobile clubs in England. There is no reason why the trial should not be participated in by the Manchester, Yorkshire, Nottingham, Lincolnshire, and other clubs, which could attach themselves to the main body at towns previously determined upon. Thus something attaching the interest created in the 1,000-miles trial would be secured and another demonstration given country people of the reliability of motor-vehicles. It might be worth while for the local officers of the clubs to communicate with Mr. R. J. Smith on the subject.

Horse Lovers and Automobilists.

A VISIT to the Shire Horse Show at the Agricultural Hall last week might, in one respect, be regarded as an anticipation of the Automobile Exhibition in the same place in a few weeks' time. For there were a considerable number of automobilists among the visitors, while on the Thursday Sir James Blyth and other members of the Automobile Club assembled for the annual meeting of the Shire Horse Show. Lord Llangattock was elected president of the Society, thus demonstrating anew the point that has often been emphasised in these columns—viz., that many of the keenest automobilists are friends of the horse.

Horse v. Motor Ambulances.

LONDON is to have its horse-drawn ambulances—provided by an enterprising County Council. The only criticism we have to offer is, that the Council should have first tried a motor-ambulance, so as to have had British evidence of what is a success in the United States. There electrical ambulances are a feature of "first aid" and hospital equipment. When the late President was shot an electrical ambulance was by his side within three or four minutes, and on the occasion of the recent terrible dynamite explosion in New York four such vehicles were on the scene within five minutes. We have been told by an eye-witness of the latter that the behaviour of these mechanically-propelled vehicles was perfect in every way, whereas the horses betrayed such nervousness and excitability in view of the falling brickwork and rubbish-strewn roadways that the injured were in danger of further accident when on the ambulance. The electrical ambulances glided in and out among the groups of people noiselessly and reliably, the absence of vibration and noise having a soothing effect upon the unfortunate victims of the catastrophe. Seeing

that the requirements of ambulances are absence of vibration and reliability in getting over the ground as speedily and as quietly as possible, the electrical ambulance seems to solve the problem in a perfect way. Messrs. Mark Mayhew and J. Williams Benn should urge this point upon their colleagues.

A New American Car.

A CAR of a pattern not before seen in this country put in an appearance at the Automobile Club on Thursday of last week, where it attracted much interest from the many novel points of design contained in it. Though driven by a petrol motor, it could hardly be distinguished from a steam or electric car when running. This vehicle, made by the Olds Motor Company, of Detroit, is at first sight of the usual American design, but on closer inspection proves to have no underframe, the body and mechanism being supported on two lengthy springs which reach from front to rear axle, the latter taking the drive by a central chain from the engine located under the seat. The motor has a single horizontal cylinder, with both valves mechanically actuated, and is apparently of about 4in. bore, with enclosed crank and remarkably massive flywheel outside. Its axle, carrying the speed gear, protrudes at the right side of the car, where it carries a handle in about the position of that on a De Dion voiturette, thus facilitating starting from the seat. Steering is by hinged tiller, a point certainly admitting of improvement.

A GROUP OF WELL-KNOWN MOTORISTS—MESSRS. EDGE, PEARCE, OWERS, CRITCHLEY, CAPT. LLOYD, AND CROMPTON, JUNR.

Driving and Transmission Mechanism.

THIS consists of an epicyclic gear with two brakes and a clutch, giving two speeds and reverse, the whole revolving together on the high speed, which should give a very efficient drive. A lever pivoted near the back of the seat, at the driver's right hand, actuates these in succession when pushed forward, by means of cams, and adjoining it are two small levers for switch and advance sparking. Compression is apparently very high, and is released by a heel-press. A novel point about the engine is that, though devoid of a governor, it is normally throttled, the throttle being opened against a spring by a pedal adjoining that of the brake, much after the manner of driving a Gardner-Serpollet, though the positions of the throttle and brake are reversed. Flanking the cylinder are a tank and carburettor, apparently of a surface pattern, on one side, and a silencer on the other, while a small water-tank lies above, and a centrifugal pump is driven direct from the left end of crank-shaft. Radiators, of rather small size and plain tube, lie underneath the front of car.

The most striking point about the vehicle is the almost absolute silence of its running, which seems hardly sufficiently accounted for by the large, but not obtrusive, silencer, which is furnished with asbestos lagging; and while unable to reconcile ourselves to much that is characteristic of American design, we must admit that the vehicle seems a successful effort after simplicity and "fool-proof" construction.

The Automobile Club.

UNDER the chairmanship of Mr. Roger W. Wallace, K.C., the annual meeting of the Automobile Club was held at the Club-house on Thursday of last week. There was a large attendance of members, and after the adoption of the balance-sheet for the past year and the submission of budgets for the ensuing year the election of the Club Committee took place. The annual report of the Committee recording much activity and a progressive membership having been accepted, the meeting passed to the subject of the proposed new Club-house at 119, Piccadilly, W. The Chairman announced that he had received 794 proxies in favour of the removal, and the necessary financial support was forthcoming, for members had agreed to subscribe for £16,220 worth of debentures in respect of the proposed £15,000 debentures to be issued. Mr. G. Cornwallis-West thought that provision should have been made for the accommodation of efficient repairers on the Club premises, but it was explained that there was a desire to keep clear of all trading competition. After some discussion as to the provision of seats from which to view the Coronation procession, the proposal of the Committee was adopted, and a resolution carried empowering them to make the necessary arrangements for removing from Whitehall to Piccadilly. An extraordinary general meeting was subsequently held, at which various alterations in the rules—some consequent on the foregoing decision—were made.

A WEEK-END AT BEXHILL.

WEEK-END trips are one of the new features of the present day, and the excuse to examine a private road at Bexhill-on-Sea for the purpose of deciding whether it was suitable as a course whereon the Automobile Club could hold a kilometre speed trial was taken advantage of by a number of motorists on Saturday last. The day was one of the worst of the year, and the roads were in a shocking state of grease; indeed, at the start of the run from town it was scarcely possible to steer the car. In going along the Brixton road—which is in a notoriously bad condition—every time the wheels touched a tram-line the car "shied," and evinced a disposition to waltz. We journeyed on a new 12 h.p. M.M.C. car through Tonbridge. Others went *via* Crowborough; but both contingents found the roads in a greasy state, and fast travelling was impossible and dangerous. After a short stop for a light lunch at Tonbridge, we proceeded on our way without incident until between Lamberhurst and Frimwell. We had got half-way down a hill when a perambulator with a child in it was seen stationary in the middle of the roadway. A number of children on either side were picking violets by the side of the road. On hearing the horn the children ran to rescue the child, pulling the perambulator both ways, so that it seemed certain that it would turn over. Our brakes were sharply applied, with the result that we commenced to fly round. The near-side wheels left the ground, and it appeared as if we were going over. The car went completely round twice in its own space, and the third time ran partly round on to the grass; a most unpleasant experience, and one that might have had disastrous results.

Continuing, we shortly afterwards met a village funeral, the coffin being carried in a cart, three villagers walking in their white smocks on either side, the clergyman in front, and the mourners following in the rear. Round the church gate labouring men in their suits of black had congregated, and the sight was altogether a pathetic one in its simplicity. After a short

stoppage at Battle we proceeded on our way, but had not travelled far before a troublesome horse was encountered, and in avoiding this we ran on to some soft ground, where the engine stopped and the wheels began to sink, until ultimately the car sunk nearly to the axle. The engine could not move the car of either with or without our assistance. There was no help for it, the jack was no good, so we proceeded to borrow three palisades from the adjoining fence in order to dig the car out. An hour's hard work with our clumsy implements enabled us to continue on our way, and Bexhill, bathed in sunshine, was reached at 3.30, our car being the first to arrive.

At five o'clock a M.M.C. voiturette, which we had seen at Tonbridge, appeared. Later came Mr. Tinne on a belt-driven Daimler; Captain Locock, on a 10 h.p. Wolseley; and Messrs. Astell and Phillips, on the four-cylindred New Orleans. At 7.20 Messrs. Drake and Gorham arrived on a De Dion, having been on the road since eleven o'clock, ignition troubles having delayed them; Mr. Edge and party arrived shortly after on a 16 h.p. Napier; Mr. H. Du Cros, jun., and Mr. G. Du Cros, both on Panhards; Mrs. Manville on her Gladiator, having driven the car herself all the way from London; and at 9.45 p.m. Mr. Mayhew arrived on the 50 h.p. Napier, having taken nearly seven hours to do the journey. The greasy state of the roads was mainly responsible for the slow travelling. Mr. Kenyon had started and abandoned the journey at Seven-oaks; Mr. Manville had also started on his 18 h.p. Daimler, but finished the journey by train. All had the same tale of greasy roads, and Mr. Astell had a similar experience to our own, through getting on to soft ground. Sunday was brilliantly fine, and after an examination of the track the party broke up, some going to Eastbourne, others London, others, like ourselves, to Worthing, where we were hospitably entertained at Warne's Hotel, which, apparently, is the great meeting-place for motorists on the south coast. Mr. Warne, in addition to a first-class hotel, has a fine garage, workshop, etc., and keeps a repairer on the premises. At one time there were seven cars in front of the hotel, including a Lanchester and a Teras.

On Monday we returned to town *via* Brighton and Reigate, having had a delightful trip, the car having run beautifully and tire troubles being absent.

A BALLOON race for English aeronauts is being informally talked of by members of the Aero Club.

AFTER the House Dinner of the Automobile Club on Wednesday evening next, Professor Hele-Shaw will read a paper on "Roller Bearings."

MR. E. SHRAPNELL SMITH is taking steps to arrange an Easter tour with a rendezvous at some point in the Midlands, and with this object is communicating with the hon. secretaries of the several centres of the Automobile Club, also with the parent body. A joint conference will probably be held in Manchester one day next week to consider the matter.

THE first annual dinner of the works employees of the Locomobile Company was held on Saturday last, at the Horse Shoe Hotel, Tottenham Court Road, W. The foreman, Mr. L. D. Ledbetter, was in the chair, and was supported in the vice-chair by Mr. C. Kimber. Mr. E. W. Stevens, the works manager, and Mr. W. M. Letts were present as guests. During the evening a testimonial was presented to Mr. E. W. Stevens on his retirement from the London works to New York, on account of his health. This consisted of a handsomely bound edition of Shakespeare's Works, and was made on behalf of the employees by Mr. A. Haswell. Mr. Stevens returned thanks in characteristic fashion. Mr. Letts proposed the health of the employees, and was full of confidence when he was speaking of the company's forthcoming improvements at Sussex Place, his remarks being received with much enthusiasm. Other toasts were given, and received their due share of attention; some capital songs were sung, and this, the first social function, was a huge success. The chairman was the recipient, at the hands of Mr. B. Paddon, of a handsome watch, suitably inscribed, as a "Token of esteem from the works employees to their foreman, Mr. L. D. Ledbetter."

The 1902 Benz Cars.

FIG. 1.—THE BENZ 20-H.P. DOUBLE PHAETON.

MESSRS. BENZ AND COMPANY, of Mannheim, who were among the first, if not absolutely the first firm, to take up the construction of motor-cars on a commercial scale, have recently so improved their vehicles that there is little or no resemblance between the latest types and the little cars which played so great a part in the early days of the automobile movement in this country. Hitherto the engine in Benz cars has always been located in the rear part of the frame. Consequently the placing of the motor under a bonnet in the fore part, as is done in the 1902 models, must be considered a radical departure. Of light cars, two are being made with seating capacity for two and four persons respectively, each being fitted with a single-cylinder engine of from 5 to 6 h.p. In touring cars, four standard types are being turned out, fitted with two-cylinder horizontal engines of respectively 10 h.p., 12 h.p., 15 h.p., and 20 h.p. The accompanying illustration (Fig. 1) shows one of the latest 20-h.p. touring phaetons with American buggy top, while Fig. 2 (on page 11) depicts the 10-h.p. tonneau. The general arrangement of the heavier class of cars is identical, the only difference being the use of larger engines, with proportionately stronger transmission mechanism and longer frames, so that one description will suffice.

To begin with the frame, this is constructed of steel and wood, supported on artillery-type road wheels by strong springs. The engine comprises two cylinders set opposite to one another, so that the connecting rods work on to a central enclosed crank-shaft. The engine, which runs at a normal speed of 600 revolutions per minute, is provided with electrical ignition, the tremblers being fitted on the induction coils, of which there are two, one for each cylinder. The water circulation for the cooling of the motor is maintained by a radiating coil and pump, the latter being

driven by a friction-wheel bearing on the fly-wheel. A float-feed type of carburettor is used, the supply of gas, and consequently the speed of the motor, being controlled by a throttle-lever near the driver's hand.

Passing now to the transmission mechanism, Messrs. Benz still retain a single straight belt to connect the motor with the change-gear shaft, the latter carrying fast and loose pulleys as well as a train of sliding spur-wheels, any one of which can be made to mesh with corresponding pinions on the differential-shaft. From the latter, the usual duplicate pair of chains and chain-wheels convey the power to the rear road wheels. Four speeds forward and a reverse motion are provided, controlled by two levers, arranged at the side of the inclined steering column. The driver has three pedals at his command—one shifts the belt on and off the fast pulleys, thus disconnecting the engine as on clutch-operated cars; another actuates a double-acting band-brake on the counter-shaft, while the third works in conjunction with a hand lever at the side of the car, and applies band-brakes on the hubs of each of the rear road-wheels, and at the same time shifts the driving-belt on to the loose pulley. Thus the driver can apply the wheel brakes and disconnect the engine either by the hand or foot, whichever he finds most convenient. Special attention has been paid to the question of lubrication, a series of oilers being fitted on the dashboard. The vehicles can attain a maximum speed of 28 miles per hour in the case of the 10 h.p., and from 42 to 44 miles as regards the 20 h.p., and, the road wheels being shod with large pneumatic tires, are very easy riding. The 10-h.p. car weighs about 15 cwt., the weight of the 20-h.p. phaeton, illustrated in Fig. 1, coming out at 21 cwts. Altogether the new Benz cars are a marked improvement in design, and are likely to be seen on the roads in large numbers.

during the coming season. Messrs. Hewetson's, Limited, are, of course, the sole British agents, and have already got several of the 1902 models on view in their extensive showrooms in Tottenham Court Road, London, W.

THE BRUNEAU MOTOR BICYCLE.

WE are this week able to give an illustration of the motor-bicycle which has lately been put on the market by Messrs. Bruneau and Co., of Rue Victor Hugo, Tours, France, which has come into prominence by reason of the fact that it secured the first place in the category of light motor-bicycles in the recent Criterium race in France. The frame of the machine follows the ordinary lines of the safety bicycle, but is of specially strong construction to withstand the strains set up by the motor. The latter is of the air-cooled type, and has a cylinder 63 mm. stroke. The normal speed of the engine is

1,800 revolutions per minute, and at this rate it is stated to develop $1\frac{1}{2}$ h.p. It will be noticed that the radiating fins only extend around the upper portion of the cylinder. The crank chamber is made of aluminium, and its exterior surface is so turned that there are no projecting corners to trouble the rider. From the motor the power is transmitted to the rear wheel by means of a strong chain, the usual pedals, chain drive, and free wheel clutch being provided to start the machine, and also to assist it up steep grades. A novel arrangement is found in connection with the pedals, in conjunction with which a special ratchet arrangement is fitted to enable the two cranks to be brought into the same plane, and thus serve as foot-rests when travelling along level country roads. The machine is fitted with a front rim brake operated by a lever on the handle-bar, and this is so arranged that when the brake is applied the electrical circuit is broken. The road wheels are 26 inches in diameter, shod with $1\frac{1}{2}$ in. pneumatic tires, the weight of the machine complete being about 77 lbs. At the recent exhibition in Paris Messrs. Bruneau exhibited a machine of the type illustrated, which bore a card bearing the legend "Sold to the Sultan of Morocco."

WE understand that the price of the 12 h.p. Belsize car has been increased, and that so many orders have been received by Messrs. Marshall and Company that they have been compelled to put on a night set of workmen to cope with the demand.

So active is the demand for motor-vehicles at Liverpool that the British and Foreign Motor-Car Company, Limited, of 27, Islington, Liverpool, inform us that they are now requiring three weeks' notice instead of the immediate delivery of cars.

FLOTSAM AND JETSAM.

BY FLANEUR.

THE bread which the Automobile Club cast upon the waters by its County Council campaign of last year is, indeed, returning in full measure. Among other successes, we have seen how the very Council with which the absurd "ten miles-an-hour" system had its origin has had the grace to cry "peccavi," and the County Councils' Association itself has demanded the abolition of any speed limitations at all. That, of course, being the expressed desire of a body representing all the County Councils, might legitimately be regarded as a final and comprehensive statement of the average councillor's position. But the subject still crops up occasionally at the deliberations of individual Councils, and in this connection the recommendations at the last meeting of the Buckinghamshire Council may be noted with interest.

BUCKINGHAMSHIRE has never been capable of being accused of overweening sympathy with the automobilist. Was it not at Beaconsfield that the gentle tactics of placing a scaffold pole across the road were adopted by the police? Was it not the Chief Constable of that county who attempted to introduce a new species of inquisition, by instructing the constables in his district to call on every local automobilist and obtain full particulars of the power and speed of his car? The County Council itself, too, if I recollect aright, showed itself to be among the ranks of the actively hostile towards automobilism. But what is the position now?

THE special committee appointed to consider and report upon the question of regulations for motor-cars have recommended. "(1) That the statutory limit of speed should be abolished; (2) that some efficient means should be prescribed whereby any motor-car or its owner could be easily identified; and (3) that the existing regulation requiring the person driving or in charge of a motor-car to stop should be amended so as to provide that where the request or signal to stop is made by a policeman he *must be in uniform.*" The italics are mine. Now it will be noticed that the first and third clauses are just what the automobilist desires, and it is particularly satisfactory that the folly of expecting him to stop for a policeman in plain clothes should have been recognised, even by outsiders.

As regards the matter of identification, it is, of course, well known to all the readers of this *Journal* that the Automobile Club will not oppose any practicable scheme. The difficulty is to find one meriting that description. In the opinion of the Buckinghamshire Committee, a general scheme of registration should be adopted throughout the country, with a separate letter for each county, and numbering to be carried out under that letter. The numbers, they consider, should be inscribed in the German fashion on both sides of a metal *plaque* fixed in front of the vehicle, and a duplicate should be carried in the rear; but they add "or that some other approved method might be adopted distinguishable by day or night."

THE members of the committee, I fear, were somewhat at sea when they drafted the second proviso, and, indeed, the Council, by a majority, referred the recommendations back because they were not sufficiently explicit as to the identification clause. A projecting *plaque* would only be visible to anyone at the side of a car, and would be no use as a means of identifying one that failed to stop when called upon. From the police point of view, it is obviously better to have numbers across the back and front of the car, not parallel to its direction; in the latter event, too, they would probably get knocked off at some time or other. But numbering of any kind is hedged around with practical difficulties, and the President of the Local Government Board himself has confessed his inability to devise a workable scheme, and is much more inclined to favour an increase in the powers

of the police. Nevertheless, the terms of the committee's recommendations are, on the whole, decidedly indicative of more enlightened views than formerly prevailed in that locality.

THE plea which a daily paper has set up in favour of the motor-quadricycle is not altogether easy to endorse. It is true that this type of vehicle has been materially improved, but its ultimate popularity is by no means assured. The original patterns, of course, were the most unmechanical abortions the automobile movement has yet produced: a 2½-h.p. engine was expected to carry two people up all hills, despite the fact of the machine having only a single speed. Between two and three years ago I bought one of these machines, but six months of it was all I could stand. I put more concentrated effort into driving that "quad" than I had ever done before, have since done, or hope to do in future; and in my time I have not been altogether idle, for I have probably ridden as far in a day on a bicycle as any non-athletic tourist—two hundred miles, to wit, in twenty-one hours, on two occasions.

engine. But though these newer factors would remove many of the disabilities under which I laboured on the 2½-h.p. pattern, the machine is still, I think, not to be compared, except in speed, with a voiturette at a trifling extra cost. The side by side position of the passengers in the car is more sociable than the tandem seating of the "quad," and is infinitely more comfortable, to boot. Owing to its lightness, the front passenger of a "quad" is jolted considerably on rough ground, while, as I found to my cost, the driver occasionally "ricks" his side severely when one wheel goes over a hummock and the other does not. I never could understand why this should be so trying, especially if driving alone without any weight in front, until I watched a "quad" owner who passed my gate a few days ago and bumped his rear driving wheel over a brick. The trunk of his body remained vertical, but the machine was tilted up on one side, and compressed the saddle springs also on one side. Now, on a car seat he would either have been jolted upwards, or his body would have departed from the perpendicular just at much as the axle was tipped up.

THE JAMES AND BROWNE 8-H.P. CAR (see page 11).

YET this was child's play to plugging uphill on a soddened surface, with an air-cooled motor, the efficiency of which decreased in inverse ratio to the work it was called upon to do. Times without number one found oneself on a hill that must be surmounted by motor-power and leg-power combined, if possible, or else one was obliged to dismount and shove the unwieldy beast by hand. Consequently one exerted every effort to keep the motor going, and the last few yards generally meant a superhuman struggle, resulting more than once in a severe strain; and not having the heart or muscles of a Sandow, I sought consolation in a car instead, which has proved a more satisfactory article. My quadricycle experiences provided more interesting incidents and situations than I have ever known on a car, and though, of course, the former was comparatively easy to move when disabled, I would not willingly go through those experiences again.

As for the improved type of quadricycle, it is a very different article, I admit, as regards reliability and power: what with its larger motor, water-cooling, a two-speed gear, and even a free

riding on a saddle is quite different, and the compression of the side when one wheel rises is sometimes extremely painful. When one considers the price of a "quad" with water-cooling and other modern improvements, and compares it with, say, a 5 h.p. Peugeot voiturette at £155, the argument is all in favour of the car. The arguments in favour of the quadricycle have never been elaborated, it is true, so far as its latest patterns are concerned, and at one time I myself thought that there might be a revival of interest in the lowly vehicle; but I would seriously counsel all who contemplate an expenditure in the neighbourhood of £150 to take stock of the small cars available before coming to a decision.

THE Nuremberg Motorfahrzeug Fabrik "Union" of Nuremberg, Germany, have sent us a catalogue of the Maurer-Union cars, the feature of which appears to lie in the transmission mechanism. A friction disc is carried on the end of the motor-shaft, any desired speed being obtained by varying the position of a sliding friction wheel on a cross-shaft.

THE WEBER PETROL CAR.

THE illustration (Fig. 3) shows a new petroleum-spirit motor-car that has lately been put on the market by Messrs. J. Weber and Co., of the Ateliers de Construction Mecanique at Uster, near Zurich, Switzerland. The motive power is supplied by an engine of 6 h.p., fitted with electrical ignition and a special method of releasing the compression at starting. The explosion and valve chambers are cast in one

FIG. 1.

piece, while the valves are made of a special quality of nickel, said to be unaffected by heat. The cylinder is water-jacketed, a new form of radiator being used in connection therewith. The chief feature of novelty in the new car is the variable-speed gear with which it is fitted, details of which are given in Figs. 1 and 2. In these, B is an extension of the engine shaft, while A is a counter shaft which is geared to the rear axle by pinion wheels. The two shafts, A and B, are connected by a single belt. Fixed on these shafts are discs, D and E, the faces of which are provided with a number of grooves in which the segments, S, can slide.

FIG. 2.

On each of the shafts are cones, FG and JK, free to move along the same. The cones are also connected up to the segments in such a way that as the cones are moved on the shaft one way or the other, the segments form a pulley of varying diameter. A single lever within easy reach of the driver controls the gear. Referring to Fig. 2, by pushing back the lever, L, the cone, FG, is moved toward the disc, D, and the segments, S, expand; at the same time and in the same proportion, the cone, JK, is moved

away from the disc, E, and the segments contracted. By the expansion and contraction of the pulleys any desired rate of speed can be obtained. A second lever, M, is provided, which acts only on one of the cones, tightening and slackening the belt as desired, thus serving the purpose of a friction clutch. A special type of Crypto hill-climbing gear is also provided, while the reverse

FIG. 3.—THE WEBER 6-H.P. CAR.

motion is obtained by means of a friction pulley which can, by a pedal, be interposed between the two expanding pulleys. Ball bearings are fitted to the shafts and also to the road wheels; the latter are of the cycle type, shod with pneumatic tires. The car, which weighs about 13 cwt., can, it is claimed, ascend gradients of one in five, with four persons up.

MESSRS. TRENT AND COMPANY, 199, Wells Road, Shepherd's Bush, W., have issued a neat price list of castings, parts and accessories of motor-bicycles.

A NEW catalogue of Ivel motor-bicycles has been issued by Mr. Dan Albone, of Biggleswade. It includes some delightful little views of scenes in the locality of the works.

MR. G. CALVERT, of Woodville Road, London, N., has been making some experiments with water-cooled bicycle-motors, and has arranged to introduce one having a cylinder 3 in. diameter by 2½ in. stroke at an early date.

THE Star Omnibus Company (London) is watching the developments of mechanical traction, and is anxious to obtain a successful motor-omnibus to replace horse-power. But the chairman says the directors have not yet seen a vehicle that accords with their ideas of what is wanted.

SPEAKING at the annual meeting of the Hart Accumulator Company, the chairman, Mr. G. W. Kidd, said the company was preparing to go into motor-car work, and the manager had designed a plate which he anticipated would be very useful in that connection. It was claimed to be of great electrical efficiency with reduced weight.

A FIRM of New York architects have put up a block of stables for automobiles, each of which is 18 feet in width and 64 feet in depth. On the ground floor each stable will have accommodation for six or seven cars; on the first floor will be reception rooms for the owner, and on the third storey rooms for the accommodation of the mechanic will be provided.

THE twelve cars which the Motor Manufacturing Company are sending to South Africa are being fitted with the Sirdar Rubber Company's patent buffer tires, similar to those which are being used in connection with Messrs. Thornycroft's 5-ton steam 'buses. The company's 2½ in. tires are being fitted on the Napier, Wolseley, Daimler, and other cars, the flat-top section being preferred in England. In Ireland nearly all the cars using these tires have been fitted with the 2½ in. conical section, which shoots away stones which might otherwise cut the rubber.

CONTINENTAL NOTES.

By "AUTOMAN."

THE French Government killed road-racing last year, and vowed that it should cease to exist in France, and all the Press (save the technical journals) joined in a funeral dirge with "variations." So certain did it seem that the death sentence had been passed that even the most sanguine in the automobile world had no hope. I remember a conversation I had with the Baron von Zuylen on the race-course at Berlin, whilst we were waiting for Fournier to arrive, and the talk so impressed me that I headed my article for the next issue of the *Journal* "The Last Great Motor Car Race." Fortunately, later reflection caused the striking out of this title. The same Government that less than a year ago killed road-racing has now officially brought it to life again, not only by sanctioning it, but by actually organising and promoting it. It has been, of course, on the *tapis* for some time, but it is now official, and it is surely curious reading to hear of two Government commissioners setting out to choose the routes and interview the authorities. The race is to take place in May in two sections, a racing section and a tourist section. The course will be altogether 910 kilometres (564 miles) in two stages for the racing section, and in three stages for the tourist section, over the northern roads from Paris to Arras, and thence by Doullens to Boulogne and Dieppe and back to Saint Germain. There will also be a heavy traction competition.

ROAD-RACING brings me to speak of the letter of Mr. H. A. Hector in the last week's issue of the *Journal*. Mr. Hector accuses me of "trying to throw discredit on English manufacturers," and I should not deem it necessary to reply to such a criticism, except that Mr. Hector has not followed the continual drift of my notes on this subject, nor has he noticed my oft-repeated advice to English manufacturers to come into the French racing field, and prove their equality or superiority. I should not allow myself to be dragged into a controversy as to the relative merits of the Napier or the new 20-h.p. Wolseley as compared to French cars for many reasons; but until these or any other English cars have equalled or beaten French cars in the great international races you will never get anyone outside England to believe it, and you will have a large section also in England who do not believe it until it is proved, and when it is proved one or two good results will occur: either the superior English car will get an export demand which will largely increase its sale, or the maker will have learned something valuable, and will go home and make a car to better compete with his French rival.

THIS, however, reminds me of an actual conversation I had some weeks ago with a typical English manufacturer of motor-cars. He was extolling the virtues of his new production, and he told me it was a better hill climber than any French car. I said I was glad to hear it, but I asked him how he knew it. He replied that he had been up to the "Cat and Fiddle," in Derbyshire, and it climbed the hill "like the wind." In further conversation he admitted that he had neither timed, nor measured, did not know the gradient, and had not tested the car against any other over the same course. Let someone who wants to encourage English trade offer a handsome annual money prize for the English car which wins in an international competition, and a new era for the English trade will quickly open up.

AMONGST the exhibits at the Paris Automobile Exhibition there appeared a car with a change of speed accomplished by means of expanding pulleys on the "Fouillaron" system. I confess that I looked on it more in the light of a curiosity than anything else, or within the range of practical politics. A car, however, with this system of change of speed has just accomplished a tour of 4,000 kilometres in fifteen days (about 165 miles per day) over muddy roads, and in the snow. The motor was an 8-h.p. De Dion, and there were two passengers. This car will figure in several

prospective competitions, so that the public will shortly be able to judge definitely of the efficiency of the new system.

M. MOSER, the Commissioner-general for the Government of Bosnia and Herzegovina, has issued through the *Auto-Velo* an invitation to the competitors in the Paris-Vienna motor-car race to visit his country as a kind of prolongation of the route. M. Moser has spent the greater part of his life in exploring Eastern Europe and Asia, and has written a very interesting book on the subject of the communications by land and water, and in a conversation with him the other day he assured me that, in his opinion, the automobile would shortly open up to the European public the vast resources and the beauties of these almost inaccessible and unknown regions. I allude, of course, to the Far East, for of course Bosnia and Herzegovina are comparatively known and easily reached by rail. In order to facilitate a visit to these countries it is proposed to take *chauffeurs* and motor-cars by train over the uninteresting part of the journey from Vienna. The proposition is being seriously considered by the Austrian Automobile Club.

LA Société de Construction de Moteurs et Automobiles la Minerve, Rue du Point du Jour, Billancourt, Seine, exhibited at the recent Paris Automobile Show, a voiturette driven by a 3½ h.p. vertical single-cylinder motor fitted with Longuemare carburettor and water circulation. The transmission is by chain from the crank shaft to the countershaft, and from thence by another chain to the driving axle. The feature of this system is the two-speed gear provided, which consists of an arrangement of

satellite pinions in drums, so that by putting the brake on one drum the high speed pinion is carried round, while when released the shaft revolves on the lower speed. The accompanying illustration shows an outline of the car, which is marketed at a popular price.

THE French Aero Club is seeking official permission to put down a plant at its park at Suresnes, near Paris, for the manufacture and storage of the hydrogen necessary for the inflation of balloons.

THE Paris Singer Electric Carriage Company, Limited, has been formed in London with a capital of £5,000 to manufacture, sell, and let on hire electric carriages, launches, flying machines, and their parts and accessories, etc.

At a meeting of the Academy of Sciences recently held in Paris, M. Soret reported some cases of fracture of the forearm caused by starting a motor-car. In one case there was a direct fracture at the junction of the lower and middle third of the radius owing to the blow of the crank handle on the external anterior face of the forearm, while at the same time the hand was forcibly extended. Contemporaneously the styloid process of the ulna was torn off. There was thus a direct fracture of the radial diaphysis and an indirect fracture of the lower ulnar epiphysis. There was no obvious deformity of the forearm, as the shaft of the ulna, which was intact, served as a splint to the radius.

THE CARLTON COMBINATION CARBURETTOR AND INLET VALVE.

IN a recent issue a brief reference was made to a novel combination of carburettor and inlet valve for petroleum-spirit motors that we had been shown. The apparatus, which has been designed by Mr. A. Gower, of the Carlton

FIG. 1.

FIG. 2.

Motor Company, of Cricklewood, is now being put on the market. Fig. 2 gives a general view and Fig. 3 a section (full-size) of the combination as adapted for use on a

FIG. 3 SECTION.

4½-h.p. high-speed motor. As will be seen, the device consists of a casing within which the inlet valve is adapted to slide and to make a joint on the seating provided at its

lower end. Just above the inlet valve a series of perforated diaphragms are arranged and adapted to act as baffles or atomisers. At the upper end of the valve stem a small needle valve is inserted so as to slide axially therein, it being kept in an outward position by a small spiral spring, its range of movement being controlled by a small pin inserted through the needle valve, and a slot in the stem of the inlet valve upon the uppermost diaphragm. The inlet valve is kept closed by a spiral spring outside the valve stem, on its uppermost diaphragm. Just above the needle valve is a valve seat formed at the end of the communicating pipe from the petrol tank. This seating is made adjustable to and from the needle valve, so that by the action of the spring the needle valve may be timed to open more or less later than the inlet valve, in order to regulate the character of the explosive mixture. At the upper part of the casing a perforated cap is fitted, and above this cap a rotating plate is provided, also perforated, the perforations being arranged to coincide with each in one position, and to be eclipsed by the intervening metal in the other position. The object of this arrangement is to regulate the amount of air drawn in at each stroke, and the suction for any given amount also affects the amount of liquid or gaseous fuel drawn in by such suction, a matter quite apart from the adjustment of the needle valve. A dust cap is fitted over the perforated cap so as to prevent dust being drawn into the engine. The gas inlet passage just about the seating of the needle valve is packed with a filtering material, such as wire gauze, to prevent any solid matter getting down to block the needle valve. The baffles or atomisers being made in such a manner, that, when the suction takes place, the explosive mixture is given a twist in its passage, and the liquid is broken up into such a fine spray against the atomisers that it becomes a vapour, and therefore a perfect mixture, the carburettor being combined with the inlet valve, is kept warm by the engine, this preventing any possibility of freezing in cold weather. We understand that this carburettor has been tried with petrol, alcohol, paraffin, and town gas with equal success, without any alteration of adjustment from that set for the first material used. The combination is being made in various sizes, Fig. 1 showing (actual size) a similar arrangement adapted for small engines of from 1½ h.p. to 2½ h.p. It is undoubtedly an ingenious and compact device, and if the claims made for it are fully borne out in practice it should meet with a large adoption.

THE Mid-European Motor-Wagon Association has extended its field of action to include motor navigation and aeronautics.

Automobile Topics, of New York, gives publicity to a report that the works at Marion, N.J., of the Automobile Company of America, have been sold to the Cannstatt-Daimler Company, of Cannstatt, Germany. It is said to be the intention of the German company to use the plant for the manufacture in America of automobiles of the Mercedes type.

PROFESSOR ELIHU THOMSON, of Swampscott, Mass., has been granted a patent on an ignition tube made of quartz. The quartz, which is fused at high temperature, possesses, it is claimed, certain very desirable qualities. It will stand to be heated red hot and plunged into water without breaking, on account of its low coefficient of expansion.

A SPECIAL reel for carrying a length of water-tank filling hose-pipe in a non-conspicuous position on steam cars has just been introduced by the Mason Regulator Company, of Boston, U.S.A. The reel consists of a cylindrical case 12 in. in diameter by ½ in. in thickness, adapted to be screwed underneath the bottom of the car, and holds 10 ft. of suction hose. The inner end of the hose is permanently connected to a revolving disc, which is in turn connected through a stuffing box by a pipe which attaches to an ejector leading to the water tank. To fill the tank, the hose is pulled out as far as necessary to reach the water supply, and steam is turned on the ejector. When the tank is filled steam is turned off, and the hose is wound up by turning handles on the bottom of the case.

HERE AND THERE.

MR. ROWLAND WINN lectured on "Motor-Car Driving" at the monthly meeting of the Leeds Association of Engineers last week.

A NEW folding stand for motor-bicycles has just been put on the market by Mr. W. Quibell, of 344, West Green Road, London, N.

A PROPOSAL by Mr. T. W. J. Britten that a motor-bicycle championship should be added to the Union list of honours is to be considered by the N.C.U.

It is rumoured that the policeman at one of the villages on the North Road, who has become so well-known to motorists, has been removed to another place.

MESSRS. T. COULTHARD AND CO., of Preston, have lately turned out a steam overhead wire inspection car for the Liverpool Corporation Tramways Department.

THE Scottish Automobile Club was to be afforded pleasure on Thursday, by the reading of a paper on "Experiences and Adventures," by the Lord Justice Clerk.

MESSRS. E. J. MORANT AND H. M. DENT are giving a luncheon to-day (Saturday) at the Crown Hotel, Lyndhurst, to celebrate the opening of their Imperial Motor and Cycle Works, Lyndhurst, Hampshire.

MR. E. W. WATSON, of Berwickshire, asserts his ability to carry forty-nine passengers in a navigable balloon, for which he has applied for letters patent, across either of the great continents, under any atmospheric conditions.

THE Electric Landauet Company, Limited, has been registered with a capital of £50,000, to manufacture, let on hire, maintain, keep in repair, clean, house, and generally to act as job masters in connection with vehicles driven by "human, animal, electric, hydraulic, or other power."

THE United Motor Industries, Limited, have decided to revert to their original practice, and supply only for cash, a decision which, we are informed, places them in a position to allow to the public no less than 10 per cent. off their list prices.

MR. F. BARON, A.M.I.M.E., of the Motor Haulage Company, of Manchester, has been appointed sole representative for the Chatel-Jeannin cars, described in our last issue, for Lancashire, Cheshire, Staffordshire, Hampshire, Hertfordshire, Surrey, and Middlesex.

MESSRS. BRAMPTON BROS., LTD., Birmingham, have sent us a copy of a reference sheet of their cutters for the milling of chain wheels for motor-cars. The cutters are made in a variety of sizes, and the sheet, which is mounted on linen, should be found useful by all builders of automobiles.

FOR some time past Algeria has been a happy hunting ground for large numbers of French and Belgian motoring tourists. With the view of furthering the movement it is now proposed to form the North African Automobile Club, with headquarters at Algiers.

MESSRS. W. J. BISHOP AND COMPANY, of 88, George Street, Croydon, are making a speciality of portable accumulators for

ignition purposes. They are specially intended to stand vibration without detriment, and, having terminals raised on insulating washers to prevent corrosion, seem well adapted for the purpose.

THE wholesale catalogue of Messrs. J. Lucas, Limited, of Birmingham, for 1902 has just been issued. Lucas's "Motoralities" include lamps, motor-cycle lamps, back lights, lamp brackets, horns, pumps, wrenches, valves, jacks, etc. Included in the lists are particulars of the firm's motor outfits for repairing detachable pneumatic tires. A small edition of the price-list is also issued in a very handy form.

THE New Rossleigh Cycle and Motor Company, Limited, have purchased the buildings, works, plant, stock, and goodwill of the Scottish Motor Company, at Hope Crescent, Edinburgh. The company will cater for all branches of the motor trade. The public service of cars will be extended, and in addition to the sale of cars and motor accessories, and of private hiring, an efficient staff of repairers will always be in attendance.

THE following from the *Daily Telegraph* will amuse some, and hurt none, of our readers:—"The motor industry shows a further tendency towards commodious and powerful cars on the one hand and cycles simply fitted with motors on the other. A decided reaction has set in against the fitting of cheap foreign motors, and manufacturers are finding out they can make the engines themselves with far more satisfactory results."

THERE are probably as many accidents due to people who drive horses or ride cycles without sufficient caution as to those who are in control of motor-cars, says the *Morning Leader*. And such accidents as do occur are more often due to the recklessness of drivers—who would have no difficulty in qualifying for a licence—than to the incompetence of beginners; so

that the plan suggested by Mr. Henniker Heaton, M.P., would be futile.

AN advance list of ball bearings for automobiles has been forwarded by the American Ball Bearing Company, of Cleveland, Ohio. This company owns the Baker patents on anti-friction ball bearings, and it is pointed out that all the parts are made on the interchangeable system. Attention may well be drawn to the self-aligning "motor bearings" for electric vehicles, which secure efficiency without the scrupulous carefulness that is ordinarily required. Self-aligning bearings are also specially designed for use on the rear axle of motor-cars, and are particularly intended for the tubular axle construction with bearings at each end.

ON page 7 we give a reproduction of a photograph of the new car recently introduced by Messrs. James and Browne, of Queen Street, Hammersmith, and which attracted much attention in the last Southsea run. The vehicle, mechanically speaking, is on original lines throughout. The motor is of 8 h.p., and comprises two horizontal water-cooled cylinders, the fly-wheel being set in the centre of the frame, with a movement in the same direction as that of the car. Four speeds are fitted, actuated by one lever, and the gear wheels are exceptionally large and strong, the teeth being $1\frac{1}{2}$ in. wide. Special attention has been devoted to the question of lubrication and brake power. The internal brakes on the rear wheels were described and illustrated in our issue of February 22nd last.

THE BENZ 10-H.P. TONNEAU (see page 5).

MOTOR-VEHICLE REGULATIONS.

THE General Council of the Automobile Club has issued a statement with regard to (a) the restrictions as to speed in respect of light motor-vehicles; (b) the restrictions as to tare weight and the width of heavy vehicles used for commercial purposes, from which we take the following extracts:—

"We agree with Rt. Hon. Lord Thring, K.C.B., in the opinion which he expressed that there is no worse law than a law which is not respected. In view of the powerful brakes with which all motor-vehicles are fitted, and the perfect control which drivers have over motor-vehicles, it is evident that the existing law which provides that even on a clear, straight road, devoid of traffic, a light motor-vehicle must not be driven at a speed greater than twelve miles an hour, does not command, and cannot command, respect or observance.

"Careful observations made in our big cities and their suburbs show that electric and steam tramcars are driven at speeds up to eighteen miles per hour. Recent experiments have shown that motor-vehicles can be stopped on the flat on a fairly dry road when travelling at the undermentioned speeds, as follows:—

From 11 to 14 miles per hour in $1\frac{1}{2}$ times the car's length.

From 15 to 17 miles per hour in twice the car's length.

From 18 to 20 miles per hour in $2\frac{1}{2}$ times the car's length.

From 20 to 24 miles per hour in $3\frac{1}{2}$ times the car's length.

"The figures given are averages. As a matter of fact, one car travelling at 13 miles per hour was stopped in 4 yards; another travelling at $18\frac{1}{2}$ miles an hour was stopped in 7 yards, and another when going at 20 miles an hour was stopped in $12\frac{2}{3}$ yards. The average weight of the vehicles, without passengers, was one ton four hundredweight. From these results it will be seen that motor-cars can, on an average, be stopped when travelling at 20 miles an hour in less distance than the ordinary horse vehicle could be stopped when travelling at 10 miles per hour.

"The law, therefore, which prohibits travel on light motor-vehicles at a speed in excess of 12 miles per hour under any circumstances, and the systematic prosecutions and heavy fines imposed for technical offences against this law, cannot but fail to damage in this country an industry which is encouraged on the Continent and in the United States of America, and which, if unencumbered by unnecessary legislation, should provide in this Kingdom work at good wages for many thousands of men.

"First, we claim that the specific speed-limit imposed under the Act of 1896 should be removed; secondly, that provided the existing speed-limit be abolished, and that only such restrictions are placed on motor-vehicles as may be reasonable and proper for the safety of other users of the road, the proviso of the County Councils' Association, viz., 'that there should be an easy and complete means of identification,' is one to recommend itself to all drivers of motor-vehicles, with perhaps the possible exception of cars which are not capable of being driven at any except slow speeds.

"The Act contains oppressive restrictions for which no rational justification exists in regard to the tare weight and width of another class of vehicles—the motor-wagon for conveying heavy goods—the development of which manufacturing industry is not less important than the manufacture of passenger vehicles, in view of the great benefits which heavy motor haulage is able to confer on the inhabitants of districts still unprovided with railways, whose industries are hampered and often destroyed by the prohibitive cost of cartage. The restriction to a tare weight not exceeding three tons is now preventing the manufacture and employment in the country of motor-wagons, which would be capable of carrying loads up to ten and twelve tons, and the use of which would reduce the cost of motor haulage to about one-third of the cost of horse haulage, thus practically extending the benefits of railway communication to every part of the country. The present Act also comprises useless restrictions on the speed of motor-wagons, which prevent the development of the use by farmers and land-owners of motor-wagons, which would otherwise enable them to send vegetables, fruit, and other perish-

able goods direct to market without the risk and damage of the double transfer from road to rail and again from rail to road."

"We are of opinion that automobilists should have a ready form of appeal against decisions arrived at by Benches of county magistrates.

"We urge upon your readers to secure that their representatives on the County Councils and their representatives in the House of Commons should lose no time and spare no effort to induce His Majesty's Government to pass a Bill which would remove without delay the unnecessary and damaging restrictions which at present hamper mechanical traffic in this country, and, by providing for the identification of motor-vehicles, prevent the dangerous or inconsiderate driving which is indulged in by a minority of motor-drivers, and which has undoubtedly tended, in some instances, to bring the automobile movement into disrepute. The Bill might also provide an increase in the penalties for infringement of the law, if at the same time it provided for the ready form of appeal before alluded to."

A USEFUL TERMINAL CLIP.

MESSRS. ACCLES AND DE VEULLE, of Birmingham have lately introduced a useful little novelty in the shape of a special terminal clip for ignition wires, which should overcome the trouble of wires becoming disconnected owing to vibration or jolting. The accompanying illustration shows the new clip and its application

so clearly that no description is necessary. It need only be mentioned that it is pressed out of a single piece of brass, and is made in sizes suitable for the wires of both the primary and secondary circuits. The London Autocar Company, Limited, are the sole agents for London and the south for the new clip.

M. EMILE MORS is quoted to the effect that last year his firm turned out 350 vehicles, which output they expect to double this year.

THE Wolverhampton and Dudley Breweries, Limited, are about to utilise a steam lorry for the conveyance of heavy goods over the hilly roads between Wolverhampton and Dudley.

ON the main road between Kendal and Keswick, and between the towns of Windermere and Ambleside, is the Bridge Iron Works, owned by Mr. W. A. Fell, who is prepared to repair motor-cars. He has just commenced to stock petrol for the convenience of motorists travelling in the Lake District.

THE LOHNER-PORSCHE COMBINATION PETROL-ELECTRIC CAR.

OUR illustration shows a combination petrol and electric car that has recently been brought out by Messrs Jacob Lohner and Company, of Vienna. The frame of the vehicle is on the general lines of the Mercedes car, a 16-h.p. German Daimler motor being fitted in the fore part, under a bonnet. Instead, however, of the motor operating a change-speed gear, as in a petrol car, it actuates a dynamo, and this in turn operates electric motors on the Porsche system contained in the hubs of the two front road wheels. A small battery of accumulators is also fitted to the car, which is charged by the petrol motor and dynamo when the whole power is not required to propel the vehicle. The energy stored up in the accumulators is made use of at starting, and also when driving through crowded traffic; thus it is possible to stop the engine entirely, and still keep the vehicle in operation, and as it then will run as quietly as an electric car, there is no danger of frightening horses, etc. Instead of the usual change-speed lever, a controller is fitted, which, acting

THE LOHNER-PORSCHE COMBINATION PETROL-ELECTRIC CAR.

(Die Allgemeine Automobil Zeitung.)

on the electric motors, enables any desired speed up to, it is claimed, fifty-five miles an hour to be obtained. The petrol tank has a capacity sufficient for a continuous run of nine hours. The weight of the car complete, without water or petrol, is one ton four hundredweight. The wheel base is very long, and the centre of gravity low, so that there is no danger of the vehicle overturning. The advantage claimed for the combination arrangement is increased efficiency, Messrs. Lohner stating that there is an increase of 25 per cent. in the power given off at the road wheels in the combination car as compared with an ordinary petrol vehicle. The car is stated to be specially useful for military purposes, as, in addition to being able to travel at a good speed, it can be used, by reason of its electrical equipment, for the lighting of projectors or hospital bases, up to 200 16 c.p. incandescent lamps. The vehicle illustrated has covered a distance of over 3,000 kilometres with such satisfaction that for the coming season Messrs. Lohner have decided to construct a number of these cars fitted with petrol engines of 25 h.p., one of which is to be driven by Herr Porsche in the forthcoming Nice-Abazzia race.

MOTOR-CAR SERVICES.

OUR recent references to the interest taken in automobiles by railway managers have attracted considerable attention, and Mr. Mark Doney, of Cramlington (Northumberland), writes us an admirable letter on the subject, in the course of which he says:—"The district in which I reside is the thickly-populated coalfield of north-east Northumberland, and the only passenger railway passing through it is the North-Eastern, which for a very long period has enjoyed a profitable monopoly. Some of our large villages of 2,000 inhabitants and upwards are miles distant from any railway, and it is for such places that I have advocated motor-buses. There is a scheme projected to serve some of the towns and villages with an electrical tram service, but as this is a very large undertaking, which will take years to mature, and then leave some districts untouched, I am of opinion that motor-buses, to carry from twenty to forty persons, will meet the requirement and supersede and relieve the much-abused and over-worked horse. It is positively painful to see horses in summer time

attached to a wagonette carrying from eight to twelve passengers. This part of Northumberland, being generally level, affords a splendid field for motor-carriages, and the County Council are gradually widening and improving the main roads. There are one or two suggestions which I wish the County Council would adopt—viz., to cut down the hedges low at sharp turns in the roads, and 'exalt the valleys' where it can be done without visibly affecting the rates." Now that the London omnibus companies are making important experiments, with a view to the supersessions of horse-drawn vehicles by motor-buses, there will probably be other localities where the subject will attain prominence. Hitherto the public services at seaside towns do not appear to have been uniformly successful—although that at Bournemouth has been a conspicuous exception—but with the improvements recently introduced and a time-table rigidly adhered to, there is no reason why populations similarly located to those referred to by Mr. Doney should not be served by efficient motor-vehicle services.

THE Long Island Automobile Club is organising a series of lectures or short talks on motor-car topics.

THE USE AND CARE OF ACCUMULATORS.

AN electric spark has, up to the present, been found the most readily applied and adaptable agent for firing the charge in the cylinders of motor-car engines; and although for large-powered cars some experts prefer tube ignition, yet for small cars and motor-cycles, which will always be most in evidence, electrical ignition is universally adopted. Although magnetos and dry batteries each have their advocates, the source of current which finds most favour is a secondary battery or accumulator, and it is thought that to many motorists a few notes on the use and charging of accumulators will be acceptable.

The driver who is using an accumulator for the first time, having previously used dry cells, finds some difficulty in determining when his battery has run down, or what proportion of its original charge is still available. Suppose his engine keeps missing fire, and he suspects the accumulator is nearly run down. He pulls up, and perhaps puts his ampèremeter across the cell terminals, as he was wont to do with the dry battery. The pointer jumps violently to the end of the scale; clearly there is plenty of current here, and after looking in vain for anything

DIAGRAM OF CHARGING BOARD.

a LAMPHOLDERS. b SWITCH. c CHARGING TERMINALS.

else wrong, he starts off again, to find after a few hundred yards that he is not right yet. A two-cell accumulator gives a pressure of 4.4 volts when fully charged, falling gradually to 3.6 volts, when it may be considered empty; it will not give much after this. Yet when an ampèremeter is connected to the terminals a big current is shown, and the driver, not unnaturally, thinks there is plenty available for his coil. The reason for this is that an accumulator has very little internal resistance, while that of a dry battery is comparatively large. The ampèremeter, too, has practically no resistance, so that although the voltage of the accumulator is low, yet it meets with so little opposition that it is able to send a large current through the ampèremeter. Now when a dry battery is tested in this way, the current is limited by the internal resistance of the cells themselves, and no harm is done, provided the connection is not made for more than a few seconds; an accumulator, however, should never have an ampèremeter connected directly to its terminals, for this is simply "short-circuiting" the battery, and may damage both it and the meter. It is no uncommon thing to see a driver or mechanic deliberately short-circuit an accumulator by bridging the terminals with a file, spanner, or anything handy, just to "see the sparks." I recently saw a mechanic connect the terminals of an accumulator with a piece of stout wire. As it gradually grew red hot, he smiled complacently, as though it were a pleasing achievement, and when I ventured to suggest that it was not fair treatment he appeared quite hurt. Of course, it is due to ignorance, but such experiments are none the less ruinous, and must not be indulged in if accumulators are expected to give useful service for a few years.

It will be evident, therefore, that the current an accumulator will send through an ampèremeter (and this may be very great) is neither a measure of the current it will send through a coil, nor an indication of the amount of charge still left in the cell. To determine this latter a voltmeter should be used. It is not, however, sufficient to read the "open-circuit" voltage of the accumulator (*i.e.*, when it is doing no work); it should be sending a current through the coil at the moment the reading is taken. Therefore close switch and interrupter, and turn engine till trembler blade (or commutator) makes contact. The current will then be flowing through primary of coil, and the reading will give an indication of the charge still left in cell. If 3.5 volts or under (for a four-volt accumulator) it is practically discharged, and the "spare" should be connected up, the other one being charged at the earliest opportunity. Accumulators left discharged for long periods deteriorate considerably, owing to the conversion of some of the active material of which the plates are composed into insoluble sulphate of lead. If a voltmeter is not available, an approximate test can be made by connecting a small electric lamp to the cell terminals and observing its brightness, the lamp burning dimly when the cell is nearly discharged.

Terminals and other exposed metal work in the neighbourhood of accumulators should be smeared liberally with vaseline, which is an excellent protection against acid fumes. Accumulators can be conveniently charged where electric light is available, provided that the current is *continuous*, not *alternating*, one or two incandescent lamps being placed in the circuit to limit the current to the required amount. It is advisable, however, to requisition the services of an electrician when arranging a charging circuit, as a novice tampering with electric light wires may do considerable damage. An electrician will fit up a charging board, having on it two or three lampholders, a switch, and two terminals to which the accumulator is connected. The positive one should be marked "X," and care taken that the similarly marked (positive) terminal on accumulator is always connected to this. It will be seen from the accompanying diagram that the current has to pass through the lamps on its way to the accumulator, these regulating the amount of charging current. The charging current should generally not exceed one-fifth of the capacity of the accumulator, so that for a cell of the size generally used for quads and small cars, which have a capacity of 12-14 ampère hours, a current of a little over two amperes is required. This will be obtained by placing two thirty-two candle power lamps in the holders. This is presuming the pressure of supply is 100 volts, or thereabouts; if 200 volts, double the candle-power in lamps will be needed to pass the same current. A smaller current will be equally effective, but the charging operation will take proportionately longer. When charging at the above rate about eight hours is required. When the cells are nearly charged gas will be given off, the acid appearing to boil; this action can be distinctly heard. The vents at top of cells should be taken out during charging, to permit the free egress of gases, and any acid which may have bubbled out carefully wiped away, as a film of acid on top of the cell forms a leakage path for the current and is most destructive to the positive terminal. A little water must occasionally be poured into accumulators to make up for evaporation and keep the acid level above the plates. Once a year the liquid should be completely emptied out, and the cells refilled with pure brimstone sulphuric acid, diluted with water to a specific gravity of 1.175 degrees. This strength is roughly obtained by mixing one part acid with four parts of water by measure, the acid being poured into the water, and not *vice versa*, as the great heat generated by the first drops of water may be sufficient to split the mixing vessel.

Accumulators, owing to the large current they will give, are, in the writer's opinion, more positive in their action than dry cells, have a much longer life, and, for equal power, are lighter. Their life, however, is immensely shortened by careless usage, and it is well to bear this fact in mind, and give the accumulator at least the care its importance merits.

ALBERT E. OAKLEY.

CORRESPONDENCE.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A few words on my experiences may perhaps help to throw some light on some of the questions now much discussed by motor-cyclists and converts. I find that a 2½ inch bore by 2½ inch stroke, with two 6 inch discs, gives a motor powerful enough to take one up the average Sussex and Kentish hills without pedalling, and, in this all-important question of power, the necessity of convenience in handling the machine must not be lost sight of. Superfluous increase of power means vast increase of weight throughout the whole machine; the average motor-cyclist does not wish to be always hampered with a cumbersome and unwieldy machine in order to be able, now and then, to negotiate a few miles of Alpine track. Experience has proved to me, and many others, that narrow phosphor bronze bearings are out of the question with a high-speed motor, so that I have adopted hardened steel bushes, with broad bearing surfaces throughout—including the connecting rod; this means everything in the power and life of the motor. A chain driving direct transmitted the power too irregularly, causing a jerky strain on the bicycle and tires, to say nothing of the rider. A speed-reducing gear I find chatters considerably. A belt, however, allows just the necessary amount of play, and if a properly grooved and roughed pulley is used there need be practically no loss of power by slipping.—Yours faithfully,

A. E. BOOKER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“J. A.” in your issue of March 1st asks for impartial information as to a satisfactory motor-bicycle. I may say that I was for some time unjustly prejudiced against bicycles fitted with motors, which is the best way to describe the first so-called motor-bicycles. It is only just lately that I have been able to thoroughly test an Ariel motor-bicycle, and I must admit that I was surprised and delighted with the running of the machine. To anyone who has had previous experience with internal combustion engines and electrical ignition, I can see no difficulty either in driving this and similar machines, or in doing all necessary road-side repairs.

There is no vibration due to the motor except at low speeds, say below eight miles an hour. Another great advantage in these belt-driven machines is that the only noise is due to the exhaust, and that is very slight, unless the throttle valve is fully open, which is very seldom necessary.

In muddy weather I do not find that with ordinary care the machine skids any worse than an ordinary safety fitted with the same size tires. I may conclude with the advice to all riders of this type of machine to carry, besides the usual spare parts, a spare belt, or at least a part of one, and fasteners. These precautions having been taken, I cannot see what is to prevent one from using a motor-bicycle for touring and indeed all-round work with perfect trust in its reliability.—Yours truly,

CONVERTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to “J. A.” in your issue of 1st inst. re motor-bicycles, I am sorry to see that he has been unable to make a machine go more than fifty miles at a stretch. If a motor-bicycle will go and work well for fifty miles it will go 5,000, providing it receives fair usage, and I consider that any rider with average common sense will find the motor-bicycle as reliable as a car for touring, and go for at least 200 miles in a day without adjustment.

I myself have ridden the Werner; in fact, have had all patterns from the first electrical ignition, and have only had to make two railway journeys in 10,000 miles, and I have done 200 miles and over in a day. I have only had to pay for such things as new belts, etc., and I feel certain what one rider can do so can another with a motor of decent make. But I will say, if a rider is so helpless as to be unable to adjust a trembler or shorten the driving belt, he had better leave motoring alone.—Yours truly,

HENRY KENNETT, JUNR.

MOTOR-BICYCLES FOR LADIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am thankful to Mrs. Kennard for the honest criticism that she bestows upon ladies' motor-bicycles in your columns, but at the same time I much regret that I was denied the pleasure of a personal interview with that lady, for I feel certain that some of the points in which she thought the Phoenix was deficient would, after my explanation, appear in a different light.

Taking the first remark, concerning the inability of removing the exhaust valve without burning the fingers owing to the close proximity of the exhaust tube, Would not the valve be as hot as the tube, and require cooling down in the rare event of its having to be removed shortly after the stoppage of the engine? The said tube is so fixed that its removal is a far easier matter than the removing of even the valve, and the reason of the tube being there at all is to carry the exhaust right away under the machine, a point which evidently has been overlooked by Mrs. Kennard, for the fact of the silencer being in a position where it would be covered by a lady rider's skirt in some machines does not seem to have occurred to her. The chain cover also, I could have shown, was only sprung on, and could be instantly removed.

The exhaust valve lifter might appear to be placed too far away, and this, I would like to have pointed out, merely requires a touch of the thumb, and

is placed so as not to obstruct the grip of the handles. As to its being questionable whether it is an advantage to do away with the switch handle, it is far easier to interrupt the current by a mere touch of the thumb and have a firm grip on the handles than by the usual rotating handle, besides having the command of freeing the engine by means of the exhaust lift by a little further movement of the same thumb lever.

With the necessary open frame to accommodate a lady's skirts there is not much room to waste, and it takes a good deal of ingenuity to give a fair quantity of petrol space, and also pack away the accumulator, coil, carburettor, lubricating tank and pump without in any way having any projecting attachments on the machine; and, after all, appearance does have to be studied if the machine is expected to become a favourite with the ladies.

With regard to your correspondent “J. A.,” he seems to have been singularly unfortunate in his experience of motor-bicycles, and I cannot help thinking that his idea of weight—60 lbs. gross—probably has something to do with the results he has so far obtained. By looking for a machine light in weight, there is just the risk that he has overlooked the points which are really essential in a touring machine. True many of us are enthusiasts, but all cannot be called mistaken, and some machines at least have done good work. Personally, I have undeniable proof of riding a motor-bicycle from Land's End to Linton, 91 miles, without any hindrance, and after losing over half an hour, reaching Exeter, 124 miles, in 6½ hours. Devon and Cornwall are about as bad for roads as a tourist can expect.

I am merely quoting this ride as an instance, but I know of many good performances that have been done, not racing, but merely touring for pleasure. Motor-bicycles are not yet by any means perfect, and at times, when submitted to extraordinary tests, have been known to fail. At the same time, even now the majority of these handy machines can afford the purchaser a vast amount of pleasure, if he will only make up his mind to understand what it is that makes the wheels go round.—Yours faithfully,

J. VAN HOODYDONK.

CORRECT HORSE-POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent “Uncertain Horse Power,” I would like to say that I have driven cars fitted with the so-called 5 and the 8 h.p. M.M.C. engines. Early in the season I had the former, and, being rather anxious to see what the 5 h.p. engine developed, after one or two little improvements had been made, I had it put on the brake. It was found to develop 6·2 at 1,450 revolutions. I sold that car and gave the order for a car fitted with 8 h.p. engine, and this developed 8·5 at the same number of revolutions, so that the 8 h.p. claim is within all reason. What the makers call it is not much to do with me; I am satisfied that my present voiturette is 8 h.p., and, as it has now run about 5,000 miles without anything happening, except the replacement of inlet valve seating washer, I consider that it is satisfactory.—Yours faithfully,

F. GUY LEWIN.

QUERIES re BELT-DRIVEN CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers afford any information as to what is the best and most economical method of driving a belt-driven car down hill, both as regards saving of petrol, wear and tear, and cooling? I, of course, mean an ordinary hill, where one is not obliged to use both compression and brake to keep the car steady. Is it best to throw the belt on to the loose pulley and let the car run, or to close the throttle and run on the compression, or can some kind of valve lifter be fitted to take off compression, and so keep the belt on fast pulley, letting the car drive the engine?—Yours truly,

H. ELLIOTT.

QUERIES re STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am unable to give “Rusticus” any information about the Clark apparatus, but I will endeavour to answer his other queries. First, a steam car boiler of the “Locomobile” type, for some unexplained reason, does not fur to any appreciable extent, even with hard water. Second, a steamer (Locomobile) will climb any hill that a horse and trap can climb, with two passengers up. I have frequently taken two friends and myself, total weight about thirty-six stone, in a two-seated Locomobile up a lengthy hill, with an average gradient of one in ten, with power to spare. If “Rusticus” cares to purchase a Contour Road-book of England (South-East division) he will be able to select his own test hill, and he will have the satisfaction of knowing exactly what the gradient is and having a very useful book when he becomes, as I hope, a fellow “Boulder on a Boiler.”—Yours truly,

RICHARD SLATER.

THE CONVERSION OF TRAMCARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is one project on which I would like to have the opinion of your readers, and it is with regard to the adaptability of motors to cast-off tramcars, thus transforming them into motor buses. For instance, Newcastle has sold all its tramcars and adopted a new and complete trolley system of electrical trams. Some of the old cars were nearly new, and in excellent condition, and to me it seems a great pity that they should rust and rot. Could they not be fitted with one pair of hind wheels, and the front end of car placed upon a four-wheeled bogie motor of, say, 12 to 16 horse-power? So far as my knowledge goes at present, I should think a

steam-propelled engine would be best adapted for this purpose.—Yours truly,
MARK DONEY.

GREASE FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In an article which recently appeared in the *Morning Leader* enumerating the defects and shortcomings of motoring, one great nuisance mentioned was that of dropping a gravy-like fluid in a stream on the road—a reference to the working out of the oil from the gear-box. When I say oil, this requires some qualification, as it is usually grease when put in, but is beaten up into an oil by the rapid motion of the cog wheels in the gear-box. Motorists should be careful to avoid this nuisance by using a proper grease, viz., one which will not melt under the heat generated by the rapid friction of the cog wheels.—Yours truly,

HENRY HARRIS.

AXLES ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased indeed to notice that you referred to the one-sided strain, and in fact severe strain, upon the springs of motor-carriages driven without chains and direct from the engine to the back axle. There is no doubt about it that all the carriages of this type that were on the market last year suffered from the defect you mentioned, and that now the manufacturers are trying to put large horse powers into this type of carriage this defect will be much accentuated. I think, however, it is only fair to point out that De Dion Bouton's vehicle with the direct drive has not this defect owing to the "cardan" axle principle, which enables the gear-box to be absolutely firm and rigid with the frame, and places no side strain upon the springs.—Yours faithfully,

J. W. STOCKS.

W. V. writes:—"Will any of your readers say if there is any reliable formula for finding what the effective or b.h.p. of a motor-engine ought to be; where the diameter of cylinder, stroke of piston, and number of revolutions are known. If there is no reliable formula, what is the best method to obtain the desired results?"

With reference to the offer of Mr. S. F. Edge to run a Napier car 200 miles a day for some considerable time, a reader of the *Journal* has written offering his services in certifying as to weight, etc.

FURIOUS DRIVING CASES.

R. H. HENDERSON, of 15, Calthorpe Street, Gray's Inn Road, W.C., was summoned at the King's Heath (Birmingham) Police Court for furiously driving a motor-car on the 14th ult. Police-sergeant Burford stated that on the day in question he was on duty on the Pershore Road, King's Norton, when he saw the defendant coming down Church Hill at a tremendous rate—exceeding twenty miles an hour. Witness shouted to him to go steadily, but he took no notice, and continued at the same speed. Shortly after he had passed witness he nearly collided with a butcher's cart. When defendant was climbing the Station Hill the motor stopped, and witness then caught up with him. Defendant explained that the reason he was going so fast was that "the frost had frozen the carbon." Arthur Foster, the butcher's boy referred to, said that he had never seen a motor-car go so fast before. It nearly ran into him. Superintendent Chare having remarked that the police had no means of stopping the cars, the Bench fined defendant 50s. and costs.

LEON VINT, of Leon Vint's Globe Choir and Scenorama, has been fined £10 and costs for furiously driving a motor-car near Cheltenham. One witness said the car was travelling at the rate of between thirty and forty miles an hour, and a police-constable said the pace was between twenty and thirty. The defendant, who wrote from West Bromwich, said he had sold the car and was riling with the purchaser. He denied that the pace was so great.

THE WESTON STEAM DOG-CART.

At Plymouth Police Court, Peter McCall was summoned for furiously driving a motor-car in Beaumont Road on [December 14th. Mr. P. T. Pearce, for defendant, said the chief constable Mr. Sowerby informed him that since the original summons was issued there had been an improvement in regard to the speed at which motor-cars were driven. Whilst unable to admit that the car in question was being driven too rapidly, he was quite content, if the chief constable withdrew the summons, to abandon his claim for costs, amounting to about £5. The managers of these cars would not for a moment tolerate any unnecessary or improper speed, and they had warned their drivers that if they drove the cars unduly fast they would be subject to punishment. The chief constable said there had been an improvement in regard to the rate of speed, but there was still much ground for improvement. The case was further adjourned for a fortnight. The summons against William James Welshman, at the same Court, for driving a motor-car at a greater speed than eight miles an hour in Union Street on February 5th, was adjourned until next Wednesday.

ALLEGED NEGLIGENCE.

IN the Westminster County Court, on Monday, Judge Woodfall heard a claim by Miss Lilian Mabel Guild, of Windsor, to recover from De Dion-Bouton (Limited), of Regent Street, damages for personal injuries sustained through the alleged negligence of their servant. It appeared that Miss Effie Evans, journalist, of Cincinnati, Ohio, was staying at the Savoy Hotel, and the plaintiff became her guest there. Miss Guild had accepted a situation in Albemarle Street, at a salary of 25s. with commission on business introduced, that brought her average earnings up to £4 weekly. The two ladies had been invited to a motor ride on October 12, and the car was driven up to the Savoy for them. As they turned on to the Embankment the car-driver lost his head, and stopped in front of a hansom cab, and the car upset. They were rescued, and plaintiff, who felt ill, returned to the Savoy. She had not recovered from the shock now, and had been prevented from earning the £4 a week. Living at the hotel cost £3 2s. a day, and there was the doctor, at a guinea a visit, nurse, massages, etc., in addition.

The defence was that the cabman caused the accident and drove away before his number could be taken. The car-driver was experienced in Birmingham and London, and behaved in the best way possible. Miss Evans said at the time he was not to blame. Mr. R. J. Drake, counsel for the defendants, commented on the heavy items of the claim—£136 for hotel expenses alone—the total amount being £270. His Honour found the defendants' driver was negligent, and assessed the damages at £185, finding for the plaintiff for that amount with costs.

INSUFFICIENT LIGHTS.

FREDERICK CRACKNELL, a motor-car driver, was summoned for driving a motor-car at Eton on February 5th, without showing a red light in the reverse direction to which he was travelling. The constable stated that there was a head light on the car, but the two side lamps, which showed a red light in the rear, were out. Defendant said they must have been shaken out by the bad road between Slough and Eton, and the powerful head light he had on prevented him from noticing it. Fined 10s.

A CORDIAL invitation to M. Santos Dumont to bring his airship to Llandudno has been sent by the local Improvement Association, who point out that Great Orme's Head is convenient for launching and the bay suitable for manoeuvring his aerial craft. The aeronaut is now in London on a short business visit, and hopes to make an ascent from the metropolis in May or June. On Tuesday he dined at the Royal Thames Yacht Club with Mr. Frank Butler, among the other guests being Sir Vincent Barrington, the Hon. C. S. Rolls, Mr. Pollock and Mr. Leslie Bucknall.

COMMENTS.

AT the close of the Automobile Club's Exhibition at the Agricultural Hall in April next, notice will be given by the proprietors, the Messrs. Cordingley and Co., to terminate the present agreement with the Automobile Club.

Roads in Europe.

THE Secretary of the Roads Improvement Association, Mr. Rees Jeffreys, took the opportunity of a recent lantern lecture on "Alpine Cycling" to compare English roads with those of other countries, and not at all favourably. Here we had, he said, either mediæval trunk roads that took the hills as they came, or turnpikes made for the particular convenience of local landlords. Like other travellers, he had found the Swiss roads much inferior to those of France, Austria, and Italy, and as a road user he wished that the French had continued to rule the country after Napoleon's time; a marked contrast was found in the state of the roads as one crossed and recrossed the frontiers. The gradients were, however, in all cases easy and skilfully engineered, the only dangerous portions being at the bends of the *tournequets*, many of which are rendered less risky by judicious banking up.

Motor Tracks.

MOST of the well-known lovers of horses have come round to the side of automobilism, and very gratifying is the support accorded to the movement by leading members of the aristocracy. The Duke of Portland has given directions that the twist in the road at Welbeck shall be removed in order that the road may be used by the Automobile Club for speed contests. Lord Suffield's estate near Cromer, and the Earl de la Warr's private road at Bexhill have also been placed at the disposal of automobilists—thus furthering the idea of a motor-car track whereon trials and races may be possible. In early issues of the *Journal* this idea was elaborated, and probably the proposal may ultimately lead to something definite and tangible. We hear that the Earl of Radnor is making a magnificent drive at Folkestone. The road is to be 100 ft. wide, and will include two carriage drives besides a "gallop" 30 ft. wide for horse-riding. Why cannot something of the kind be provided for automobilists?

Another Hint on Motor-Houses.

A RECENT idea for the due and sufficient warming of a motor-stable, in process of being carried out, consists in its combination with a greenhouse, the latter adjoining the wall of the former, while the same heating apparatus serves for both. Perhaps if such a combination became popular we might have a chance of seeing parades of decorated cars, a spectacle which, in spite of one or two attempts, has not caught on in this country, picturesque though it be. And when the "petrol springs," once referred to in a contemporary, give out, the owner might alter his carburettor and grow his own alcohol. Joking apart, though, the idea is not a bad one, and might often be a convenient arrangement.

The late Mr. Bryan Donkin.

WE regret to learn of the death of Mr. Bryan Donkin, which took place at Brussels last week. He was born in 1835, and educated at University College, London, and the Ecole Centrale des Arts et Métiers of Paris. He then entered the engineering works founded by his grandfather at Bermondsey. Mr. Donkin made extensive investigations in thermo-dynamics, and amongst the results were important improvements in the steam engine. In recent years he had devoted much attention to explosion motors, and had taken a great interest in the automobile movement.

Motor-Car Imports and Exports.

THE Board of Trade returns for February being now to hand, we hasten to publish the figures relating to the imports and exports of motor-cars and cycles. To deal first with the exports of automobiles of home manufacture, the shipments during the past month amounted to twenty vehicles, of a value of £6,379. Of parts, the exports attained a value of £190, making a combined total for February of £6,569, as compared with £10,992 in January last. As regards the imports of foreign cars and cycles, these of course show larger figures. In all, 213 cars and cycles were imported into this country last month, the value of the same being returned at £47,759. The value of the 'parts thereof' is given as £4,923, so that we get a combined total of £52,682, as compared with £43,855 in January last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised sixteen vehicles, amounting in value to £3,216, and £972 of parts, bringing down the net imports in February to £48,494. During the first two months of the current year British imports of foreign automobiles have reached a total of just under £90,000.

The Wolseley Works.

IN the annual report of Vickers, Sons and Maxim, Limited, the attention of shareholders is particularly called to two of the firm's subsidiary companies which were acquired during last year, viz., the Electric and Ordnance Accessories Company, Limited, and the Wolseley Tool and Motor-Car Company, Limited, of Birmingham. The latter firm start the present year with most favourable prospects, and with orders that will find them full employment till late in the year. Their works are now turning out one motor-car per day, and it is hoped shortly to increase the output.

A Pioneer at Sheffield.

AMONG the flour milling firms at Sheffield Messrs. Price and Sons, of the Town Mills, Millsands, deserve recognition as being the first firm in that trade in the great cutlery centre to adopt a motor-vehicle in their work. This is a five-ton dray, similar to that by which the Lancashire Steam Motor Company, Limited, won distinction in the Liverpool trials. It is not the intention of Messrs. Price and Sons to use it for their town traffic, as the first cost is said to prohibit its economical employ-

ment on short journeys, but they expect to effect a great saving on country journeys over four miles long, and in working hilly districts, which will, no doubt, be to the mutual advantage of themselves and their customers. It is satisfactory to observe that the Sheffield newspapers, in referring to the innovation, testify to its quiet and easy running, and to the fact that "horses take little notice of it."

Tracks in Parks.

PENDING the time when every holiday resort—if not every town of any importance—will have its motor-track, a correspondent suggests that arrangements might be made to allow motorists to indulge in fast travelling in the parks at certain hours. Writing from Dulwich, he points out that Dulwich Park has a ring-road very nearly a mile round without any unduly sharp bends, which would provide an admirable course. He does not propose that fast riding or driving should be permitted at a time when it would annoy other users of the parks, but between the hours of five and six or seven in the morning the very few people who find their way into these pleasantries would probably be rather pleased than otherwise if a little excitement was thus gratuitously provided for them. In America it is a recognised thing in the parks and in the vicinity of many of the large towns for owners of fast trotting horses to speed them at certain hours, and it provides an interesting spectacle. The extension of the idea to this country could be easily managed—but for the prejudice of people in authority.

The Exhibition.

ON April 19th the doors of the Agricultural Hall, Islington, will open upon an exhibition of motor-vehicles that will be the most representative display ever seen outside France. In fact, in many respects the forthcoming display will vie with that held in Paris recently. Not only is all the ground space of the Hall booked, but the Minor Hall will contain a fine collection of vehicles for heavy traffic. In the gallery will be a splendid show of cars, parts, accessories, etc., while the display of motor-garments will give new interest to the Exhibition. More than two hundred firms will be represented, and new inquiries for exhibiting space are coming forward every day.

Round the World.

SPECIAL interest at the forthcoming Exhibition will be centred in the 30-h.p. Panhard car with body-work by La Carrosserie Industrielle, of Paris, which will be on view during the first three days of the Show. This will be one of the finest examples of French automobile manufacture ever seen in this country, and the curiosity of the public will be further aroused when it is generally known that this particular vehicle will be driven by Dr. Lehmann in his tour round the world. This projected journey has already been the subject of much comment in the Press, and the fact that it will commence from the Agricultural Hall on Wednesday, April 23rd, should serve to attract a large attendance on that day.

The Law of the Inn.

ONE day this week a London journal published an article on "the regeneration of the inn; how automobilists may help," in which it was urged that motoring would do much to restore the prosperity of our country hostels. In another column was the report of a case in which some travellers, who had journeyed through Surrey by motor-car, appealed from a County Court decision, and raised an important point as to the obligations of innkeepers under the common law to provide shelter to travellers on demand. The defendant was the landlord of the Chequers, Horley, who refused to accommodate the travellers on being roused from his slumbers at two o'clock in the morning. The motor-car had broken down, and they tramped through the

rain to the Chequers, where the landlord declined to entertain them. They sallied forth, hired a brougham, and drove home to Crawley, one of the travellers contracting rheumatism as the result of the adventure. He endeavoured to obtain compensation, but failed, the County Court judge giving a verdict for the landlord. The appeal has been dismissed, the Lord Chief Justice explaining that the rule as to common law was that an innkeeper must provide accommodation for people who came to him as travellers, and who were in a position to pay him; but he could not think the authorities went to show that where an innkeeper provided a certain number of beds and a certain number of sitting-rooms, and received guests who occupied the former and had the use of the latter, he was under a legal obligation to receive and shelter as many people as came to his house as the rooms would hold without overcrowding. He did not think there was a legal right, apart from the circumstances of the case, on the part of a traveller to be allowed to pass the night in a public sitting-room.

Motor Omnibuses.

NOT only have the London papers again declared that the motor-omnibus is coming, but the scheme for a motor-omnibus service for suburban traffic in Birmingham is maturing, and early in May an experimental service will be started between Harborne and Hagley Road, Birmingham. The sanction of the Watch Committee has already been obtained, and the necessary capital is being privately subscribed. The new vehicle, which will be of Birmingham manufacture, will be capable of seating sixteen passengers inside and six out, with seats for the driver and conductor. The engine is of 20 h.p., and is water-cooled. It is so arranged that the exhaust from it may be optionally used for heating the interior of the vehicle in cold seasons. The omnibus will be fitted with an adjustable cover, which may be removed in fine summer weather. Solid rubber tyres will be provided, and the omnibus, which will have a total weight when fully loaded of about three and a half tons, is designed to travel at twelve miles an hour, but the average speed will probably not be more than eight miles.

In the Air.

M. SANTOS DUMONT has been examining the grounds of the Crystal Palace with a view to ascents therefrom during the present year. The organisation in connection with these will be in the hands of the Aero Club, through which Mr. C. A. Pearson has offered a prize of £4,000 to be given to the successful aeronaut who makes a trip in the air from one given point to another. It is reported that this journey is to be from London to Birmingham, but such a distance is an absurd length for an airship as yet in an experimental stage, and some such distance as from the Crystal Palace to Ranelagh is more likely to be ultimately selected. According to the Hon. C. S. Rolls, there are more than a hundred people at work in this country on the construction of navigable balloons and airships, and should the competition take place, as it is likely to, in June, it will be one of the features of a busy year.

The Aeronautical Institute.

ON Friday, the 7th inst., a meeting of the Aeronautical Institute and Club was held at St. Bride's Institute, London, when a paper was read by M. Auguste E. Gaudron dealing with the progressive improvements in the navigable balloon from its inception in 1852 to the present time. Giving credit for the first practical design to Henri Giffard, who made his experiments in 1852, the lecturer dealt in detail with the demonstrations of Dupuy de Lôme in 1870, Gabriel Yon in 1880, the Brothers Tissandier in 1881 (who introduced electricity as a motor power for balloons), and with the successful ascents made by Messrs. Renard and Krebs in 1884. M. Gaudron did not express himself favourably in regard to the attempts of Herr Schwarz in 1898 to

produce a metallic balloon, declaring that all such designs were doomed to failure owing to the liability to fracture upon coming to earth. For a similar reason he discounted the merits of the Zeppelin airship of 1900, where stiffening was attempted by means of a lattice framework of aluminium. In conclusion, the lecturer instanced the demonstration at the Alexandra Palace in 1898, as the only occasion when a navigable balloon has been experimented with in public in this country. M. Gaudron was in charge, but the day was windy, and the motor not working well, consequently the results were not all that could be desired.

Motor-Cars and Agriculture.

Mr. HANBURY, the Minister for Agriculture, was very emphatic in his advocacy of motor-cars to the members of the Yorkshire Agricultural Union on Saturday. He said he hoped to see such vehicles competing with the railways for the conveyance of goods to villages. To secure such a desirable result he said they would have to be allowed to travel at a reasonable pace, and that the roads of the country would have to be put into a better state than they were at present. Everyone who knows anything of agriculture is coming to the conclusion that the automobile will be a friend to the farmer, and that its adoption will do much to revive the prosperity of those associated with the soil. We hope Mr. Hanbury will make his views known to his colleagues in the Government.

A Trans-American Trip.

THE Winton Motor Carriage Company, of Cleveland, have lately sent us a little booklet describing the attempt made in May last by Messrs. A. Winton and C. B. Shanks to make the trip in a motor-car from San Francisco to New York. As we reported at the time, the attempt ended in failure, but after reading the account of the roads met with, one can hardly be surprised at the result. Though no one can question the amount of grit possessed by Mr. Alexander Winton, yet too much grit and too much sand, when they comprise all there is of an alleged American road, are too much even for the most ardent motorist, hence the abandonment of the enterprise. After several days' difficult work the car stalled in a sand hillock near Winnemucca, Nevada, and could not proceed. The two automobilists took the train for Cleveland, and the vehicle was despatched by goods train as soon as it could be dragged out. Elsewhere, on page 24, we reproduce some interesting photographs which will give an idea of the difficulties encountered. Mr. Winton is said to be in no wise convinced that he cannot make the Trans-American trip, and will, it is reported, attempt it again with a vehicle specially built to combat the peculiar conditions which confront a motor-car in a run across the American Continent.

Helping the Public.

At the annual meeting of the Automobile Club, Mr. G. Cornwallis-West raised a question as to the competency of repairers of motor-vehicles and the varying charges for similar repairs in different towns. We confess to some sympathy with him in his complaint on the latter score, but there are many difficulties in the "standardisation of prices" in connection with a young industry to which mechanics are not yet accustomed. Associated with this question is the way in which those who have vehicles for sale treat their customers. The seller must put himself in the position of a physician who prescribes for a patient after a thorough diagnosis of the symptoms. The mechanical aptitude of the purchaser, the nature of the roads over which the machine is to be used, character of the service, care to be given the machine, etc.—all of these points must be fully considered, and if, after duly weighing them all and advising accordingly, the seller finds his customer recalcitrant and determined to have what he wants rather than what will give him satisfaction, then the prudent course is to decline to sell. It is better to lose a few undesirable

customers than to lose one's reputation, for this constitutes the future probability of profit in a business, and many in the trade have lost it by adopting this narrow and short-sighted policy of giving people what they desire regardless of consequences. It is not always wise to give the public what it wants.

Vehicles for Heavy Traffic.

GREAT is the interest now being taken in motor-vehicles for heavy traffic, and most of the firms engaged in such work are busily employed. In fact, the demand is greater than the supply, and the future of this particular branch of the industry is well assured. Several leading contractors are waiting till the exhibition at the Agricultural Hall ere placing their orders, and there is no doubt that both for passengers and for goods traffic there is a busy time in prospect for the makers of large vehicles. They have waited long, but the harvest should be a good one, amply compensating for previous disappointments. We understand that the new Manchester to Liverpool motor mail-van service, which was to have been inaugurated on the 1st inst., has been delayed owing to the prevailing activity in the industry. Messrs. G. F. Milnes and Co. are supplying the vans to be used in the work, and it is hoped to have the service in operation at the end of the month.

THE HON. C. S. ROLLS AND MR. MARK MAYHEW ON THE FORMER'S 20-H.P. PANHARD.

The Easter A.C. Tour.

THE headquarters of the Automobile Club during Easter will be the Royal Links Hotel, at Cromer, and there the members will meet on the night of Good Friday. On the Saturday speed trials will probably be arranged on Lord Suffolk's private road. There are three roads to Cromer from London, and of these Messrs. Hargreaves and Edge recommend the following:—

	Miles.
Finchley Road Station and Whetstone to	
Barnet	13½
Hatfield via Potter's Bar	9
To Baldock	12
Baldock to Royston to Great Chesterford ..	21
Great Chesterford to Newmarket	16½
To Thetford	19
„ Norwich	29
„ Cromer	23½
	143½

On this particular road there is a stretch of about twenty miles with scarcely a cottage on it. The alternative routes are via

Epping and Colchester, or *via* Bishop Stortford and Saffron Walden.

A Little Flutter.

A PARAGRAPH or two in one of the London halfpenny journals has caused quite a flutter of excitement in the trade, and we have received several letters from well-known gentlemen denouncing the style of business that seeks to obtain fancy prices for automobiles. British makers point out that premiums are not obtained on their cars with their sanction, and they regret the appearance of the paragraph, which is calculated to do harm to the motor-car industry by delaying the placing of orders, and also by encouraging financial speculators and promoters to enter the trade. These, without technical knowledge, are not likely to add to the credit of the business. Whilst we agree with our correspondents to a very large degree, we would remind them that although such statements may be widely circulated, they are not likely to influence intending buyers of cars, who are content to rely on the automobile journals and the opinions of motoring friends for advice.

A Portsmouth Automobile Club.

A MEETING of Portsmouth motorists was held in the Mayor's Parlour, at the Portsmouth Town Hall, on Friday, the 7th inst., under the presidency of the Mayor (Major W. T. Duprée), for the purpose of electing the officers of the newly-established club. Mr. Sapp (secretary, *pro tem.*) having read letters of apology for non-attendance from the local Parliamentary representatives, Mr. Vernon Inkpen pointed out the many advantages of a combination of automobilists in the town. Major Duprée was unanimously chosen president. Mr. J. H. A. Majendie, M.P., Mr. R. J. Lucas, M.P., Ald. Jenkins, and Mr. Vernon Inkpen were elected vice-presidents, whilst Messrs. J. F. White and Ernest Sapp were appointed treasurer and secretary, respectively. The Committee was elected as follows:—Dr. Knight, Major Dawson, Messrs. Sherwell, Cox, Barnes, Hine, Rose, Glasier. Dr. Claremont and Mr. Clover were appointed honorary auditors. The historic George Hotel, Portsmouth, was decided upon as the headquarters of the Club.

Photographs Wanted.

Now that the severity of the winter season is over, motorists are going forth into the highways and byeways. Week-end trips are already beginning, and we would repeat the invitation we have given in previous years to readers to favour us with interesting snapshots of motor-vehicles taken amid scenes of country beauty, or in localities of historical associations.

Motor-Cycling in Dublin.

THAT motor-cycling has secured a position among the sports of the Irish capital receives confirmation in the formation of a motor-cycle club in Dublin. This was decided upon at a meeting held in the Hotel Metropole, Dublin, on Friday, the 7th inst. There was a large attendance, Mr. J. B. Dunlop presiding. The chairman pointed out the advantages to be derived from such a club, and also touched upon carburettors, the position of the engine, side-slip, and other matters of technical interest. Subsequently, Mr. Dunlop was elected president of the club—which was given the name of the Dublin Motor Cycling Club. Mr. R. J. Mccredy was elected captain, Mr. J. C. Percy, hon. secretary, and Mr. F. A. Wallen, treasurer. A further meeting will be held on Friday next, when the committee will be elected and rules approved for the future conduct of the organisation, upon the excellent promise of which, Mr. Percy, as the convener of the initial gathering, deserves the hearty thanks of Irish motorcyclists.

Professor Hele-Shaw's Paper.

DOUBTLESS the technical character of the title of Professor Hele-Shaw's paper at the Automobile Club on Wednesday was partially responsible for the somewhat meagre attendance of members. The subject of "Roller Bearings" is an important one, but does not ordinarily lend itself to after-dinner treatment. Professor Hele-Shaw, however, had gone to much trouble and expense to give actuality to his lecture, and, by means of specially prepared models, diagrams, and experiments shown by the aid of the lantern, was able to delight and instruct his audience in a way that made the evening unique in the annals of Club discussions. Mr. Worby Beaumont was in the chair, and after the paper a very interesting discussion took place, those participating therein including Messrs. Lyon Sampson, Tinne, Bird, Mays, Shrapnell Smith, and Kitto.

Roller Bearings.

PROFESSOR HELE-SHAW pointed out that whether they considered the question of starting from rest, or of easy running when in actual motion or of uniformity of action, the roller bearing presented great advantages for motor-cars. Seven great difficulties however, presented themselves, these being as follows:—(1) The concentration of load at a point. (2) The expense and difficulties of obtaining rollers truly circular and cylindrical. (3) The rubbing of the surfaces of the rollers themselves. (4) The difficulty of adjustment. (5) Twisting or the want of parallelism of the rollers relatively to each other when slightly worn. (6) The difficulty of providing for end action or side pressures. (7) Hammer blow and shocks with motor-cars, when wearing has occurred. After dealing with some of the bearings now on the market, reference was made to an ingenious device by Mr. Brennan, in which the cage for roller bearings is made from an alloy, having a melting point at a temperature less than that which would destroy the hardness or temper of the rollers contained therein, which in this case takes the form of balls. Professor Hele-Shaw elaborated a mode of adjustment by the adoption of cones, instead of cylindrical rollers, and concluded by a suggestion that a committee of the Club should be formed, to hold a series of experiments on types of roller bearings for motor-cars.

The Scottish Automobile Club.

At the meeting of the Western Section of the Scottish Automobile Club last week, the chairman, Mr. J. R. Nisbet, asked the views of the members on the proposed "non-stop" run to London. The general opinion was that absolute non-stop over such a distance, though quite possible, was not desirable, nor would it carry any weight with the public mind; the public would be quite satisfied to know that motor-vehicles could run given distances between meals and sleeping hours. It is probable, therefore, that the Committee will run the trial over either two or four non-stop sections. At the next meeting, on the 25th inst., Mr. Napier will read a paper on "Motor Troubles."

AN enthusiastic New York motorist writes that there is no one spot in that beautiful region skirted by the Hudson River that has been so richly endowed by Nature, or been as thoroughly and intelligently developed by man, as Ardsley-on-Hudson. Considered from every point of view, it is an ideal retreat for those who can command the best, or those who, retiring from the rush of modern civilisation, have time to enjoy life among thoroughly attractive surroundings. To Ardsley is a run out from New York of about twenty-five miles over very good roads, and during the summer months it is well patronised by automobilists. In view of this, the Locomobile Company of America, with their usual enterprise have lately established an automobile station at Ardsley. On another page of the present issue we give an illustration of the station where storage accommodation and facilities for re-charging and repairs are afforded, not only for steam-cars, but also for petrol and electric vehicles.

THE BRUSSELS MOTOR-CAR SHOW.

AN automobile exhibition was opened by Prince Albert of Belgium in the Palais du Cinquantenaire, Brussels, on Saturday last, and will close on Monday next. It has been organised by La Chambre Syndicale de l'Automobile, under the auspices of the Belgian Automobile Club. The show is very interesting, there being altogether 133 exhibitors. It has been well patronised by French firms. Of French-built cars we noticed specimens of the Panhard, Mors, De Dietrich, Delahaye, Hurtu, De Dion, Renault, Darracq, and Clement. Germany is represented by the Cudell and Scheibler vehicles, while Holland has an exhibitor in Messrs. Spyker Brothers, of Amsterdam, who show the Trompenburg cars, which are shortly to be brought before the notice of the English motoring world. Belgian-built automobiles are, of course, well to the front, these including the Linon, Gobron-Nagant, Vincke, Vivinus, Dechamps, Delin, F.N., Pieper, Pipe, Germain, and Belgica cars, which are already fairly well known. Messrs. Longtin and Le Hardy De Beaulieu, of Jette-Saint-Pierre, exhibit a 10 h.p. light car, which, while

THE BRUSH LIGHT CAR.

REFERENCE has already been made in the *Journal* to the light car which is being put on the market by the Brush Electrical Engineering Company, Limited. We are now able to publish an illustration of the vehicle, together with a brief description. The motive power is supplied by a vertical two-cylinder petrol motor, developing 10 b.h.p. at a normal speed of 800 revolutions per minute. As a description of the engine was published in our issue of January 25th last, it need only be here mentioned that it is fitted with a centrifugal governor acting on the admission pipe, provision being also made to control the throttle valve from the driver's seat. Either electric, magneto-electric, or tube ignition can be fitted. The water-circulation for the cooling of the cylinders is maintained by pump and radiators, the former being of the centrifugal gear-driven type, the gear being enclosed in the crank chamber. Three speeds forward and a reverse motion, controlled by a single lever at the side, are provided. The engine transmits its power through a pedal-controlled friction clutch to the change-gear box, and thence by bevel gear to a cross

THE BRUSH LIGHT CAR.

following the general lines of the Panhard, comprises several novel features. The four-cylinder engine is fitted with a regulator acting on the admission, while the water-circulating pump is mounted directly on the engine-shaft. A special form of spring clutch is employed between the motor and the change-gear box, for which it is claimed that there is no thrust strain on the shaft, and that oil does not detrimentally affect its action. M. J. Lefert, of Ghent, and M. O. De Ruyter Demessine, of Brussels, both show electrical vehicles, while steam cars are exhibited by the agents for the Locomobile and Messrs. J. Miesse and Co., of Brussels. In general appearance the latter closely resembles a petrol vehicle. It comprises a number of special features, and we hope to illustrate and describe it in an early issue, especially as we learn that arrangements have just been completed for its introduction on the English market. No English cars were to be seen, but among the motor-cycles, of which there is a big display, we noticed specimens of the Singer machines.

AN automobile exhibition is being organised at the Hague, Holland. It is to be opened on the 30th inst.

THE American Darracq Company has been formed in New York to import Darracq cars into the United States.

differential shaft, the usual duplicate pair of chains and chain-wheels connecting this with the rear road-wheels. Non-reversible inclined wheel steering is adopted, while both hand and foot brakes are available, each acting equally well, be the car travelling in a forward or backward direction. The frame—of wood and steel—is supported by long springs on artillery wheels of equal size (32in. diameter), these being shod with 3½in. pneumatic tyres. The weight of the chassis comes out at 10½ cwt., while the tonneau illustrated complete, with petrol, water, tools, etc., ready for a run, weighs 15 cwt. The vehicle, which can attain a speed of thirty miles per hour, is the outcome of much study on the part of its builders, who have just opened large show-rooms at 66, Great Russell Street, London, W.C.

ON Monday a meeting was held at Northiam to consider the advisability of starting a service of motor-cars between Northiam and Rye and the former place and Hastings. It was decided to form a company for the purpose, and £2,000 was mentioned as the probable amount of capital which would be required at the outset.

AN ACCUMULATOR CHARGING BOARD.

IN connection with the article on the "Use and Care of Accumulators," which appeared in our last issue, the General Electric Battery Manufacturing Company, of 461, Coldharbour Lane, Brixton, S.W., have brought to our notice a useful little charging board they have just introduced, enabling those motorists and agents who have a supply of electrical energy (continuous current) available to charge ignition accumulators on their own premises. From the accompanying illustration of the device it will be seen that it comprises a board which can be fastened to a wall or table near any convenient electric lamp in the house or dépôt. A is an adapter which connects the board with the source of electrical energy, it being made so as to fit into an ordinary lamp socket. B are holders for two incandescent lamps, by which the necessary resistance is obtained. Flexible wires extend from one end of the board for connection with the accumulator C, which requires recharging. The board can be used in connection with any ordinary continuous-

current mains (100 volts or 220 volts). To charge small accumulators up to seven ampère-hour-capacity on a 100-volt circuit one 16 c.p. incandescent lamp is sufficient; for larger capacities two lamps are necessary. On circuits of over 100 volts 32 c.p. lamps must be used in place of those of 16 c.p. The lamp or lamps are made to act as switches as well as resistances. The adapter is first put in place and then the wires are connected up to the accumulator, no current passing until the lamp is put into place. By means of the arrangement small batteries can be recharged in about six hours. The charging board is neatly made and provided with long lengths of well insulated flexible connecting wires, and in view of the low price at which it is being put on the market it should meet with a large sale. The General Electric Battery Company have also sent us samples of a useful clip for attaching ignition wires to terminals in such a way that there is no danger of the connections becoming loose owing to vibration or jolting.

THE motor bus service in Manor Road and Queen Street, Scarborough, has been suspended for a few days so that the cars may be thoroughly overhauled before the busy season.

A COLOMBO firm has ordered two motor-cars to be used in the Southern Province of Ceylon for the conveyance of passengers and goods.

ACCORDING to a policeman giving evidence against a motorist at the King's Heath police-court, "the frost had frozen the carbon," with the result that the speed of the car was accelerated.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE Gordon-Bennett cup race is still enveloped in the mists of uncertainty. When, where, or whether the contest will be held is as yet undecided, on account of the attitude of the Government, who still show no signs of relenting in their attitude towards any automobile races on the French roads, always excepting the alcohol race which is being organised by the Minister of Agriculture. In the meantime, M. Journu has been spending the last two months in an endeavour to obtain the Ministerial sanction to a Paris-Bordeaux contest, in which alcohol will be the carburant. M. Journu has personally visited the nine departments and 158 mayors of the communes through which the road from Paris to Bordeaux runs. All the mayors, without exception, have signed a petition to the Government calling on it to authorise the race. Innumerable signatures of officials and notabilities in the various districts have also been obtained, and deputies by the score are adding their names to the list. The petition points out that the automobile industry has brought prosperity to many branches of trade and manufacture in the provinces, and found work for 100,000 workmen. "That this industry will bring further benefits owing to the efforts of the A.C.F. in substituting alcohol, which is a national product, for petrol, which is imported, which substitution will result in bringing into the hands of the French farmer millions of francs which formerly went into the hands of foreigners. That an automobile race exclusively for cars driven by alcohol, thanks to the publicity which would result from it, is the best means to generalise the use of this product, and to show that it can advantageously replace petrol." These are two clauses from the petition.

M. JOURNU has explained to me the following very strong reasons in favour of the Paris-Bordeaux race. In the first place, the course is already well known to *chauffeurs*, and from the nature of the roads high speeds are attainable, whereas the course already chosen for the Ministerial race is over roads which are not so good, and where certainly the average speed will be lower. Should, however, the average speed in the Ministerial race not equal the average speed of last year's Paris-Bordeaux, the public will certainly say that it is because alcohol has been used. On the other hand, as it is pretty certain that this year's speed on the Paris-Bordeaux course will outdo last year's, an alcohol race would bring home to the public the qualities of alcohol, and make the demand increase in considerable proportions.

It is probable that the efforts of M. Journu will be crowned with success, and then the Gordon-Bennett cup race might be held over the now classic course, but for one difficulty—would the A.C.G.B.I. agree to run with alcohol instead of petrol? The French competitors would raise no objection, having already studied the question, and knowing that it will make no difference to their speed. Opinions on this point are divided amongst authorities of the A.C.F., and some fear that the English competitors, not understanding the gravity of the situation, may raise objections, as they have no interest in alcohol *versus* petrol, and no experience of the results. On the other hand, the French authorities would, I feel sure, gladly put all their experience at the disposal of English competitors to bring about the desideratum.

ON Wednesday last week the *Auto-Velo* held a sequel to the "Criterium of Consumption," which consisted in a second competition amongst the winners, called the "Winners' Pool." In the original competition there had been such extraordinary results that there was prevalent in the minds of many people a doubt as to whether time had been available for a serious measurement in verification of the results. It was therefore decided to ask the winners to run the course over again, and special pains were taken with regard to the exactitude of the figures. The results

have proved even more astonishing than those of the original competition. I give them below :—

Firm.	h.p.	Total weight with passengers.	Fuel consumed.	Consumption in litres per kilometric ton.	Classification per kilometric ton.
I. Voiturettes.					
Peugeot ...	5½	550	4 litres 800	0.0889	1
Peugeot ...	5½	550	4 „ 900	0.08909	2
Georges Richard	3	510	5 „ 580	0.109	3
II. Light Cars.					
Darracq ...	6½	750	4 litres 850	0.0646	1
Georges Richard	5½	600	4 „ 985	0.0830	4
Korn ...	6	733	5 „ 500	0.0750	3
De Dion ...	6	865	6 „ 330	0.0731	2
Gladiator ...	6	760	6 „ 998	0.0920	6
Peugeot ...	8	1030	8 „ 890	0.0838	5
III. Cars up to 1 ton.					
Chenard and Walcker	12	1,070	5 litres 500	0.0514	1
Bardon ...	5	918	6 „ 470	0.0704	2
IV. Heavy Cars.					
Georges Richard	8	1,240	10 „	0.0806	1
Delahaye ...	7½	1,240	10 „ 650	0.0858	3
Delahaye ...	12	2,060	15 „ 130	0.0734	2
V. Heavy Traction Cars.					
Gillet-Forrest ...	10	1,833	13 litres 290	—	2
De Dietrich ...	12	2,890	12 „ 900	—	1

The general classification in kilometric tons is as follows :—

1. Chenard and Walcker ... Car under ton.
2. Darracq ... Light car.
3. Bardon ... Car under ton.
4. De Dion-Bouton ... Light car.
5. Delahaye ... Heavy car.
6. De Dietrich ... Heavy traction vehicle.
7. Korn ... Light car.
8. Georges Richard ... Heavy car.
9. Georges Richard ... Car under ton.
10. Peugeot ... Light car.
11. Delahaye ... Heavy car.
12. Peugeot ... Voiturette.
13. Peugeot ... Voiturette.
14. Gladiator ... Light car.
15. Georges Richard ... Voiturette.
16. Gillet-Forrest ... Heavy traction car.

These results give plenty of food for reflection, and open a new field to the emulation of the different manufacturers. The competition has proved itself to be of the greatest utility, and it is to be concluded that it will become an annual event of importance, and that it will gradually reduce to a science the economical use of fuel. The entirely new and unknown car of Chenard and Walcker has again scored a pre-eminent success.

OWING to the difference of opinion and divergence of views which were expressed at the meeting of the A.C.F. some few weeks ago, when a general meeting was held for the purpose of creating an association affiliated to the A.C.F., but with a very small subscription in order to bring into touch the great masses of the humbler automobilists and enable them to contribute towards the encouragement and the propagation of the industry, the subject has been officially dropped for the time being by the A.C.F. On the other hand, there was founded last week the "French Automobile Association," which is to take up the position of the proposed association. Amongst the founders are to be seen the names of nearly all the chief founders of the A.C.F. The subscription is to be as follows: 20 francs for ordinary members, 15 francs for members of the Touring Club of France, and 5 francs for the members of the A.C.F. The wise decision has been come to to make the headquarters in the Avenue de la Grande Armée, for it is there that the greatest number of *chauffeurs* and *mecaniciens* are to be found, and the new society will constitute a popular meeting place for petrol talk.

THE WESTFIELD MOTOR-BICYCLE.

MR. WESTFIELD, of the Rising Sun Cycle and Motor-Works, 330, Brockley Road, Crofton Park, S.E., has sent us a photograph, reproduced herewith, of a motor-bicycle he has lately put on the market, and which comprises a number of special features. The frame of the machine is of strong construction and is somewhat longer than usual, to admit of the 1½ h.p. Kelecom air-cooled motor being supported in a vertical position behind the main down tube. A modified form of Longue-mare carburettor is employed to furnish the explosive mixture. Electrical ignition is employed, its reliability being increased by the employment of a positive form of make and brake contact. The main frame of the machine is filled up by a metal case divided into compartments, that for petrol having a capacity sufficient for 100 miles, and that for lubricating oil 200 miles. The accumulators, induction coil, spare parts, etc., are also carried in this case. All wiring about the frame, and the handle-bar switch has been dispensed with, there being only 4 in. of high-tension wire and 6 in. of low-tension wire outside the case. The machine is started and stopped by a small lever on the handle-bar,

which, by means of a Bowden wire, actuates a combined switch and exhaust-valve lifter. Ample brake power is provided, there being a combined free-wheel and back-peddalling brake in the rear wheel hub, and a rim-brake on the front wheel. The power of the engine is transmitted by a belt to a light metal pulley on the hind wheel, the motor being started by the usual pedals and chain gear. We are informed that the machine can attain a speed of 30 miles per hour on the level and ascend all but the steepest hills without assistance.

It is likely that some trials of electrical vehicles will be held shortly after the Coronation, the programme including a series of daily runs from London to Brighton, Ascot, Windsor, Sandown, and other places in the vicinity of the Metropolis.

MR. WALTER CREBER, of Barhead, N.B., has received the Automobile Club's medal gained by his Albion car during the Glasgow trials. It is the only medal gained by a Scottish-built car. Mr. Creber has also received the Club's driving certificate in connection with the same trials.

A NEW motor coat in Irish frieze, and rendered rain proof by a special quicksilver process, has been introduced by Messrs. H. J. Nicoll and Co., of 114, Regent Street, W. The coat is lined with soft leather which is pliable to the movements of the body, and fur wind-traps are inserted into the ends of the sleeves.

MESSRS. JOHN CHILD MEREDITH, LIMITED, have just introduced a slight modification in the carburettor for bicycle-motors lately illustrated in these columns, they having found by experiments that by allowing for a greater volume of air to be admitted the power of the motor is considerably increased. The carburettor is now being provided with an additional air inlet underneath the petrol control valve, the lever on top of the device being dispensed with.

Mechanical Flight Up-to-Date.*

By SIDNEY H. HOLLANDS.

CHAPTER V.—continued.

THE reader may now turn to the illustrations of two of Mr. Hargrave's early compressed air motors and pressure reservoirs for winged (flapping) models. It will be noticed that both of these motors are mounted on, and embodied with, their respective cylindrical pressure reservoirs. In one case (Figs. 3 and 4) a novel form of oscillating cylinder arrangement is used, actuating the wing-arms by means of a three-throw crank-shaft and suitable double-jointed connecting-rods, the cylinder having a detached piston valve, worked off an eccentric. This latter design is an ingenious means of ensuring a positive motion of the wings and of the pressure-distributing valve. By the way, in these little high-pressure motors one learns early the necessity of using some form of balanced-pressure distributing valve. Mr. Hargrave adopted the piston valve in his later models. I used

The large Maxim steam motor (Fig. 7) is now so generally familiar that it is really almost superfluous to describe or illustrate it. It is unquestionably the lightest large motor ever made for its power. It may not, perhaps, be so generally known that these twin engines were of two-cylinder-compound type, with cranks at 180 degs., and with a quite original self-adjusting connecting-rod head. In short, there were so many original "dodges" among the accessories of this big machine that a separate chapter would be needed to describe them. The generator was provided with an efficient system of forced circulation, feed-heating, and gas-firing (vaporised gasoline), and worked at a pressure of 320 lbs. per square inch. It was fitted with a separate regulator for each of the twin motors. The following experiment—which I witnessed on the Maxim machine—will give an idea of the remarkable efficiency of the firing arrangements. On one of the trials of this machine, just before starting, the steam-pressure stood at

FIGS. 1 AND 2.—ELEVATION AND PLAN OF HARGRAVE'S ROTATIVE STEAM AERIAL MOTOR (1895).

another form, giving less leakage, after discarding three-ported unbalanced slide valves. The other of these two models of Mr. Hargrave's has a fixed cylinder within the pressure reservoir, with an ordinary three-ported slide worked off a small auxiliary crank-shaft, used for that purpose solely. The inner ends of the wing-arms are directly connected to the piston-rod head, and the fulcrums are on double-splayed rocking standards (see Figs. 5 and 6). The two latter little motors were among the earliest of Mr. Hargrave's compressed-air-driven models. The two next illustrated are designed for steam pressure, and have very light and efficient instantaneous coil generators. A cleverly-designed tappet-gear for actuating the piston valve is used with the non-rotative type for flapping flight. The other motor, driving a rotating propeller, is a neat little three-cylinder engine, with a rotating valve (Figs. 1 and 2). Particulars of weight, etc., of these will be found accompanying the illustrations.

175 lbs. per square inch. The steam was turned full on to the engines, both regulators open full bore, and the feed-pumps, of automatically variable stroke, put into full gear, pumping water into the generator at the rate of 5,000 lbs. weight per hour. In spite of these trying conditions, the steam-pressure rose from 175 lbs. to 275 lbs. in about one minute, the gas-furnace being turned full on. The ratio of weight of motor for power actually developed in this machine was about six pounds per effective horse-power. At the present time all other than steam, petrol, or spirit motors may be said to be excluded from the field of aeronautics. Electrical power—which some still pin their faith to for this purpose—is immensely too heavy.

Reverting now to explosion or internal combustion motors, which, for present practical purposes, we may narrow down to

* All rights reserved.

the petrol motor, motors of this class are necessarily rotative and of high speed. Certain types of aviator demand a *non-rotative* reciprocating motor of comparatively low speed; and, as the introduction of intermediate additional mechanism to translate the motion from rotative to reciprocating is inadmissible in this application, the petrol motor is again at a disadvantage compared with the steam engine, which may be of either type with equal facility. In short, the petrol or spirit motor is only adaptable to the driving of rotating propellers. Santos Dumont, although he adopted the petrol motor for his inflated "airship," once made the remark that "motors of this class resemble the fair sex in

FIGS. 3 AND 4.—HARGRAVE'S COMPRESSED-AIR AERIAL MOTOR (1885).

being very capricious." Now, although we must naturally expect, and gracefully submit to, a certain amount of this commodity in an otherwise charming woman, we fortunately are not restricted to a motor that displays a quality so out of keeping with the imperative demands of safe aerial navigation.

The lightest petrol motor yet produced was, I think, without doubt, the Kane-Pennington—even after largely discounting the original claims—having cylinders of thin-drawn steel tube, etc. The earliest forms of this motor, which were the lightest, had

FIGS. 5 AND 6.—HARGRAVE'S COMPRESSED-AIR AERIAL MOTOR (1885).

however, two particularly bad features: in the first place, they were not provided with any efficient means of cooling, neither radiating flanges nor water-jacket; and in the next place, they had not an enclosed crank-chamber. Consequently this motor could not run continuously. Later, when it was found necessary to apply water-cooling, the weight was thereby, of course, considerably augmented. It appears to me, however, that thin steel tube, surrounded with a much thinner outer tube enclosing a narrow water-jacket (provided with very efficient circulation), in combination with a thin steel enclosed crank-chamber (not necessarily a casting, but if a casting, an alloy of aluminium and magnesium preferable), due provision being made to take the thrust on the crank-shaft, which latter member would, of course, be hollow, with redundant metal cut away from the cranks; it appears, I say, that this modified construction might be adopted

with advantage as a substitute for the prevailing construction and materials in aiming at the lightest practicable petrol motor for aeronautical use.

The lightest produced recently (of the latter), and now placed on the market, is that of Messrs. De Dion-Bouton a (special), 40-h.p. four-cylinder water-cooled motor, weighing 400 lbs., or 10 lbs. per h.p. This is a considerable advance in lightness on Santos Dumont's 20 h.p. Buchet motor, and a great advance on

FIG. 7.—HORIZONTAL SECTION OF MAXIM ENGINE.
Normal Working-pressure, 280 lbs. per square inch; Speed, 350 revolutions per minute.

the 35-h.p. Mercedes used by Herr W. Kress, of Vienna, on his experimental aviator, as this motor weighs no less than 700 lbs., or 20 lbs. per h.p. We may take it that the lightest petrol motor at present available weighs 10 lbs. per h.p. The lightest steam motor now producible is about 7 lbs. per h.p., including water for an equal duration of power. Now the steam engine is certainly not "capricious," and, as we see on comparison of the foregoing figures, has a 30 per cent. higher power ratio, besides its adaptability to non-rotative types.

MR. ROLAND BROWNE has opened offices at 13, Regent Street, S.W., in connection with the Lanchester Engine Company, Limited.

A MOTOR-BICYCLE race is included in the list of events to be run off by the Putney Athletic Club on the Putney track, on Easter Monday.

THE shed built in the grounds of the Aero Club at St. Cloud, near Paris, for the accommodation of M. Santos Dumont's airship, has been sold for £40. It is to be taken to pieces and re-erected in the outskirts of Paris for use as a motor-car garage.

WRITING with regard to the remarks of Mr. Letts, as to gasoline cars in the United States, in our issue of the 1st inst., a correspondent points out how they go to confirm what Mr. C. Jarrott said in an interview which appeared in the *Journal* on April 20th, 1900, to the effect that the "prospects of gasoline in connection with motor-cars are decidedly improving, and many of the United States manufacturers are turning their attention in that direction."

DURING the coming summer Mr. H. J. Wimshurst, of Coventry, the travelling agent for the Progress Motor Company, proposes to carry out a series of tours on a Progress car. His first journey will commence on the 27th inst., and will be by way of Lichfield, Stone, Knutsford, Warrington, Liverpool, Wigan, Preston, Lancaster, Kendal, Windermere, Keswick, Penrith, Carlisle, Newcastle, and Sunderland, returning to Coventry via Middlesbrough, Scarborough, York, Harrogate, Doncaster, Nottingham, and Leicester.

THE Miesse Steam-motor Syndicate, Limited, has been registered with a capital of £50,000 to acquire the benefit of an agreement between Jules Miesse, of Brussels, of the one part, and the British Steam Traction Syndicate, Limited, of the other part, and the sole agency for the United Kingdom and British colonies for the sale of steam generators made in accordance with English Patent No. 4,855 of 1900, and all motors, motor-carriages, and vehicles made by the said Jules Miesse or furnished with the said steam generators; to adopt an agreement with Mr. V. C. Doubleday, and to carry on the business of motor, motor-car, and vehicle manufacturers, etc.

HERE AND THERE.

At Cannes, Nice, and Homburg those interested in the social season are in a flutter of excitement over the likelihood of visits from King Edward VII. Hotels and garages at these three resorts are being overhauled in view of the possibility of Royal patronage, and excitement has been increased by the report that one of the King's motor-cars has been sent to Cannes. During his last three visits to the Continent His Majesty has shown great interest in motor-cars, and the Homburg season of last year was made memorable by the trips which the King took on a steam car.

LAST week the Cheshire Hunt had a meet at Whatcroft, the gathering being the largest and most aristocratic of the present season. To automobilists it was specially interesting, as the Duke of Westminster took some friends from Chester on his motor-car, and the Earl of Shrewsbury also ran out to the hunt on his automobile. Evidently the protest of some masters of the hunt against the use of motor-vehicles in connection with hunting meets has fallen flat, and followers of the hounds rightly recognise that there is no loss of dignity in being up-to-date.

THE Earl of Craven attended Warwick Races on Saturday on board Mr. Oliver Stanton's Daimler carriage, "Le Chat Noir," which attracted so much attention on the occasion of the Southsea run. Lord Craven is an enthusiastic automobilist, and the Daimler Company are constructing a splendid 22-h.p. carriage specially for him.

AMONG military men who are in the habit of employing motor-cars when visiting their stations is Colonel Knox, J.P., the officer now in command of the Kilkenny Militia. While driving his car in the High Street, Kilkenny, the other day, one of the wheels of the vehicle came off and the Colonel was thrown with such force that he was rendered unconscious. Latest reports give the news that he is progressing favourably, which intimation will be welcome relief to his friends.

PHOTOGRAPHY adds a delight to motoring, not only in the country but also in the town. Ladies who are in the habit of motoring in Hyde Park, and who also delight in the pleasures and disappointments of amateur photography, should apply for the necessary permission to photograph in the park to Sir F. J. S. Hopwood, K.C.B., of the Board of Works, Whitehall, S.W.

TUNBRIDGE WELLS has been well identified with the automobile movement—thanks to the example and enthusiasm of Sir David Salomons. The Tunbridge Wells and District Motor Company is showing great activity and intend placing a new 20-h.p. car on the road without delay. This will be followed in a fortnight's time with an additional car. The motor is of the Benz type, and the vehicle will carry eighteen passengers. The company inaugurated its passenger service in July last year, and the venture has not only proved a boon to the public of the district, but is a success financially. A "garage" has recently been added to the company's premises, and repairs also undertaken. Mr. G. Allen is the general manager.

MOTORISTS in the Thames Valley will be glad to know that the agitation for the freeing of Maidenhead Bridge from toll continues. Unfortunately the Town Council seems rather loth to tackle the matter with anything like firmness. Dilatoriness was ever a characteristic of some local bodies.

THE Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, has been delighting Scottish automobilists, as he recently charmed the members of the parent club in London.

with incidents of early motoring days. In those incidents Mr. Koosens, of Southsea, figures prominently, the extracts given from the diary of Mrs. Koosens being most delightful reading. Mr. Koosens was present at the meeting of the new Club at Portsmouth last week, and said he had covered 75,000 miles on his motor-car without having had a smash—a fact which should induce the president of the club, Major and Mayor Dupree, not to delay his intention to become an automobilist.

TRAVELLING in an automobile the King and Queen of Italy recently went from Rome to Albano. When near Ariccia the vehicle ran into a ditch, but fortunately no one was hurt. A number of peasants came to the aid of their Majesties, righted the car, and the journey was continued.

MRS. CECIL POWNEY, a popular London hostess, was present with Major Cecil Powney at the opening ceremony in connection with the Imperial Motor and Cycle Repairing Works, Lyndhurst, on Saturday. Major Powney presided at the luncheon at Ye Olde Crown Hotel, and proposed success to the new venture, which toast having been enthusiastically drunk was responded to by Mr. Hamilton Dent, in the absence of Mr. Edward Morant, of Brockenhurst Park. Mr. Dent said they intended to do all they could for the development of automobilism in the New Forest district, and it was the intention to have several cars on hire for trips in that delightful region during the summer. The roads are in splendid condition and on Saturday about thirty-five motor-cars were within sight of the new works, some of which had been driven down from London.

BARON AMHERST OF HACKNEY and Sir C. E. Hamilton, Bart., have been elected to membership of the Automobile Club.

SINCE Mr. E. J. Coles appeared with his automobile on the stage of the Alhambra there has been no serious attempt made to amuse the public with a motor-car performance. Of course, motor-vehicles have appeared in pantomimes and in theatrical pieces, but they have been mere incidentals. It is rather strange that the motor-car has not been educated to undergo dramatic evolutions and fantastic gyrations. Something, however, is being done in that direction by a gentleman who was once connected with a well-known public service of motor-vehicles, and who hopes shortly to indulge in motor-car somersaults on the stage of a London music-hall. Special apparatus to give the necessary drop in which to perform the evolution is being prepared, and doubtless considerable interest—not to say some anxiety—will be felt in the result.

TOLLIUS.

THE Mid-European Motor Car Union intends to hold an automobile race from Berlin to Hamburg on June 17, with the object of testing the safety of the materials used in the construction of the vehicles.

THE Caledonian Motor-Car and Cycle Company, Limited, of Aberdeen, who are already the Scottish agents for Peugeot vehicles, have also been appointed sole agents for the Peugeot motor-carriages in Ireland.

THE encouragement of motor-cycling is to be considered by a special committee of the Automobile Club.

A NEW motor fire-tender is to be purchased by the Eccles Town Council to replace that damaged under circumstances reported in these columns last week.

ROTHSCHILD'S MOTORS, LIMITED, has been registered with a capital of £1,000 to acquire the benefit of and carry on the agencies for the sale in this country of the motors and motor-cars of the Deutsche Automobil-Industrie (Frederich Hering), of Gera-Untermhaus, in the German Empire, and of the Lux'schen Industriewerken Motorfahrzeug Abteilung, of Ludwigshafen-on-Rhine.

THE MERCEDES-SIMPLEX 40 h.p. CAR.

GREAT expectations are attached to the new models of the Mercedes car, the first of which has lately been turned out from the works of the German Daimler Company at Cannstatt, and of which we are now able to publish a few particulars. It only resembles the 1901 Mercedes in outside appearance. The four-cylinder motor has been denominated the "Mercedes Simplex," and the term is said to be justified by its appearance, no mechanism being visible except the four exhaust valve stems. Ignition is by a new style of alternating current apparatus without springs, rods, or contact breakers, and requiring no accumulators or coils; it is claimed to have the advantages of the magneto, and avoids the wearing parts of the latter.

The old governor has been discarded, and the motor is now controlled by a throttle-valve on the induction pipe, by means of which the speed of the engine may be varied from 200 to 1,200 revolutions per minute. The water-cooling apparatus remains as before, employing one and a half gallons of water only, but the draught-inducing fan between the cooler and the motor has been

THE PRESS ON MOTOR-CARS.

THE Automobile Club's letter to the Press, which we published last week, has drawn forth a series of articles which constitute a splendid tribute to the progress that automobilism is making in this country. A few extracts from some of the leading journals will be of interest to our readers:—

The *Times* says:—"Punishment, sharp and severe, should fall on those who insist in crowded streets upon driving at a perilous speed. The vain or hare-brained driver of an automobile, who in London or its suburbs tears along at the maximum speed, is a nuisance to be put down with a strong hand. But why, on a solitary part of the Great North Road, for example, with a straight run before the driver, he should not be free to travel at the rate of twenty miles an hour is not clear. Such a restriction is so unreasonable that it is not, and will not be, observed. We should gladly see a reconsideration of the whole question of speed in the light of recent improvements in motor-cars and of varying local conditions. No longer a toy, an article of luxury,

THE NEW "MERCEDES-SIMPLEX" 40-H.P. CAR.

(*La France Automobile*.)

dropped. Instead, the engine fly-wheel is made to serve as a fan, vanes being formed on it, as will be seen from the illustration. The speed gear-bearings, and practically all other bearings of the vehicle, run on balls; these bearings are on the Maybach system, and have a friction coefficient of .012. A special form of clutch is used between the motor and the change-gear box. The clutch is so arranged that when disengaged the speed of the motor is automatically reduced. The frame is mounted on equal sized wheels, the weight of the complete 40-h.p. chassis coming out at only 17 cwt.

WE hear that John Child Meredith, Limited, of Birmingham, are about to put a new 10 h.p. car on the market. The motor will be of the two-cylinder slow-speed type.

THE Vacuum Oil Company, of York House, Norfolk Street, W.C., have sent us samples of their lubricating oils for air and water-cooled motors, which are claimed to be especially efficient owing to their great friction-reducing properties.

for the amusement of a small minority, the light locomotive should be allowed to serve the public to the full extent of its capacity. The motor-car and wagon industry is at present in the state in which it is most susceptible of meddling, ill-advised legislation. At present the demand for serviceable motors exceeds the supply, and the probability is that, if these restrictions continue, the foreign producers will gain further advantages. No one would openly ask to be free from any conditions as to speed or otherwise which may be reasonably asked by foot passengers or owners of carriages. The communication which we have noticed leaves a strong impression that the industry has been kept in leading strings too long, and that the existing relations should be recast in the light of facts which were unknown or doubted in 1896."

Commenting on automobilism as a "manacled industry," the *Globe* says:—"If we are not to lose for ever the foreign and colonial markets, and if we are to keep pace with the steadily growing demand at home, it is absolutely necessary that every obstacle to the progress of this industry should be removed, and

that every inducement should be provided both for our manufacturers and our mechanics. The preservation of the public safety is, of course, a prior consideration, but the existing restrictions are shown to be due to ignorance and to panic, while the petty persecutions to which rural policemen and local boards and magistrates subject the owners of motor-cars are little short of scandalous."

While urging drivers of motor-cars to be careful, the *Nottingham Express* declares "it will be a serious misfortune if short-sighted legislation should cripple an industry which has a tremendous future in front of it."

To anyone who calmly considers the question, says the *Daily Telegraph*, it must be obvious that, "so far as the safety of the public is concerned, a motor-car at twenty-five miles an hour is less dangerous than a horse-drawn vehicle at half the speed, for the car can be stopped or turned about in a manner which no horse that was ever foaled can approach."

ACCORDING to the *Morning Leader* "it is impossible that the weighty protest of the Automobile Club should pass unheeded."

IN generally endorsing the letter from the automobilists the *Spectator* says:—"We may add our agreement with the proposal that a ready form of appeal should be given from the decisions of magistrates. We by no means think that the automobilist is always right and the country magistrate always wrong, but there is so much popular prejudice against the motor-car that it is only just that its driver should have an appeal to a tribunal which can be relied on as being without any unconscious bias."

THE *Glasgow News* says the protest is "justifiable," and that the "legal restrictions on automobilists ought to be put on a reasonable basis."

THE MATHOT EXPLOSION RECORDER.

THE Mathot apparatus for registering explosions is particularly interesting, because it permits of practically controlling the conditions of operation of internal combustion motors. Although it has been possible up to the present to control the state of regulation of such motors by means of diagram indicators, the results have been relatively satisfactory only when the velocity of the motor to be tested has remained within the limits of from 300 to 400 revolutions per minute. Since the motors of automobiles exceed such velocity, and easily reach the figure of from 1,000 to 1,800 revolutions, the most skilful experimenter cannot obtain a diagram under such conditions, and consequently cannot ascertain what phenomena are taking place during the running of the motor.

The apparatus devised by M. R. Mathot, on the contrary, owing to its ingenious construction, permits of following in an absolute manner, for a determinate time, the conditions of operation of any motor whatever be its rotary velocity. The apparatus is secured through the medium of a cock *r* to the explosion chamber of the motor to be tested. It consists of an arrangement analogous to that of diagram indicators, but the drawing is done upon a band of paper that unwinds in a continuous manner. The cylinder *C* is provided with a piston which is encircled by an opposing spiral spring *S*. A clockwork movement, housed in the box *b* actuates the band of paper, which unwinds from the spool *p* and passes over the drum *p'*, where it receives the imprint of the tracer *t*, and then winds around the spool *p'*. Besides, a small tracer *f* marks the "atmospheric line" upon the band of paper in passing over the drum *p*.

In order to prevent the piston *P* from "seizing" through the high temperature produced by the explosion, the cylinder *C* is provided with a jacket *e*, in which a circulation of water is assured by a small rubber tube fixed to the nozzle *e'*.

The apparatus having been secured to the motor, its piston is forced by each of the explosions to a height corresponding to the power of the latter, and the tracer controlled by the lever *t* registers them, one alongside the other upon the band of paper in motion. The velocity of the latter with respect to the number of revolutions of the motor to be tested is so regulated

that the lines representing the explosions shall be plainly juxtaposed. Their succession indicates not only the number of the explosions and revolutions within a given time, but also their regularity, their alternations with the "miss-fires," and their pressure in atmospheres measured by the scale of flexion of the opposing spring. The diagram obtained permits of determining experimentally the most favourable dimensions to give to the

FIG. 1.

admission and exhaust valve, by reason of the different velocities; of avoiding the resistance during suction and the counter-pressure during the exhaust that are the principal causes of losses of useful effect in high-speed-motors; and of estimating the role of compression, etc. The accompanying diagram shows that it is possible, from the indications given, to regulate, in an analytical manner, the operation of a motor, to ascertain what proportion of air, gas or hydro-carbon gives the strongest explosion, and to control the influence of compression, velocity, time of sparking, etc.

It is possible, also, to fix the amount of the resistance during suction and exhaust. To this effect, it suffices to compare the origin of the lines of explosion with the atmospheric line

At 800 revolutions 4-h.p., with 80 per cent. explosions. At 600 revolutions 4½-h.p., with 66 per cent. explosions.

FIG. 2.—Part of a diagram taken from a 6 h.p. motor running at 75 per cent. load, showing the increased efficiency obtained by a reduction of the speed and the changing of the carburettor.

marked by the tracer *f*. The complex phenomena that accompany the operation of explosion motors are by this apparatus verified in a scientific and positive manner, and its use by manufacturers will undoubtedly permit them to introduce modifications into the arrangements that they have adopted, with the effect of improving the efficiency of their motors.

FROM Messrs. A. Darracq and Company, of Suresnes, near Paris, we have received a copy of the 1902 catalogue of Darracq cars. In addition to general views of a variety of different types, a number of pages are devoted to a description, accompanied by sectional illustrations, of the various parts of the motor and the mechanism. Altogether the catalogue is very complete and interesting.

FLOTSAM AND JETSAM.

BY FLANEUR.

THE day of Club touring is regarded by many as being over, and for future undertakings of this kind it is proposed to arrange a definite object at the rendezvous, in the shape of speed trials, or some kindred attraction. It is true that last year's tours were not numerous attended, but the reason is not by any means, it seems to me, that combined touring has lost its popularity, but rather the difficulty of making an automobile tour that really is combined. Experience has shown that there is nothing so unsociable as a tour on motor-cars, notwithstanding the fact that there is a closer bond of common interest among automobilists than almost any other body of men. Not many people will deny that the cause of this unsociability is entirely mechanical. Motor-cars are of all types and powers, and to keep them together, unless in an organised procession, with a pilot who must not be passed, is impossible. A 20-h.p. car cannot be expected to go the pace of a 6-h.p. Even with two cars of less obvious disparity, the pace of which is virtually equal on the level, one will prove itself a little stronger on the hills, and get up on its third or second speed when the other has to change on to its second or first. So the gap gets longer and longer, and nothing but a mishap of some kind or other to the front car will bring the two together again.

THE LOCOMOBILE STATION AT ARDSLEY-ON-HUDSON (see page 20).

It is not easy to see how this state of things can be avoided, excepting in the case of cars of nearly equal power, whose owners mutually agree to keep one another company. If one draws gradually out of sight of the other it is not difficult to pull up for a few moments. The result is occasionally as surprising as it is gratifying. On one long journey, for example, to which I may refer, I formed one of a party of three tourists, and the cars we drove had little or nothing to choose between them in respect of power. The slight differences that did exist would have doubtless become accentuated in the course of the day's run, but we had agreed to keep practically together. Now, quite apart from the sociability of this arrangement, each one of us benefited thereby in turn. Two punctures were the fate of one, and though these, of course, he could have repaired alone, the job was more quickly done with the assistance of his friends. Another ran out of lubricating oil, and his car, moreover, was one in which a central reservoir fed most of his bearings, so that when he "dried up" it would have been serious if one of his companions had not had a plentiful reserve supply.

The third member of the party, near the close of the day, happened to break down completely, and his car was towed to a place where it could be stored for the night; otherwise it would

have had to be left on the roadside, five miles from any station. He then boarded one of the other cars. Each of the aforesaid incidents, be it noted, happened when the car which was the subject of the particular mishap was in the rear, and if the other drivers had not, on missing the absentee, gone back to find him, there would have been distinct inconvenience to each member of the party in turn, for it was Sunday evening on a comparatively deserted road in midwinter. Clearly there are occasions when sociability pays!

As a set-off against a good deal that automobilists have had to put up with in the past, and in magisterial and certain other quarters have still to endure, one may note a distinctly improved feeling, on the whole, where the public is concerned, when driving in the suburbs particularly. I rarely encounter a hostile glance

nowadays, though often one of careful criticism, as though the spectator were looking out for a car to buy, and speculating as to what the one might be that I was driving, and whether it would suit his individual requirements. What is particularly gratifying, however, is that in some cases one meets with distinct friendliness from people who know absolutely nothing about motor-cars, technically speaking, but have recognised that they have come to stay, and regard them with some amount of interest accordingly. A day or two ago I was driving on a friend's car, and we stopped to oil up, after a long run, on the outskirts of a large town.

The car gave a back-fire after we pulled up, and a very loud one it was. A gentleman who was in the garden of a large villa near at hand promptly came out to inquire if he could be of any assistance! From the questions he asked about the car it was obvious that he did not know one end of a car from the other, nor whether ours was of the steam, electric, or petrol type. He had come to proffer his services out of sheer good nature, and I, for one, could wish that everyone equally uninformed as yet in automobile matters were as free from prejudice and hostility.

THE recharging of accumulators is to some automobilists a simple matter, to others it is not, according to the distance that one lives from a charging station. I was staying lately at a country house at which three cars were kept, and there was no place within fifteen miles where the batteries could be recharged. In urban districts, of course, this case could hardly be paralleled, but even then there must be not a few car owners who would like to be able to charge their accumulators in their own house if that were possible. The electric lighting of even suburban houses is not yet general, however, but it is rapidly extending, and if only the continuous current were employed one might look forward to a time when the automobilist could draw upon his household supply as a matter of course.

UNFORTUNATELY, however, the use of the alternating current for urban installations is becoming the rule rather than the exception, and to recharge from an alternating current is impossible without a special apparatus. Such an apparatus, however, does exist. I was discussing automobile matters the other evening with a gentleman who is the borough electrical engineer of a well-known Surrey town, and he told me all about an appliance by the aid of which an accumulator can be recharged from an alternating current. It is called the "Batten patent rectifier," and appears to be a very ingenious device. Not being a professional electrician myself, I should hesitate to say anything about it but for the fact that it was brought under my notice by one whose imprimatur was of both practical and independent value alike.

THE technical description of the "rectifier" is as follows:—
 "This apparatus is a polarised relay, whose tongue moves synchronously with the alternations of the current, and sends unidirectional impulses into either of two paths, which it opens for itself, and is independent of alterations of frequency or voltage. It will work with a much lower percentage of wasted energy than would result from doing the same work on a direct-current circuit through charging lamps. It will start at once at full load, without speeding up, without expert attendance, and without delicate mechanical starting devices. It will carry six ampères at 50 volts, and a larger current at lower voltages. The apparatus is formed of a step-down transformer and a polarised relay, which consists essentially of one or more electro-magnets, and of a polarised armature carrying a contact piece. The armature is free to move or rotate through a small angle on its pivot, and is polarised by means of two permanent magnets, the two similar (say south) poles of which are touching one another. By means of two soft iron studs these convey their magnetism up to the centre of the soft iron armature, and induce a consequent north pole there, with the result that the two ends of the armature become south poles, and do not change their polarity.

"If an alternating current is passed through the electro-magnet it produces alternating magnetism in its ends; that is to say, the magnetic polarity changes rapidly north and south. They will therefore alternately attract and repel the ends of the armature, where the magnetism remains constant, and the armature will oscillate backwards and forwards between the poles of the electro-magnets exactly in synchronism with the alternations of the current energising them. In order to make use of these oscillations to convert alternating current into unidirectional or direct current, the armature is made with a contact piece of silver, which at the end of its movement makes contact with twin stops. The alternating current from the secondary of the transformer traverses the armature and contact piece, and passes on through any circuit connecting these stops to the return lead of the secondary of the transformer. When the current is passing through the electro-magnets in the positive direction, the armature carrying the transformed current will always be attracted to the same side, and will make contact with the same stop; during the next fraction of a second, when the current has changed its direction to the negative, the armature will move over to the other side and make contact with the other stop. These stops will, therefore, each receive impulses of one kind only, and these impulses can be carried through an electric circuit where work is to be done; thus, instead of an alternating current, two unidirectional or direct current circuits are obtained."

APPLICATIONS from members of the Automobile Club for seats at 119, Piccadilly, W., to view the Coronation procession, are now being received.

A SERIES of articles by the Hon. C. S. Rolls, on motor-cars as the method of conveyance in the twentieth century has commenced in some provincial newspapers.

In connection with the Liskeard Literary Institution, Mr. G. H. Micklewood, who recently lectured at Plymouth, has just given a lecture on "Motor-cars and Road Traction."

MISCELLANEA.

MESSRS. F. G. BROWN AND CO. have established an automobilists' agency at 8, London Street, Fenchurch Street, E.C.

SIR DAVID SALOMONS has entered for the *caravane* from Paris to Nice. He will drive his 20 h.p. Panhard.

THE Swiss Automobile Club is organising a hill-climbing contest over a distance of 20 kilometres, for the month of August next.

A MOTOR-CAR exhibition is to be held in Berlin from May 15th to 26th next. It is being organised conjointly by the German Automobile Club, the Mid-European Motor-car Union, and the German Motor-car Builders' Association.

THE Gordon Motor and Cycle Company, of Seven Sisters' Road, Finsbury Park, are about to open a garage at the rear of their premises large enough to hold any size of car. An inspection pit is in course of construction, and when the alterations are finished the company will be in a position to execute repairs of all cars.

REFERENCE has already been made to the stand for motor-bicycles devised by Mr. A. Craig, of Putney. We are now able to illustrate the arrangement which supports the machine at the bottom bracket and at the handle-bar, the rear wheel resting lightly on a roller, which gives about the same resistance as would result in driving upon the road. The bicycle can consequently

be mounted and started in the ordinary way by pedalling, and thus tried before starting out for a run. The stand, which will also be found useful when cleaning and adjusting the machine, has been put on the market by the Ormonde Motor Company, of Wells Street, London, W.

DURING this week a 8 h.p. motor-car has been leaving the Great Central Station (Joint), Stalybridge, four times a day, carrying at each journey an average of twelve bales of cotton, or 2½ tons, and returning to Mossley with loads of yarn and other goods. The vehicle can do the journey in 40 minutes, easily making four journeys per day.

A REPORT by Mr. H. Sturmev with regard to the inauguration of a motor-car industry at Exeter is now under consideration by a special committee of the Exeter Chamber of Commerce. He suggests that for the establishment of a business to make a car, retailing at £500, three acres of land would be required, and a capital of from £47,500 to £65,000. Upon the sale of 300 cars at £500 each Mr. Sturmev estimates a net profit of £25,000. He adds that such a result could not, of course, be obtained the first year.

AT Easter the English Motor Club will make Worthing their headquarters, making tours from that centre into the surrounding country. On the 12th prox. they will have a run to the "Swan" at Bedford, and on May 3rd to the "Mitre" at Oxford, where they hope that the Reading Club will be able to join them. On May 31st a contest in the grounds of the Crystal Palace will be organised, and on July 12th the hill climb up Tilburstowe, which attracted much attention last year, will be repeated.

AN umbrella for all vehicles, including motor-cars, and known as the "Benham," has been introduced by Messrs. Sangster and Co., Ltd., 140, Regent Street, W.

WE are now able to give an illustration of the new American petrol car described in our last issue. It is known as the Olds-

mobile, and is made by the Olds Motor Company, of Detroit. It will be on view at the forthcoming show at the Agricultural Hall.

A COPY of the catalogue issued by the Elmore Manufacturing Company, of Clyde, Ohio, U.S.A., has reached us. It gives particulars of a light 5-h.p. petrol car they are now turning out.

CAPE TOWN is being agitated over a proposed regulation of the Divisional Council that motor-cars shall be restricted to a speed of six miles an hour in the city and suburbs and to a maximum of eight miles an hour on country roads.

THE Bradford Motor Car Company stock Pratt's motor-spirit and Carless Capel's petrol, and have, at the present time, fifty-two motor-cars in stock. They do a large business in letting motor-vehicles on hire.

A REPAIRING department and garage has been opened by the Daimler Motor Company, Limited, at Brownlow Mews, Guildford Street, London, W.C.

THE Thornycroft Motor Wagon Company of America is about to be incorporated to acquire and work the patents, improvements and rights in the Thornycroft steam wagons in the United States and her possessions.

MR. CHAS. E. MILLER, of 97, Reade Street, New York, has sent us a copy of a most complete list of motor-car parts and accessories he has just issued. The catalogue, which extends to over seventy pages, appears to include everything for steam and petrol vehicles, from a spring up to a complete car.

THE Municipal Council of Footscray, near Melbourne, Victoria, has for years been trying to persuade the Railway Department to lower the railway fares on the Williamstown line to the same rates as charged to other Melbourne suburbs. The Council's efforts having been unsuccessful, it has lately been in correspondence with the Helios Incandescent Gas Light and Automobile Company, and a sub-committee has arranged to consider the offer of the company to run a service of passenger motor-cars between Melbourne and Footscray.

A CAPITAL catalogue has been issued by the Hozier Engineering Co., Ltd., of Hozier Street, Bridgeton, Glasgow, the manufacturers of the well-known Argyll motor-cars and delivery vans. Some excellent illustrations of the works of the company are given, and also sketches and plans of the Argyll 8-h.p. light car, fitted with various bodies, including a tonneau, double phaeton, and two-seated, as well as a good type of delivery van. Several illustrations of the details of the car are also reproduced, including the back axle, which is hung on roller bearings. The gearing is also fully described, and we notice that the clutches in the gearbox are now slightly dovetailed into each other so that no strain can be transmitted on to the striking fork.

EFFORTS are being made to form an automobile club in Blackburn.

MESSRS. PANHARD AND LEVASSOR, of Paris, are building six 16-h.p. motor-lorries for service in Madagascar.

AN automobile club has just been formed at Bruges, Belgium.

THERE is a coffee estate in British Central Africa for which the owner would accept £2,500, and take motor-cars in part payment.

THE Aero Proprietary, Limited, has been registered with a capital of £1,100, in 1,000 £1 preference shares and 2,000 1s. ordinary shares, to assist aerial navigation, to provide a club-house, etc.

THE *Scientific American*, of New York, has just issued a special "Automobile and Outing" number. It includes several interesting illustrations and descriptions of a variety of modern American steam and petrol cars.

THE Provincial Gas Traction Company, Ltd., has been registered with a capital of £6,000 to construct a system of tramways between Neath and Briton Ferry, Glamorganshire, and to carry on business as motor-car and van proprietors.

Two years ago five of the employees of the Motor Manufacturing Company at Coventry joined the Imperial Yeomanry and left for the front. We regret to hear that one of these, Trooper George Drury, has died at Klerksdorp from wounds received on the 28th ult.

MR. A. W. GOODALL, who has been connected with the motor industry for many years, and who was until recently manager of the Roadway Autocar Company, Ltd., has been appointed by the Brush Engineering Company, Ltd., manager of the large motor-car showrooms this concern are just opening at 66, Great Russell Street, London, W.C.

FROM the United Motor Industries, Ltd., of 42, Great Castle Street, Oxford Street, W., comes a copy of their new lubricator list, which is one of the most comprehensive of the kind we have seen. The list includes a description of automatic automobile lubricators in which each outlet can be regulated to a nicety. Each outlet has a drip feed that is easily regulated by a plug, and once given the drip required it works without attention. Round oil-distributing lubricators, cups adaptable for motor-tricycles and bicycles, tanks for motor-cycles, reservoirs for voiturettes, etc., are all illustrated and described in this list. The accompanying illustrations show the special tanks for carrying spare quantities of petrol and lubricating oil on motor-bicycles that have been put on the market by the United Motor Industries. The tanks are divided into two compartments, one holding five pints of petrol and the other a pint of lubricating oil, a pump being also provided in connection with the latter. The tanks

are made in two forms, one with clips to attach to the head of the machine, the other with clips for attachment to the back stay, and will be found useful by those motor-cyclists who wish to travel in remote country districts, where they cannot rely on obtaining fresh supplies of petrol and lubricating oil.

CORRESPONDENCE.

FRANCE COPYING ENGLAND.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that your correspondent, Mr. Hector, in the issue of the 1st inst., seems to have a bias in favour of English cars. I think he is hardly right in trying to set up the horizontal cylindered Wolseley as comparing well with the French productions. Everyone who has driven horizontal cylinder cars know their disadvantages, and that is the reason why every up-to-date foreign firm has given them up. The Benz, with its horizontal cylinder, is hardly considered a representative German car to-day, and the Peugeot, while they continued horizontal cylinders, fell from a first rank into a second or third.—Yours truly,

GEO. HENDERSON.

COST OF MAINTENANCE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—In reply to recent inquiries in your *Journal*, I give the following account of my yearly expenditure in connection with my car, which is fitted with an 8 to 12-h.p. motor. It has run nearly every day a distance of 30 to 40 miles.

	£	s.	d.
Petrol, 1s. per gallon	60	0	0
Re-covering and repairing tyres	85	0	0
Paraffin, grease, polish, brushes, rubbers, etc.	25	0	0
Lubricating oil and acetylene	27	5	8
Insurance and motor licence	24	4	0
Replacement of broken or worn-out parts	25	0	0

My mechanic had seven years' apprenticeship as engineer, and for over three years was superintending building and examining motors for one of the largest firms in Paris. He does all repairs to the car, and we have never been delayed more than twenty minutes on the road for a temporary repair. He has £150 a year and house found. I expressly give the above statement, as I think it is only fair to our industry and skilled workmen, as well as to our safety, to employ a thoroughly experienced engineer and not an 18s. a week man who would do more harm than good to a motor. The result would be similar to that I met on a run last year from Dover to London, when I came up to a gentleman with an 18s. per week driver who had a slight break-down, as he called it, and had been nearly four hours in finding out where the fault lay. Neither owner nor driver had been able to locate it, and on my saying that it would be more profitable to pay a good mechanic, he replied that he did not see the fun of paying such an enormous sum as £2 or £2 10s. a week and have fellows half of the time idle. My engineer in the meantime had found out the hitch and was just in the act of getting some tools out of my car when he overheard the remark of my chance acquaintance. He then said that if such was the case he absolutely refused to give a helping hand; so we left him. I later found out that the car had to be taken away by horses and had to be repaired by a mechanic. Therefore I quite agree with your correspondent H. J. D., and would ask what sort of a man would M. B. have for his £50 a year.—Yours truly,

A MOTORIST.

THE NAPIER CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—Mr. Edge has now put his claims more definitely, and we regret that from the historical point of view it behoves us to show that at least some of these are without foundation.

1. With regard to the "Panhard" type of car that Messrs. Napier are making, Mr. Edge claims that Messrs. Napier were the first to use aluminium water-jackets; but, as we said before, the substitution of one metal for another does not demand any great inventive genius, nor do we consider that it possesses sufficient merit to talk about.

2. Straight exhaust valves stems. We have always used straight stems on all the valves of automobile motors and never thought of using any other, and we made the first automobile petroleum motor-vehicle made in this country. The photograph of this first petroleum car is on the walls of the Automobile Club. Indeed, taken literally, it seems almost an absurdity to us to think of making other than straight stems for an exhaust valve. Our Mr. Roots exhibited a tricycle vehicle-motor with straight exhaust valve stems in the year 1893 or 1894 at the Stanley Show, and some of these motors were sold in France. With one exception, our Mr. Roots was therefore the pioneer in this country of automobile internal combustion engines. It will be seen by a reference to illustrations of Mr. Roots' construction of petroleum motor-tricycle in 1892 and the subsequent De Dion motor-tricycle how very similar the arrangement was.

3. The "boldness" of this lies only in its incorrectness, for certainly automobile vertical and horizontal motors had been made before with "electric ignition only." It is evident that Mr. Edge is not well acquainted with the previous motors that have been made in this country, or with the history of the subject.

4. Mr. Edge claims to have first used "enclosed valve gear and cam-shafts. The motor referred to, which propelled the first petroleum motor-carriage in this country, had enclosed valve gear, and cam shafts.

5. With regard to his fifth claim, this may be correct, but Mr. S. F. Edge appears to object very much to "unconfirmed statements" in the

remainder of his letter, and yet this appears to us to be of that description It would be interesting to know the weight of the 40-h.p. Buchet.—Yours faithfully,

ROOTS AND VENABLES.

MOTOR-BICYCLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Several correspondents have honoured by notice my letter in the *Journal*, but they have not apprised your readers where a motor-bicycle may be found to be as satisfactory as those they allege they have met with themselves. I am reminded that persons who do not learn to adjust tremblers, to explore electrical apparatus, to prevent short circuiting and numerous other weaknesses, and who do not care to foul their clothing with many unclean operations, should not presume to ride motor-bicycles; but I do not perceive that makers propound such a doctrine, but rather claim that riders will discover no troubles to surmount. I contend that manufacturers and agents are the people upon whom devolves the duty of seeing that their wares are equal to expectation, and not their customers. —Yours truly,

J. A.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—If Mr. Booker finds his 2½ in. by 2½ in. by 6 in. discs strong enough to take him up average Kentish hills, will he tell us what it is, who made it, and what the horse-power is, as these arithmetical formulæ express nothing to most of us? If it will run up the by-roads near Hind Head without pedalling, it will take any Alpine trail, as the worst Alpine carriage road I ever saw is infinitely better graded with an easier gradient than the best English one. Of course there are many bad Alpine roads, just as there are a few, very few, good English ones. But when he talks of there being practically no loss of power in a belt by slipping—well, I would like to see that belt! Mr. Kennett is also to be envied for his experiences. I can only say that, first, I do not remember any occasion on which I have ever ridden fifty miles without something going wrong; and, secondly, I am hunting for the machine which will take me two hundred miles a day, day after day. What is wanted is a powerful engine fitted to a strong bicycle. Where is it to be found?—Yours truly,

JOSEPH PENNELL.

TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Another vexatious question for motorists has arisen in connection with tyres, and I should be glad of information on the following points:—(1) Are users of the Michelin tyres responsible to Dunlop's, and those bought before the amalgamation? (2) When did the amalgamation take place? (3) Can any prohibition be issued against private users of Michelins bought in France and used in England? (4) Are tyres bought with cars allowed to be sold with cars if not new? (5) What is the number of the patent, and is it so drawn out that any tyre made of rubber is an infringement? Having not the slightest interest, save in the welfare of the motorist with a moderate pocket, I think it a pity that some enterprising firm cannot keep out of this great monopoly and manufacture as good tyres at a reasonable price; and so be beneficial to all, except shareholders in these monopolies, which, I understand, are taking up the manufacture of cars, so that the consumer will have no option as to what tyres he will have.—Yours faithfully,

AUGUSTE KENT.

AUXILIARY ENGINES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was lately induced to buy a 3½-h.p. Benz car. As a beginner I have had lots of fun, but the car always brings me home safe and sound. On level roads the speed is quite sufficient, but on hills we quarrel, Crypto being the order of the day. I wish to ask: Could not some of our smart motor-engineers fit a small auxiliary engine, say, of the De Dion type, with a lever and clutch, to assist on hills?—Yours truly,

ERNEST SMITH.

C. W. K. C. writes:—"Would any reader kindly let me know if any motor-bicycle exists in which petroleum is used and not petrol? I wish to take a motor-bicycle to India with me, but the difficulties of obtaining petrol out there seem so great that I have decided to get one driven by petroleum, if possible. Would acetylene gas be any use in the place of petrol?"

In connection with the New American car referred to in our last issue A. S. L. writes:—"In the description of this car one characteristic point is omitted, viz. the very low speed, about eleven or twelve miles an hour only. The engine is of 4 h.p., yet with a ½ h.p. less the De Dion travels at eighteen miles per hour. Is the loss of power due to the mode of silencing, or is there some mistake about the real horse power of the motor?"

MESSRS. F. WILKINSON AND Co., of Cornbrook, Manchester, are introducing a number of new accessories for steam-cars made by the Locke Register Company, of Salem, Mass., U.S.A. One is a water-tank filler, which consists of a suction device operated by a steam valve, the water being sucked up and the tank filled in a very few minutes, with no material reduction in the steam pressure. The other new devices comprise a steam engine cylinder lubricator, actuated by the condensation of steam, and an improved throttle-valve.

FORTHCOMING EVENTS.

MARCH.

- 22.—Annual dinner of the Lincolnshire Automobile Club at Lincoln.
25.—Quarterly 100-miles Trial of the A.C.G.B.I.
27.—Start of A.C. Easter Tour for Cromer.

APRIL.

- 6.—Commencement of Nice Automobile week.
8-17.—Nice-Abbazia Race.
11-27.—Automobile Exhibition at Copenhagen.
19-26.—AUTOMOBILE CLUB'S EXHIBITION at the Agricultural Hall.
23.—Special day at the EXHIBITION at the Agricultural Hall.

MAY.

- 3.—Hill climbing Trial on Dashwood Hill.
16.—Start of A.C.G.B.I.'s Whitsuntide tour.
19.—Speed trials at Bexhill.

FURIOUS DRIVING CASES.

ARCHIE THOMAS was summoned at Bristol for driving a motor-bicycle at an alleged furious pace. The defendant pulled up near Bath Bridge, and according to the evidence of the police he was travelling about sixteen miles an hour. The magistrates imposed a fine of 10s. and costs.

At Newcastle Police Court, Frank L. Ellingham was summoned for having on February 21st, while driving a light locomotive in Grainger Street, unlawfully failed to comply with a certain regulation contained in Article IV. of the Light Locomotive and Highways Order, 1896, by driving it at a speed greater than was reasonable and proper having regard to the traffic. The defendant was further charged with having, on the same date, driven his car on the wrong side of the road when meeting another carriage. Defendant pleaded "Not guilty." Police-Constable Johnson stated that at 9.30 a.m. on February 21st he saw the defendant driving a motor-car along Blakett Street. He went over to the right hand side of the road, and passed round the Monument on his wrong side. He went down Grainger Street on his wrong side, meeting all the traffic. He so increased the speed of his car as to catch up a tram which was about a hundred yards in front of him on rounding the Monument, and which was travelling at a rate of at least five or six miles an hour. The motor-car would be going at fully eleven miles an hour. Defendant's employer gave evidence that it was on his instructions that the car was driven round the Monument behind the tram. He denied that the car was travelling at excessive speed. His car had gone about 25,000 miles, and only had one accident, when a hen was killed. He had driven round London, and this boy was a very careful driver. Councillor Beattie (chairman) said the magistrates were bound to administer justice, and would impose a fine of 10s. and costs in each case.

THE STORAGE OF PETROL.

WILLIAM PARRY, of the Minerva Motor Repairing Department, 158, High Holborn, W.C., appeared at Bow Street Police Court to a summons charging him with keeping petroleum spirit, for the purpose of light locomotives, in a storehouse situated within twenty feet of another building, without giving due notice to the local authority, contrary to the regulations made by the Secretary of State, under Section 5 of the Locomotives and Highways Act, 1896. Mr. W. E. Helman Pidsley supported the summons on behalf of the London County Council; Mr. Cobbing appeared for the defendant. Mr. Pidsley said that according to the regulations everyone who kept petroleum spirit within twenty feet of a building or timber-stack should give notice to the local authorities, and renew the notice every year. A short time ago one of the County Council's inspectors visited the defendant's premises in High Holborn, and found in the workshop two cans with screw-tops, each containing one gallon of petroleum spirit. One portion of the spirit had been taken from the tank of a motor-bicycle, the other had just been brought in from the yard. The cycle from which the petroleum was drawn was fixed in a stand five feet from a fire burning in an open grate. Of course, with such an inflammable spirit this was a very dangerous proceeding, especially as the workshop was in the centre of a dwelling-house. Mr. Cobbing said the defendant had no intention of breaking the law. He had only just started this business, and no doubt would in due course have given the requisite notice. It was not unlawful to have petroleum spirit stored in a tank attached to a cycle, but there could be no doubt that in this case a technical offence had been committed, and the defendant was very sorry for what had happened. The defendant was fined £4, and 2s. costs.

ALLEGED NEGLIGENT DRIVING OF A MOTOR-CAR.

At Marylebone County Court, on Tuesday, before Judge Stonor and a jury, Mr. E. G. Holt, a cab driver, brought an action against Mr. F. Frentzel and Dr. E. Lehweß. The claim was for £50, in respect of personal injuries said to have been sustained owing to the negligence of the defendants or their servants in the driving of a motor-car. Mr. Bartlett Ellis, counsel, appeared on behalf of plaintiff, and Mr. Staplee Firth, solicitor, for both defendants. The case was before the court on January 28th, when, after a long hearing, the jury were unable to agree. The judge then said that the case would have to be tried before another jury. Plaintiff's counsel now explained that his client, who was seventy-two years of age, was driving a four-wheeled cab on the night of March 20th last year along Bayswater Road towards Notting Hill. The old man was driving quite slowly after his day's work, and keeping well in to his near side. When the cab had got between Albion Street and Hyde Park Street a motor-car, driven, it was said, by Dr. Lehweß, came along behind and struck the hind wheel of the cab. The impact was so forcible that the plaintiff was pitched off his

box into the gutter, sustaining the fracture of two ribs and other injuries. Mr. Ellis added that after the accident the plaintiff was taken to St. Mary's Hospital, and subsequently treated at home by another medical man, but, owing to the injuries, he developed pleurisy and pneumonia. The plaintiff bore out his counsel's opening statement. He added that Dr. Lehweß and Mr. Frentzel had called upon him once or twice, and on each occasion left half a sovereign. Cross-examined: It was not a fact, however, that he was asleep at the time of the accident, or that the reins were hanging loose upon the horse's back. Although he heard the noise of the motor-car coming up behind he did not hear the horn of the car sounded. He denied that his cab suddenly turned immediately in front of the motor-car, in order to go up Hyde Park Street.

After corroborative evidence was given, Mr. Frentzel, one of the defendants, said he was a motor engineer, but also dealt in motor-cars. The car in question was an Orient Express, one of the smallest four-wheel motor-cars made. It was he who was driving the car, and he was going quite slowly. As he overtook the plaintiff's cab he sounded his horn two or three times. The cab, however, suddenly turned just in front, and struck the motor-car. He noticed that the cabman had his head down, and going from side to side, as though he was asleep. If the plaintiff's cab had gone straight along, or he had given the usual warning with his whip before he turned, the collision would not have happened. Dr. Lehweß corroborated the evidence given by Mr. Frentzel. He was sure that the plaintiff was sitting on the box of the cab fast asleep, and that the cab turned suddenly in front and struck the motor-car. He was not driving the motor-car, although he had a waterproof coat on, such as is sometimes used for motoring.

His Honour put to the jury questions as follows: (1) Which of the defendants do you think was driving the motor-car at the time of the accident? (2) Was the driver of the motor-car guilty of negligence, causing the accident? If so, (3) what damages is the plaintiff entitled to? In his summing up, the judge said there could be little doubt but that Mr. Frentzel was the driver of the motor-car, and not Dr. Lehweß; and that if the jury found in favour of plaintiff the damages should only be moderate. The jury returned a verdict to the effect that Dr. Lehweß was driving the car, and that he was guilty of negligence, causing the accident, and they assessed the damages at £30. The judge: I give a new trial. It is a very bad verdict.

RE THE AUTOMOBILE MANUFACTURING COMPANY, LIMITED.

UNDER the winding-up order recently made against the Automobile Manufacturing Company, Limited, the statutory meetings of creditors and shareholders were held at the Board of Trade Offices, Lincoln's Inn, on Tuesday. The chairman said that he was not yet fully in possession of the facts in connection with the company, but it appeared to have been registered in April, 1900, with a capital of £100. This capital, however, was almost immediately increased to £15,000. The company was promoted to acquire the goodwill and assets of two businesses, one being that of an electrical engineer, while the other was carried on under the style of the Southern Motor-Car Company. No valuation appeared to have been made of the assets taken over by the company, which was registered without articles of association. A prospectus, dated June 14th, 1900, invited subscriptions for 5,000 shares. All the shares were applied for, but the allotment of some was cancelled; of the total shares allotted 2,240 were subscribed for by directors of the company. The consideration for the sale of the business was £10,130, payable as to £10,000 in shares of the company and £130 in cash. There were three matters which called for inquiry, namely, the cancellation of the allotment of some of the shares, the issue of debentures in July and August last to secure directors of the company against an advance made by the bank, and the question of one of the directors' liability on £1,000 of vendor's shares. A draft statement of the company's affairs was furnished, showing liabilities £3,787 4s. 11d., and assets £3,718 5s. 10d., while, as far as the official receiver could ascertain, the total deficiency with regard to the shareholders amounted to some £6,000. A resolution was passed leaving the matter in the hands of the official receiver as liquidator.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, MARCH 22, 1902.

[No. 159.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT a meeting of the Aeronautical Society in London last week, Dr. Burton, of Beckenham, read a paper, in the course of which he described a flying machine of his invention, which he is constructing for the War Office. It is a combination of the gas vessel and screw propeller principles, the balloon being fish-shaped and divided internally into four compartments. The framework is to be constructed of tubular steel and will have a number of aeroplanes capable of being inclined at will, by means of which the machine will be elevated or depressed. The car is to be made of nickel steel, and there will be a deck of light steel network. The total length of the vessel will be 104 feet, and the width of the deck will be 2½ feet. The driving mechanism consists of six screw propellers, coupled to petrol motors, each propeller being 17 feet in length. It is proposed to preserve the centre of gravity of the vessel by a system of water circulation.

The Reading Club. At Easter the Reading Automobile Club will have a run to Wantage via Pangbourne and Goring—a distance of twenty-nine miles; and at Whitsuntide will hold a meet at Swallowfield Park, by the invitation of Sir Charles and Mr. Arthur Russell. A motor gymkhana is also in contemplation, as well as a Club meet at Mr. Alfred Harmsworth's residence at Guildford; a picnic to Savernake Forest, a three days' tour to the West country, and runs to Oxford, Basingstoke, Taplow, etc. On Friday (the 21st inst.) Mr. A. Phillips was announced to read a paper on the "Lubrication of Motor-vehicles." The Reading Club is certainly one of the most active of the provincial automobile organisations, and the new issue of its *Gazette* evidences considerable enterprise on the part of its Committee.

Drivers' Licences.

At the last meeting of the Hythe Town Council an interesting discussion took place on application for motor-car drivers' licences being made on behalf of two employees of the Folkestone Motors, Limited. Evidently the Council looked upon the applicants much as do country justices on the "conscientious objector," and everything possible was urged which might be used against the application. The town clerk had served certain notices on the secretary of the company, about which the engineer naturally knew nothing, and consequently he was questioned on matters of which he was not conversant, and the time of the Council wasted, simply because a common-sense attitude could not be adopted by those armed with a little brief authority. After all the talk, which fills nearly a column of the local newspaper, the licences were granted, and it was acknowledged by the Mayor that the cars of the Folkestone Motors, Limited, were exceptionally well behaved vehicles—a characteristic which could also be applied to the drivers.

A Pleasant Function.

ON Tuesday evening a few friends dined together at the Carlton Hotel, London, the occasion being the presentation of a handsome silver-fitted bag to Mr. Claud Johnson, as a mark of their regard and admiration of his work in connection with the Automobile Club. Mr. Roger Wallace, K.C., presided, and both he and Mr. Alfred Bird eulogised the services of the Secretary of the Club, the latter appropriately responding. A most enjoyable evening was spent by those participating in the pleasant function.

Motor Ambulances.

In recent issues we have drawn attention to the success which has attended the adoption of automobile ambulances in America, and again we would urge that the London County Council should try mechanical means instead of relying on horses for the new ambulances which it proposes to station at various points of the metropolis. Further proof of the utility of motor ambulances comes this week in the fact that the leading hospital in Boston, U.S.A., has ordered a new electric ambulance, and that the governors of several hospitals in New York State have done the same. Had experience not shown their reliability Americans would not have given so many orders for such vehicles.

Doctors and Income Tax.

IN the course of a chat with a well-known doctor who owns an automobile, our attention has been drawn to an anomaly which ought to be considered by those interested in the welfare of the motor-car industry. A professional man using a brougham in the course of his visitations can claim a rebate from the sum on which he pays income-tax on that account. Should, however, a doctor substitute a motor-car for his horse and brougham no rebate is allowed—a piece of red tape absurdity that should surely be exposed not only by the manufacturers of automobiles but also by the organisations responsible for looking after the affairs of medical men. Of course the system may vary, and what the surveyor of income-tax in one locality will allow, the official in another district may reject. But we know of several doctors whose possession of a motor-vehicle has resulted in their having to pay on a larger income than would have been the case had they been content with an antiquated brougham.

Trips and Tours.

THE fine weather on Sunday brought out many motorists to the places where pleasure seekers congregate. There was a large collection of cars outside the Star and Garter, at Richmond, and within a few minutes we saw a Lanchester, a Rochet-Schneider, a Renault, and a Locomobile, to say nothing of half-a-dozen familiar vehicles. In some of the southern suburbs motor-cyclists were to be found everywhere—heralds of the numerous army of motor-bicyclists likely to be seen on the roads ere long. From the days of short trips to those of longer tours is no great distance, and we hear of many small parties of motorists

being formed for Easter tours. Altogether the motor season for 1902 has opened well, and the forthcoming exhibition will give it a decided fillip.

Clubs in America.

THERE is much agitation in the United States concerning the clubs that have been formed for automobilists. Many of these have been of an exclusive and an expensive character, and a suggestion has been made that an association should be formed to embrace all interested in automobilism who cannot afford the luxury of the club. A national association of the clubs has been formed and also a league of unattached individuals; and each organisation is seeking to claim precedence. The result of the rivalry it is contended will be to boom the movement—whatever the effect on the prosperity of the individual organisations.

Municipal Enterprise.

MR. WILLIAM WEAVER, the Borough Engineer of Kensington, is an enthusiast for the adoption of mechanical methods of locomotion in London streets, and we well remember his advocacy of automobiles at a meeting of the Automobile Club two winters ago when Colonel Crompton read a paper on street locomotion. Mr. Weaver has, indeed, carried his advocacy into a practical form, having adopted a mechanical street-sweeping system with the steam lorry of the Thornycroft type which is owned by his Borough Council. This vehicle has a 700-gallon water-tank, and by attaching a rotary sweeper behind the sprinkler is doing good service in cleansing the streets of Kensington. Should it prove as economical as it is efficient it will doubtless be adopted by other Councils in the west-end of London.

Acetylene Generators.

THE report of the Committee on Acetylene Generators has been issued as a Parliamentary paper with a covering report to the Home Secretary by the Chief Inspector of Explosives, Captain Thomson, who explains that in view of the extended use of acetylene, he considered it advisable to have the advantage of expert advice. On December 22nd, 1900, he requested the following gentlemen to form a committee, and to carry out tests:—Mr. C. Vernon Boys, F.R.S., Mr. Henry E. Jones, M.Inst.C.E., M.I.Mech.E., Professor Vivian B. Lewes, F.I.C., F.C.S., etc., Dr. Boverton Redwood, F.R.S.E., F.I.C., D.Sc., etc., Mr. Alfred Spencer, Public Control Department, L.C.C., and Mr. James Swinburne, M.Inst.C.E., with Captain M. B. Lloyd, Inspector of Explosives, as secretary. Out of the forty-six generators tested not one showed evidence of being otherwise than safe under the conditions of the test. However, Captain Thomson has reason to believe that more than one apparatus was withheld from being tested, and in one or two instances serious defects in design were remedied before a generator was submitted to the test. The Committee consider that in the selection of an acetylene generator, regard should be had to the following *desiderata*:—(1) Simplicity of action and design; (2) strength of construction; (3) high efficiency, as indicated by the yield of gas per pound of carbide; (4) low pressure in generator; and (5) facility of removal of the residue. The conditions which a generator should fulfil before it can be considered safe, are:—(1) The temperature in any part of the generator, when run at the *maximum* rate for which it is designed, for a prolonged period, should not exceed 130 deg. C. (2) The generator should have an efficiency of not less than 90 per cent., which, with carbide yielding five cubic feet per pound, would imply a yield of 4.5 cubic feet for each pound of carbide used. (3) The carbide should be completely decomposed in the apparatus, so that lime sludge discharged from the generator shall not be capable of generating more gas. (4) The pressure in any part of the apparatus, on the generator side of the holder, should not exceed that of twenty inches of water, and on the service side, or where no gas

holder is provided, should not exceed that of five inches of water. (5) The apparatus should give no tarry or other heavy condensation products from the decomposition of the carbide. (6) The air space in a generator before charging should be as small as possible. (7) The use of copper should be avoided in such parts of the apparatus as are liable to come in contact with acetylene.

Motor-Cars in Persia.

It will be remembered that as a result of his last visit to Europe, the Shah of Persia became so interested in automobilism that he ordered a Gardner-Serpellet steam car; a new one of the same type being subsequently purchased. We are this week able to reproduce two interesting photographs of the latter vehicle, which has now been in constant use since August, last year. The car reached Persia by way of Rescht, a port on the Caspian Sea, and was thence driven by road to Teheran; the journey of 210 miles, notwithstanding the hilly route and bad roads, being made in 15 hours and 20 minutes. The accom-

THE SHAH OF PERSIA'S GARDNER-SERPELLET STEAM-CAR AT KASWIN. *[La France Automobile.]*

panying illustration depicts the car in front of the post office at Kaswin, while the photograph given on page 39 shows the vehicle, *en route* to Teheran, in the bleak and hilly district of Karzan. We understand that as a result of his automobile experiences the Shah has given orders for the high road to the Persian capital to be put into suitable order for motor-car traffic.

Prejudice at Plymouth.

AN outbreak of prejudice against motor-cars seems to have occurred at Plymouth, where the successful running of a motor public service has apparently upset the owners of horse-drawn vehicles. A few weeks ago two constables were engaged for some days in timing the motor-vehicles used in the public service, with the result that one of the drivers was summoned for exceeding a speed of eight miles an hour. On the case going into Court it was shown that a speed of twelve miles an hour was allowed, and the summons had to be amended. Now we understand the same driver is being summoned for driving to the common danger of the public. Evidently the police are determined that, whatever happens, he shall not escape. A sad accident, which recently occurred in the town has also contributed

towards the present prejudice existing; but in this case the jury have shown more sense than the public, and have returned a verdict of "Accidental death," adding a rider, that there was not the slightest blame attached to the motor-car driver. Even this, however, we suppose will not satisfy everybody.

Taxing Motor-Cars.

A SHREWSBURY gentleman has been writing to the papers suggesting to the Chancellor of the Exchequer that "owners and users of motor-cars and traction engines should pay £2 or £3 for an annual licence in proportion to the number of persons to be carried." This proposal absolutely ignores the tax that is already required, and leads us to the suggestion that correspondents to newspapers, whose letters are based on ignorance, should either be taxed or warned by the police. People are always prone to make suggestions for the Chancellor of the Exchequer as Budget day draws near, and probably motor-cars will be kept well before his notice this year. But it should not be forgotten that these vehicles are already taxed, and that they are less destructive of the roads of the country than are horse-drawn vehicles.

Motor-Bicycle Construction.

AN American contemporary makes some strong remarks on the subject of motor-bicycles which are well worthy of reproduction. "Bicycles, as now designed and constructed, were," it states, "never intended to bear the weight and incessant vibration of a motor; so clear and logical is this that it is incomprehensible that the fact is not more generally recognised. It is not enough to merely use heavier tubing, either. The joints and connections are even more vital, and it is there that weight, lengths, and diameters, as well as methods of brazing and fastening, must be given attention. It is the sheerest folly to simply devise a means of conveniently locating a motor on the present-day bicycle, and then expect the bicycle to stand up for any length of time. It will not do it, and anyone who markets or purchases a motor-bicycle in such belief is doomed to trouble, expense, and disappointment, for which he himself is to blame."

Hints on Troubles Wanted.

OUR Correspondence columns contain a suggestive letter which we hope will be read by all our readers. We are always ready to welcome letters on the lines suggested by our medical friend, and there is no doubt that those who can supply useful hints as to how to obviate difficulties are rendering good service to the industry.

The Choice of Cars.

It is an undoubted fact, lamentable no doubt, but none the less true, that the majority of cars purchased in this country are of foreign manufacture, a state of affairs now and then drawn attention to by weak-kneed wails and accusations of lack of patriotism from those interested in home productions, but none the less deserving of careful consideration by all who have the welfare of British automobilism at heart. What then, it may be asked, determines the purchaser's choice of a car? In the case of the "old hand," it may generally be summarised as "reputation," a quality that may be acquired by a particular make by many years of good performance—which few British cars have yet had the opportunity to compass—or by some particularly successful public achievement, for which the chances in this country are painfully limited; while the numerous contests held on the Continent have enabled many manufacturers previously little known to leap into temporary and profitable popularity, without detriment to the older and well-established firms. In the case of the novice (and if automobilism grows at the rate we may expect and hope for he will be in a large majority), it is seldom that he does not get advice from more experienced friends, who have probably, from the nature of the case, graduated on

foreign cars. There is no doubt that the best English cars are at least equals in workmanship and durability to the foreign production; it is the fault of our manufacturers if they are not produced as cheaply; and, racing apart, they are as speedy as the ordinary user can require. But the facilities of determining which is the best are greater on the Continent than here, and the multiplication of trials, costly though it be, is the only way of hastening that survival of the fittest which otherwise time alone can effect, and which the publication of the makers' own opinion of their cars, in which some show such a pathetic faith, can do nothing to bring about.

A Sussex Service.

LAST week we were able to announce that it has been decided to institute a series of motor-car services to Rye, Hastings, and other places in the vicinity, from Northiam as a centre. There is no doubt that such a service, if economically managed and developed on enterprising lines, should be a great success. Not only are the roads eminently suited for motor-car traffic, but the many small pleasure resorts in the district should bring a sufficient number of visitors to secure a good paying passenger service. We hope, too, that the promoters of the venture will not overlook the possibilities that exist for goods traffic in that part of Sussex; and, bearing in mind what Mr. Hanbury has recently told the members of the Yorkshire Chamber of Agriculture, the farmers of Sussex should certainly look favourably on the new service.

POSITION IS EVERYTHING.

THE EVOLUTION OF THE RACER. [The Automobile Magazine.]

Motor-Cycles and Medicos.

MANY of the pioneers of automobilism have belonged to the medical profession, which has, as a body, shown a consistent and sustained interest in motor-car progress. A large number of those who, for various reasons, have not yet been converted are now being attracted within the charmed sphere by the motor-bicycle, and we have been somewhat surprised at the number of doctors making inquiries after this type of machine. It certainly has many claims on their attention. The country practitioner frequently does a proportion of his work by bicycle, and the substitution of a motor-bicycle is an inexpensive and instructive way of entering automobilism. Moreover, a trivial stoppage due to inexperience will not delay him as with a car or even a tricycle, as the removal of the belt will enable him to pedal his machine with no great difficulty, and postpone its diagnosis till a convenient season. The troubles of the novice, which

are peculiarly inconvenient to the medical man, will be reduced to a minimum, while the experience gained will be mostly applicable to the larger vehicle he will probably soon covet. It is true that the motor-bicycle is not a foul-weather machine; but it is, if of good design, as safe as an ordinary one in mud, if not driven faster than the latter would be under the same circumstances, and permits of carrying more wraps with impunity. If to be used on bad roads, it should carry its engine well out of the way of mud and grit, and a doctor, more than most purchasers, has reason to choose a substantial and well-tried design, and eschew "experiments," which are likely to be peculiarly numerous—not that this is other than most desirable—in this department of automobilism.

Land and Sea Trips.

ONE advantage of the motor-car over the horse-drawn carriage is that it can be made to accompany its owner on his holidays. And this advantage is not restricted to trips in our own country, for Lord and Lady Iveagh, who are yachting in the Mediterranean, have taken their motor-car with them on board their yacht, and make long excursions on it when they are in port for a day or two, anywhere. Here is a combination of land and sea pleasures which would be impossible with any other vehicle than an automobile.

The Ignition Question in America.

AN American writer, dealing with the subject of ignition, remarks that tube ignition, which never was common in the United States, has dropped out of sight altogether. There is also a strong tendency to abandon the use of batteries and substitute dynamos and magnets for ignition purposes on petrol motors. Winton uses a dynamo operated by a round belt from the same shaft that drives the water-circulating pump, using a set of batteries only as an auxiliary to start the motor. Haynes-Apperson, Robinson, and Duryea use a magneto—the two first-named employing, like Winton, a battery as a starter; Duryea, however, does not, using instead a naked copper wire to carry the current until it wears out—insulation not troubling him.

Testimonials.

DIVERSE and frequently peculiar are the points of excellence which are brought out prominently by those who write testimonials with regard to motor-vehicles. Not long ago an agent suggested to a gentleman who had purchased a car that he might possibly, if he were satisfied, be willing to send a line expressing his pleasure, so that it could be used to attract other customers. Agreeably to promise the purchaser sent a testimonial as follows:—"Six months ago I bought one of your famous motor-vehicles. I have since had no less than twelve convictions for speeds ranging from forty to ninety miles an hour. I can produce sworn testimony as to the extraordinary speed powers of the carriage if desired." Although so fully convincing as to the capabilities of the particular car, this testimonial has not yet been exhibited in the depot window of the motor agent.

Imitation.

MANY people seem inclined to discuss at length the imitative qualities of other persons and other nations. Undoubtedly there is a good deal of watchfulness in certain trades in order to imitate good ideas and adopt new notions, but it must not be forgotten that simultaneous discovery is not unknown, and it has often happened that inventors in different countries have hit upon the same plans, and brought out identical improvements contemporaneously. With regard to the morality of imitation in connection with motor-car work it must not be forgotten that the great aim of manufacturers is to produce a perfect car, and whether

that desideratum is produced in France, England, or elsewhere is hardly a matter of concern. French cars have been popular here because of the good ideas which have been embodied therein; but now that British manufacturers are advancing so rapidly an export trade is not an impossibility. People want the best they can get. If it is of English manufacture we shall naturally favour it, but still we want the best, and the only regret is that English regulations have not yet afforded much encouragement to our makers. Hence the necessity for urging the withdrawal of the present restrictions.

Club Gossip.

LORD SUFFIELD will entertain the owners of cars entered for the speed trial at Gunton Park, Cromer, on Saturday, the 29th inst., at luncheon. Among those who have already intimated their intention of driving over the mile course are Messrs. A. F. Bird on his 24-h.p. Mors, J. M. Gorham on his De Dion voiturette, J. E. Hutton on his 10-h.p. Panhard, and S. F. Edge on his 50-h.p. Napier. A Committee of the Club is now considering a suggestion with regard to the training of suitable men to become motor-servants. The next dinner of the Club will be held at the Agricultural Hall on Wednesday, April 23rd, at 7 p.m.

THE annual meeting of the Motor Union will be held at the Exhibition at the Agricultural Hall, on Wednesday, April 23rd, at 3 p.m.

TO-DAY (Saturday) Mr. O. E. Bush sails in the *Scot* for Capetown with two Panhard cars, of 10 and 12 h.p. respectively, for Mr. Cecil Rhodes.

ON Wednesday, at Birmingham, S. Wright won a five miles motor-bicycle handicap on an Excelsior machine. His actual riding time was 8 min. 34 secs.

A *Course du Kilometre* is being organised by the Automobile Club of Antwerp. It will be run off on the 24th April, and will be open to motor-cycles and cars.

SHORTLY after Easter, a conference of the hon. secretaries of the various centres of the Automobile Club will be held to arrange for a Whitsuntide tour, probably in the Derbyshire district.

ON Saturday, April 5th, a trial of motor-cycles will be held, under the auspices of the Automobile Club and the Cyclists' Touring Club, at the Crystal Palace. On behalf of the former organisation the new Motor-cycle Committee of the Club is making the necessary arrangements. This Committee consists of the Rev. Arundel Whatton, Professor Vernon Boys, Col. Holden, Messrs. Shipton, Jarrott, S. F. Edge, Pennell, C. A. Smith, Todd, O'Gorman, and Campbell Swinton.

ON Wednesday, W. Brandon was summoned at the Marlborough Street police-court for causing an obstruction to traffic by leaving a motor carriage outside the Trocadero Restaurant on the previous night. Defendant denied all knowledge of the vehicle, and declared that at the time of the alleged offence he was at the Lyceum Theatre. On the other hand, a constable said that the defendant came out of the restaurant, and admitted that although the carriage was not his property, he had been driving it. At his own request, the defendant was remanded on his own recognisances in £10.

THE English opera season of 1902 will commence on May 8th, and there will be sixty-seven performances. The list of subscribers will probably exceed any previous records, and it is very likely that motor-carriages will be well represented in the vehicles which will be found nightly in the vicinity of Covent Garden. In a preliminary list of those to whom boxes and stalls have already been allotted the names of many motorists appear, including the Countess de Grey, Mrs. Arthur Paget, Mr. Paris Singer, Mr. Alfred de Rothschild, Mr. W. S. M. Burns, Mr. A. Harmsworth, and others. Madame Melba, the principal soprano engaged, is the owner of an electrical vehicle. The forthcoming opera season may do much to further the cause of automobilism among society people if a few of those who have been mentioned will use their motor-carriages in going to and from the opera-house.

CONTINENTAL NOTES.

By "AUTOMAN."

THE opening of the automobile racing season is fast approaching, and the attention of those *chauffeurs* who take an interest in the public competitions is being centred on the "Semaine de Nice," which has now assumed the proportions of a classic event. To add to the general interest, the Nice-Abbazia-Nice race starts by crossing the Alps and subsequently traverses perhaps the most historically interesting country in Europe to reach a new winter resort on the Adriatic Sea. The Nice week opens on Sunday, April 6th, with a battle of flowers in the public gardens of Nice, when the best-decorated motor-cars will receive commemorative banners. On the following day the real contest begins with the hill-climbing trial from Nice to La Turbie, over a course about $9\frac{1}{2}$ miles long on the mountain road between Nice and Monte Carlo. After the competition there will be a *concours d'elegance* in front of the Casino at Monte Carlo, and a distribution of prizes in the shape of medals and *objets d'art*.

ON Tuesday, at 5 a.m., the Nice-Abbazia-Nice road race will begin. It is over a total distance of 1,182 miles, out of which 834 miles are at racing speed, and the remainder over neutral areas, neutralised owing to the nationality of the country traversed (French and Austrian soil), and also owing to the *agglomerations* and dangers to be encountered on the road. The first stage of the race is from Nice to Turin (141 miles), through Monaco, Vintimille, and Breil, up the southern slopes of the Alps, over the Col de Tende Pass, and down the northern side through Limone to Coni. Thus far there will be no racing, it being neutralised soil, over which touring speed only will be allowed.

Chauffeurs will have the opportunity of remarking the extraordinary difference between the southern and northern slopes of the Alps, the former dry and in the beauty of springtime verdure, the latter covered with the deep snows of winter. At Coni, on the plains below, the racing commences at 2 p.m. (central European time), and from thence through Saluces, Cavour, Piquerol, and Orbassano, to Turin, over flat, broad, hard roads, where any speed may be indulged in without danger, except about 25 miles from Turin, where the roads become very bad in every way. They are covered either with mud or dust, according as the weather is wet or dry, to the depth of six or eight inches, and traversed continually by deep ditches. The second stage starts from Turin on Wednesday morning at 6 a.m., and passes through Asti, Alexandria, Tortona, Voghera, Plaisance, Cremona, Mantua, and ends at Verona, altogether 203 miles, of which the first sixty are simply awful; after that they improve gradually as the home of Stradivarius is approached, and the improvement continues towards the haunts of the Montagues and the Capulets, made sacred to every Englishman who loves his Shakespeare.

ON the third day the stage is short, only 75 miles, starting from Verona at 6 a.m., and passing through Vicenza and Padua

to Mestre, which is the nearest point to Venice. A few miles by rail will take the *chauffeurs* to the city of the Doges, where they will pass the night, and no doubt disport themselves on the Grand Canal in gondolas, and visit the Place St. Marc and the Bridge of Sighs, or talk petrol with the merchants of Venice on the Rialto. On the fourth day the race will start at 6 a.m., and will continue as far as Udine on the Austrian frontier, 79 miles on good roads; from thence to Abbazia, on Austrian soil, the route is neutralised, 96 miles. Saturday and Sunday, April 12th and 13th, are to be spent in *fetes* at Abbazia and Fiume, which will be organised under the patronage of Count Szapary.

MONDAY, Tuesday, Wednesday, and Thursday will be spent on the return journey over the same course, and in the same stages as on the outward journey. On the Friday and Saturday there will be an exhibition at Nice, held in the garage of the Automobile Club of Nice, 5, Boulevard Gambetta, where all competing vehicles, both in the racing and touring sections, must be exhibited. On Sunday, April 20th, the Nice races will be brought to a close by the mile race on the cemented pavement of the Promenade des Anglais for the Rothschild Cup, and attempts to break existing records. Léon Serpollet at present holds the cup with a record of 35½ secs.

THE SHAH OF PERSIA'S GARDNER-SERPOLLET STEAM CAR EN ROUTE TO TEHERAN.
(See Page 36.)

AMONGST the changes in the racing rules which came into effect on January 1st, by order of the A.C.F., the most important is, of course, the limit of weight to one ton, the wisdom of which will very soon be tested. I was always strongly in favour of this restriction, and I venture to predict that it will mark the beginning of more startling changes and improvements in the automobile that even the most sanguine partisans could have imagined; and I wish I were quite convinced by the criticism my articles have evoked on the question of English

v. French makers that the former have sufficiently studied the question, and applied themselves effectively to the reduction of useless weight. I had occasion the other day to examine the new 15 h.p. light Panhard, which scales just 18½ cwt., ready for the road, and with oil and water tanks full. The engine gives fully 22 h.p. on the brake.

THERE is another new rule for racing which will bring out certain desirable points, and that is the complete suppression of time allowed for repairs. On the old plan, on arrival at the "parc," where the cars were placed for the night, a store of outer-covers was always awaiting the *chauffeurs*, and as a change of covers cost nothing to the *chauffeur*, and did not lose him any time, most of the fast cars had new tyres every day, whether they needed them or not, and it became impossible to register the life of a tyre. Now, however, the change of a tyre will mean at least fifteen minutes' delay, and every *chauffeur* will hesitate before he loses fifteen minutes, and will therefore not change his tyres except when absolutely necessary, as each change of the four wheels would mean nearly an hour lost. It will, therefore, now be possible to have tyres marked and controlled, and to know which tyre stands the best, and by this means the tyre-makers will be stirred to further efforts in this direction,

THE last week in Paris has been ideal motoring weather, and the number of cars to be seen in every direction begins to open the eyes of the unbelievers in the new form of locomotion, and bring before them the day—not far distant, I hope—when the Paris cab-horse becomes a thing of history; for if any animal in the world wants suppressing and replacing by a machine it is the poor Paris cab-horse, whose ribs are more apparent than his breeding, and who has to stagger on often under a load of people and luggage quite beyond his safe load, and beyond certainly his will, unless stimulated by the "Hen Cocotte" and the accompanying brutal lash of the whip. I notice by the side of the Opera the Peugeot cabs are out again, but most remarkable is the increase in the number of high-class electrical broughams. Decidedly, to be *chic* in Paris now, one must have an electric brougham. The other day I ran across Mr. Rucker at the A.C.F., in search of information with regard to the distance between Paris and Brussels, and of a car to hire for a trip there.

LONGUEMARE CARBURETTOR FOR BICYCLE MOTORS.

A SMALL size of carburettor suitable for bicycle motors of from 1 to 2 h.p. has recently been placed upon the market by the Longuemare firm, of Paris. In this the float and constant level mechanism have been done away with and the size and weight have thereby been greatly reduced. The body of the carburettor is approximately cylindrical in form. The air

arrives through a pipe H joined to the carburettor on one side and the petrol through a small tube F on the opposite side. The petrol flows through a hand-operated needle valve, along a winding passage and a series of small apertures into the mixing passage. Here the mixture is formed, which leaves the carburettor through a pipe G connected to it on top.

AN automobile exhibition will be held in January at Madison Square Garden, New York.

LAST week a fatal accident occurred in Reading as the result of a horse running away, and in its flight knocking over a cyclist, the rider sustaining such injuries that he died shortly after his admission to the hospital. An eye-witness of the scene tells us of the escape of half a dozen other cyclists.

THE Albion Battery Company, Limited, has been registered with a capital of £25,000, to acquire from Messrs. C. Tunstill, J. Opperman, George Fowler, and R. G. Margetson certain inventions in regard to accumulators, to develop the same, and to carry on business as electrical and mechanical engineers.

BEFORE the members of the Nottingham Automobile Club, Mr. H. W. Staner has read the paper on steam-cars with which he recently favoured the Automobile Club in Whitehall, S.W. Mr. E. W. Wells presided over the meeting, and a vote of thanks was accorded the lecturer on the motion of Mr. A. R. Atkey, the hon. secretary.

THE CARE AND MAINTENANCE OF ACETYLENE LAMPS.

ACETYLENE lamps are regarded by most automobilists in the light of a necessary evil; yet, being practically indispensable, if driving at night is to be enjoyed with safety, any precautions to minimise the trouble they occasion are worth taking. And it may as well be admitted at once that the first and principal condition on which an acetylene lamp will consent to work is cleanliness, and unless it is suitably attended to after (rather than *before*) every period of use, trouble is likely to ensue. There are, however, lamps and lamps, and the principal sources of disorder in them may be separately considered, most of these being far more evident in small lamps than in large ones.

In the first place, the burner has necessarily a very small aperture, and is therefore very liable to obstruction, the materials for which are plentifully provided by many systems of generation. This may be conveniently cleaned by the fine hard brass wires sold for hypodermic syringes, while the larger bore often terminating the jet should be cleaned out by a drill that fits it. Air apertures in the burner, if present—for some of the best jets act on the principle of a miniature pair of Bunsens—equally require to be kept free from obstruction. This clogging of the burner occurs to a very variable extent with different lamps, several causes contributing to it. First, the reaction between calcium carbide and water generates heat, often sufficient to cause polymerisation of the gas, with consequent production of benzene and similar compounds. Some of these are of a tarry nature, causing an adhesive deposit in the burner. Generators like the Bleriot, in which the water rises and falls round the carbide according to the consumption of the gas, would be liable to this, were it not avoided by the use of the so-called "acetylithe," which is a calcium carbide made partially "waterproof" by treatment with some water-repelling material. Hence it is comparatively unaffected by the moist atmosphere inside the apparatus, unless directly in contact with water. The action is thus rendered more gradual, and the liability to overheat diminished; at the cost, of course, of requiring a specially prepared carbide not so universally obtainable. Soaking ordinary carbide in heavy paraffin oil has a similar effect, but is apt to mess up the generator.

Next, the action is always accompanied by the production of lime, some of which, especially in "drip" generators, is carried over with the gas in the form of a fine powder, which would rapidly choke the burner were it not filtered out. The filter for this purpose, usually a pad of cotton-wool in a tube or chamber, requires occasional renewal. This pad also serves to retain moisture, unless there is a special carbide filter for this purpose. If a lamp of the "drip" type is allowed to burn itself out, the pad will probably get wetted, and cease to work. Few lamps will bear turning down much without smoking and consequent clogging, and hence, if the generator works unevenly and there is no rubber bag to equalise the pressure, the effect is similar, and troubles occur. If a burner has once got thoroughly dirty it seems to have a great tendency to do so again after cleaning, possibly owing to the material of the jet absorbing some of the tarry products, and it is best in such cases to substitute a new one. There are not many lamps that will burn well after being turned out for some time, without recharging; as the used portion of the charge—in addition to retaining moisture often sufficient to decompose the unused part during disuse—also shields the latter from the water when turned on. It is often an advantage with such lamps to intersperse a few strips of porous material—such as blotting-paper—with the charge, but, except with the lamps using "acetylithe," it is always advisable to clean them out after every time of use. With "drip" generators the used charge is apt to become hard and difficult to remove, unless this is done while a partially used charge of ordinary carbide continues to give off gas which acts by no means beneficially on the brass parts of the apparatus. For this reason, and also on account of gritty lime particles, the taps of lamps are very apt to become leaky, unless well greased. It is always advantageous that the

passage from generator to burner should be as long and tortuous as possible, thus assisting the gas to deposit impurities; and with some of the smaller lamps that have a rubber connection between the two, improvement will follow the substitution of a longer piece of tube.

A point that should not be forgotten is that carbide expands very considerably during decomposition, and generators must therefore not be over-filled. Where there is any likelihood of recharging being necessary during a drive, it should be attended to before the old charge has got thoroughly wet, and the flame begins to fall off. At this stage the used charge can be shaken out in a fairly dry state; but if it is soaked, the insertion of the new one into the damp generator will be a wasteful and aromatic process. It does not appear that the smell of acetylene is particularly deleterious as compared, for instance, with house gas; but it has an undoubted effect with some constitutions in producing headache, and it is advisable to see that all joints of the generator are gas-tight. This can be generally ensured by smearing them with vaseline before screwing up, though rubber packings are not improved by this. It is, however, not easy at times to get a gas-tight joint with dry rubber, the more so as it is generally covered with lime powder from the charge. When frost is feared, brine can be substituted for water in the lamp, but it should be made, if possible, from pure sodium chloride, free from magnesium chloride, the latter acting on metals, and being often present in common salt. Acetylene lamps, as most users of them find, require some trouble to keep in order; but this is reduced to a minimum if taken immediately after every time of using.

R. W. BUTTEMER.

A COMPANY has just been formed in Brussels with a capital of £24,000 to be known as La Compagnie des Vehicules Electriques et des Equipages de Luxe.

A COMBINATION lifting jack and tire-pump for motor-cars has been introduced by Messrs. Schmidt and Mueller, of Winnebago Street, Milwaukee, U.S.A. The jack or pump is available for use either singly or together. In case of a puncture the vehicle can be lifted, and by the turning of a pin in the centre of the lever the pump may be released from the jack, the latter being held in place by a clutch at the top of the frame.

THE use of motor-cars is spreading very rapidly in Italy, writes the British Consul at Naples. The country is well adapted for their use, as the roads are excellent, and, where mountainous, the gradients are arranged with consummate skill. The use of automobiles for military purposes is attracting attention, and there can be no doubt that in the near future there will be a large trade in them, the only drawback being the high price of petrol in Italy. At present the business appears to be, for the most part, in the hands of French manufacturers.

M. E. FREMY, of 43, Boulevard du Hainaut, Brussels, has sent us a sample of the latest pattern of the "Stéate" sparking plug. As hitherto, a noticeable feature of this plug is the use of the mineral steatite in place of porcelain. Among the advantages claimed for it are that after being baked in a furnace at a high temperature its mechanical and electrical resistance greatly increases, and is much in excess of that of porcelain. A new departure in connection with the plug is somewhat difficult to describe without an illustration. We may say, however, that instead of the sparking taking place between two points, it occurs between a central point and the edges of a small hole in a disc of nickel. The end of the screw-threaded steel portion of the plug is ground flat, and on this is fixed a disc of nickel; a long rod passes through the centre of the plug and terminates flush with the disc, there being a space of from $\frac{1}{32}$ to $\frac{1}{16}$ in. between the conical point of the rod and the disc. It is claimed for the arrangement that small deposits of carbon will not interfere with the working of the plug, for if the current cannot find a passage from the end of the rod to the disc at one point, it jumps across another. The plug is put together without any cement being used, and, so far as we can judge from the short trial we have given it, appears to work very well.

THE MICHELIN NAIL EXTRACTOR FOR PNEUMATIC TYRES.

FOR a long time many cyclists have adopted the plan of stretching a piece of wire just clear of the surface of the tyre across the back stays, in order to whisk out any thorns that have partly entered into the tyre. On a much enlarged scale this notion is embodied in a nail-catcher for the tyres of motor-cars that has lately been introduced by Messrs. Michelin, the well-known tyre makers, and a working example of its action was on view during the recent Paris Show. It consists of a sort of light shoe or spoon, pivoted on its lower end to an arm

and bolted to the body of the car. The spoons are held so as to lightly bear against the tyres of the rear wheels by means of rubber bands *D*, which are hooked to bolts *F*, fixed to the mudguards *H*. The rubber band is provided with an adjusting rod *E*. Any obstruction rising with the tyre catches the edge of the spoon, and if the first edge does not dislodge it the chances are that one of the others will. Tyres being thick in the tread, a nail usually requires the repeated hammerings of several revolutions to be forced right in; hence the value of this nail-catcher as a method of dislodging the injurious object when it has only had its first blow, and has therefore only begun to feel its way into the interior of the tire. It is said that this simple little device serves its purpose admirably, some automobilists in France using it having run over 2,000 miles without a puncture.

THE Continental Caoutchouc and Gutta-percha Company have made arrangements with the Clipper Pneumatic Tyre Company for the sale by the latter concern of Continental motor inner-tubes, and all rubber goods manufactured by them for the motor trade. Motor tyres made by the Continental Company at their Hanover works will be known here as "Clipper-Continental motor tyres."

VOGT MOTORS, LIMITED, is the title of a company registered with a capital of £40,000, to adopt an agreement with A. Vogt, M. von Recklinghausen, P. Rottenberg, H. Allan, J. A. Allan, R. M. Paterson, L. Rottenberg, W. A. Donaldson, A. S. McGlelland, R. Cassels, Dr. L. Mond, W. Field, Dr. H. Gerlich, J. Bachman, and to carry on the general business of builders of motors, motor-cars and cycles of every description.

WE have received a price list in connection with the "Falconnet" Compound tyre. In this type the edge of the rim is of such section that in the event of sudden strain the possibility of cutting the tyre is obviated. In fact it is claimed that the tyre has additional support in such a case. When fitted into its place on the rim the tyre is also secured by a system of safety lock-bolts, and the operation further completed by the tyre being cemented, thus preventing creeping. The "Falconnet" Compound tyres are made at Choisy-le-Roi, near Paris, and supplied from the Paris depot at 6, Avenue Percier.

D

The De Dion Light Car.

THE new De Dion light car, with the engine in front, is a vehicle which is just now attracting considerable attention. Some time ago we published a brief description of its main features, and an illustration showing its general appearance; but the new car is such a radical departure from the De Dion voiturette that a more complete explanation of the arrangement may be useful. To this end we spent some time the other day in inspecting a chassis at the depot at Brook Street, W., of De Dion-Bouton, Limited, and are now able to publish some further illustrations (Figs. 1 to 6) which will greatly elucidate the text. To begin with the frame, this, as will be seen from Fig. 1, below, is of weldless steel tubing, strongly stayed

carburettor, which furnishes the explosive mixture, is on practically the same lines as that used in the $4\frac{1}{2}$ -h.p. De Dion voiturette. The water circulation is maintained by a centrifugal pump of new design. Fig. 4 is a view of the pump with the plate swung back to show the interior arrangement. The water enters at *n*, and is discharged at *m*. In the first vehicles, as shown in Fig. 1, the pump was located near the motor and driven by a friction wheel, but in the latest cars it is placed near, and driven by worm gearing off the variable speed gear. To assist the cooling of the heated water, a large radiating coil is suspended from the

FIG. 1.—PLAN OF DE DION 8 H.P. LIGHT CAR.

and supported on the axles by springs. The motive power is supplied by an 8-h.p. single-cylinder vertical motor placed forward under a bonnet. A smart dashboard is fitted in front of the driver, to the inside of which a large petrol tank, having a capacity of four gallons, is attached. Upon the other side, that is, underneath the bonnet, a water tank is fitted, with the induction coil alongside. The bonnet lifts up, being hinged upon the dashboard, a metal stay being provided to keep it up-lifted whilst examining the motor or its parts. The float-feed

FIG. 2.—SIDE ELEVATION OF DE DION LIGHT CAR.

front end of the frame. Another small point of interest is the suppression of the ordinary compression cock, its place being taken by a plunger fitted to the inlet-valve, by means of which the latter can be held open to ease the compression at starting.

Two speeds forward and reverse motion are provided, the

FIG. 3.—FRONT ELEVATION OF DE DION LIGHT CAR.

power of the motor being transmitted through a longitudinal shaft, with universal joints, to the gear-box at the rear, and from the gear-box by bevel pinions to the differential gear on the rear axle. One of the principal features of the car is the change-speed gear (Figs. 5 and 6). The principle is the same as on the $4\frac{1}{2}$ -h.p.

voiturette, but it has undergone considerable modification, having been enlarged and strengthened. The reversing gear is placed in the same gear-box as the speed-changing device, and a peculiar mechanical action has resulted. When the reverse motion is put in gear, from a small handle under the driver's seat, the speed-changing handle can be brought into requisition to drive backwards. Almost before coming to an absolute stop the change-speed handle can be pushed forward, as for top speed, and the car will immediately drive forward. The advantage

FIG. 4.—VIEW OF DE DION WATER-CIRCULATING PUMP.

claimed for the arrangement is that when it is required to reverse, the car can instantly be driven forward again without it being necessary to replace the reversing gear into its usual position.

The speed-changing gear is on the friction principle, with no toothed wheels to move in and out of gear. As the change-speed handle under the steering wheel, upon the left-hand side of the upright tubes, is pulled towards the driver for the slow speed, a rack working a small pinion in the centre of the speed-changing gear causes the diameter of the fibre segments to increase, and thus lock the low-gear segments against the inner surface of the friction case, causing the gear to drive. At the same time, the pinion decreases the diameter of the opposite segments, and thus releases the high gear, and *vice versa*. When the handle is placed in a central position both the gears are thrown out and the motor continues running, but is disconnected from the transmission mechanism. The speed-changing and

FIG. 5.—VIEW OF DE DION CHANGE-SPEED GEAR BOX AND BEVEL GEAR CONNECTION TO REAR AXLE.

differential gears are contained in two well-finished aluminium cases bolted together. With the variable sparking device the speed of the motor, and consequently that of the car, can be increased or decreased as desired. Thus it will be seen that with the variable sparking and the exhaust valve-lifter, combined with the two-speed gear, any speed can be obtained from zero up to thirty miles per hour. The rear axle is of the well-known De Dion *cardan*, or universally-jointed type, which

enables it to rise and fall with great freedom in sympathy with the springs, so reducing to a minimum the vibration transmitted to the driver and passengers.

Irreversible inclined wheel steering is adopted, two vertical tubes serving to keep the steering column firmly in its position. Upon the left-hand vertical tube B (Fig. 3) the speed-changing handle is fitted, and upon the right-hand tube, on the top, C is the advance-sparking lever, and immediately underneath is the lever D, to regulate the carburation. A useful feature is the exhaust-valve closer or throttle, which can be actuated by hand from the right side of the dashboard like an accelerator, and also in connection with the brake-pedal. The first effect on depressing the latter is to act on the exhaust valve, keeping it closed, and so slow down the motor and reduce the noise, an advantage when riding through crowded thoroughfares. A further depression of the pedal brings into operation a powerful double-claw brake, placed at the forward end of the speed-gear case upon the second shaft running through to the differential gear. A hand lever, fitted to the right side of the driver's seat, actuates band brakes over drums attached to the hubs of each of the rear road wheels. The brakes are very powerful, and act either forward or backward. Wooden wheels of equal diameter (24½ in.) are fitted, and these are shod with 85 mm. pneumatic tires. The question of lubrication of the working parts has been well attended to, a lubricator with four-way cock being fitted on the dashboard. The

FIG. 6.—SECTION THROUGH DE DION CHANGE-SPEED GEAR BOX.

wheel base of the car is 5 ft. 7½ in. by 3 ft. 10¼ in., the vehicle complete weighing a little over 10 cwt. The motor and transmission gear being supported entirely on the frame, any type of carriage body—tonneau, phaeton, limousine, etc.—can be fitted; a department to which Messrs. De Dion-Bouton, Limited, are paying great attention.

A NEW booklet explanatory of the Ormonde motor-bicycles has been issued by the Ormonde Motor Company, of Wells Street, Oxford Street, W., who are the sole agents for the United Kingdom for the "Kelecom" motors for bicycles. Accompanying the booklet is a price list of motor and frame fittings, etc.

THE Manchester Motor Transport Company, Limited, has this week closed the list of applications for share capital. It is being formed with a capital of £20,000 and carrying by means of motor vehicles will be undertaken in the districts to the North, East and South of Manchester. It is hoped that considerable business will result from the carriage of milk from the more remote parts of Mid-Cheshire, and by the collection, storage and sale of eggs. According to the prospectus the directors have six steam lorries on order, and have secured the sole agency for Manchester and a district of twenty miles round for the "Milwaukee" steam car and "Still" electric car.

THE "VULCAN" VOITURETTE.

WE are this week able to give an illustration of the Vulcan voiturette, which made its *début* at the recent cycle and motor show in Liverpool. The frame, as will be seen, is of tubular construction, supported on the axles by long springs. The motive power is supplied by a single cylinder motor, 90 mm. bore by 90 mm. stroke, developing 4 h.p. Electrical ignition with positive contact is employed, the trembler being fitted on the induction coil. The cylinder is water cooled, the circulation being maintained on the thermo-siphon system, no pump being used. Two speeds, eight and eighteen miles an hour, are provided, the power of the engine being transmitted by a single belt working on fast and loose pulleys to a counter-shaft, and thence by gear wheels to the rear axle. Provision is made whereby any slack of the belt may be taken up without it being necessary for the driver to dismount. Steering is controlled by an inclined hand-wheel, on the column of which the gas, air, and speed-changing levers are grouped. Two brakes are fitted, while the cycle-type road wheels are all 26 inches in

THE "VULCAN" VOITURETTE.

diameter, shod with $2\frac{1}{2}$ in. pneumatic tires. The little car measures 7ft. by 4 ft. 4 in. over all, and weighs about $5\frac{1}{2}$ cwt. The makers—the Vulcan Motor and Engineering Company, of Yellow House Lane, Southport—inform us that their object has been to build a light, simple, and yet strong car with an engine of ample power. This latter quality was fully tested on the car's return journey from Liverpool to Southport, a distance of twenty-one miles. The roads were six inches deep in snow and full of frozen cart ruts, yet the car travelled the full journey using only the top speed, the motor being throttled down when required.

ACCORDING to the leading newspapers of India, the motor-car is putting in an appearance in Calcutta, Madras, and other chief cities of the Dependency, while a gentleman well-known in Assam has imported several Locomobiles for use in India. Mr. A. M. Grose, late pupil of Messrs. Frank F. Wellington, Ltd., has sailed for India to take up a position as chief engineer to a large transport company, who intend running steam cars for passengers, mails, and goods.

EXPERIENCE WITH MOTOR-BICYCLES.

MY experience of motor-bicycles, which extends over about a year and a half, is practically confined to two makes, (1) being a machine supplied to me by Messrs. Luthi and Zurcher, of Neuchatel, who were the original inventors of the type of machine that now goes by the name of "Minerva," "Excelsior," etc.; (2) a Werner motor-bicycle, of the form with the engine placed in front of the handle-bar.

The chief defects that I have found with the Luthi and Zurcher machine are as follows:—The power, which is stated to be 1 h.p., is insufficient to climb even ordinary hills without assistance by the pedals. When in good order, however, the bicycle will go about twenty miles an hour on the level, and the amount of assistance necessary to enable it to climb hills is not very great. The exhaust and inlet valves are both too small, particularly the former, which consequently is very apt to get burned, and requires constant grinding in; the inlet valve also is liable to get overheated, which makes it stick. There is a great deal of leakage of oil, which comes out at the engine bearings; this gets on to

the belt, and makes the latter slip, while it also gets on to the trembler, and prevents it from making a proper contact. This leakage is, I think, due to the bearings being made too narrow, in order to get the engine to fit in between the cranks of ordinary "spread." Owing to oil on the belt, the latter has to be made very tight to prevent slipping, with the result that the fastenings tear out. The position of the engine in front of the bottom bracket leads to its getting very dirty, while if a wide mudguard is used on the front wheel, to avoid the dirt being thrown up on to the engine, the latter is apt to get over-heated, owing to the mudguard preventing the wind from blowing on to it. The compression tap is of a form that is very apt to stick, and also to leak. The handles for controlling the apparatus are not very conveniently placed. They are much better arranged on the handle bar, as in the case of the Werner machine. The form of surface carburettor employed is very liable to be affected by jolts. The fine wire gauze on the air-admission tap is apt to get blocked up with the dust, with the result that sufficient air does not pass. I believe that most of these defects have been remedied in later machines.

The engine of the Werner machine, which is supposed to

be of $1\frac{1}{2}$ h.p., will take the bicycle up any ordinary hill without assistance, and one can travel about thirty miles an hour on the level. The position of the engine in front of the handle-bar keeps it clean, and conduces to it being kept cool, as it encounters the full force of the wind. I have had no trouble with the valves or trembler of this machine, all of which are on a considerably larger scale than those of the one above referred to; nor is there any trouble in the Werner with oil leakage. I, however, find that the belts are very apt to stretch when new, and to crack when they have done stretching. Putting a little vegetable oil upon them seems to help to stop the cracking. The handles for controlling the mechanism on the Werner are, on the whole, very conveniently situated, though the one that controls the supply of air is somewhat clumsy, and one cannot leave go of it for an instant, as it moves its position with the vibration. My machine was originally fitted with a surface carburettor, which has the defect of being easily affected by jolts; but I have recently substituted a jet carburettor, which appears to be very fairly free from this defect. I think it is a mistake that the induction coil is exposed to the weather, and not enclosed in the same box as the battery. The front tyre, though originally corrugated, has worn entirely smooth; this appears to be due to the weight of the engine on the front wheel, and to the tyre slipping on the road under the impulses of the engine, and when it meets an uneven surface. The back tyre shows no wear of this description. The fact that the engine is attached to the handle-bar does not appear materially to add to the vibration of the latter, but the machine is somewhat stiff to steer, and great care is required in turning sharp corners.

Both the types of motor-bicycles mentioned above are undoubtedly liable to sideslip, but I have not noticed that there is anything very much to choose between them in this respect, although in the one case the engine is high up and in the other case it is low down. In the Luthi and Zurcher machine it is the back wheel, and in the Werner the front wheel that usually slips first. That is to say, it is always the driving wheel that is apt to slip. As long as the roads are dry they are very easy to manage and to control, but, however careful and experienced may be the rider, I do not think they are really safe to ride in traffic on wood, or especially on asphalt, which is in a greasy condition. Both machines, as originally supplied, were, I think, defective in not having sufficient capacity for petrol, this only amounting to about fifty miles, whereas to my ideas, the capacity should certainly not be less than 100 miles. In the case of the Luthi and Zurcher machine I have added an additional tank, so arranged that, by blowing air into this tank with the bicycle tyre pump, the petrol can be made to flow into the working tank. In this way I have increased the capacity to 120 miles, but I do not see why the original tank should not have been larger, and, of course, two small tanks must weigh more for the same capacity than one large one.

I think the weight of motor-bicycles is a matter of great importance. Each of the machines mentioned above weigh between 70 and 80 lbs., and this is a weight which one can, unassisted, carry upstairs, lift over obstacles, or place in railway trains, etc. With any considerably greater weight, however, one could not do these things, and this is, in my opinion, a considerable bar to the utility of the Singer bicycle, which, I believe, weighs about 120 lbs., or of the Holden bicycle, which, I understand, weighs 160 lbs. Indeed, the chief advantage of the motor-bicycle over the motor-tricycle and small cars is done away with if the weight exceeds what one man can lift. In the case of the Werner the engine is very noisy. I think this could be improved by having a larger silencer. Under certain circumstances explosions in the silencer are also very apt to occur, which is a troublesome feature.

I believe many persons have a difficulty with the ignition, and personally I had considerable trouble in this respect with the Luthi and Zurcher machine, so long as I used dry batteries. As soon, however, as I substituted for these a two-cell storage battery of reasonable size my difficulties disappeared. No doubt, in many cases, loose electrical connections, bad contacts, short circuits,

and allowing the storage battery to run down, may give trouble, particularly to those who are not used to electrical apparatus. The platinum contact pieces on the trembler as usually supplied are very small and thin, and quickly wear out. In my case, I have put on contact pieces nearly one-eighth of an inch thick, and since then have had no trouble with them. It must be borne in mind that with engines as small as those used on motor-bicycles the matter of getting a good compression is of great importance, while at the same time comparatively small air leaks, which would not materially affect a larger engine, have great influence in making the compression bad. It is therefore of special importance to see that all joints are made tight, and that the valves are properly ground in; this specially affects the power of the engine to take the bicycle uphill, as it is at low speeds that air leakages have most effect in reducing the compression.

Generally I may say that, in my opinion, the motor-bicycle has come to stay, and that it will be found to afford much amusement and to be of considerable utility to many who cannot afford to pay the price of a motor-car, or to find space for housing anything more bulky than a bicycle.

To others, again, the possession of a motor-bicycle will be the prelude to obtaining a motor-car, and to these the experience of internal combustion engines economically attained with the former will be found of great value when the more costly article comes to be worked. In fact, the motor-bicycle, while remaining the poor man's motor-carriage, will also serve as a means of education to the rich.

A. A. C. SWINTON.

THE RASSINIER BRAKE.

A NEW form of brake for motor-cars was shown at the recent exhibition in Paris by La Société des Freins à Galets Rassinier, of 199, Rue Championnet, Paris, in which rolling friction is adopted instead of plain sliding friction. As will be seen from the accompanying illustration, the device is composed of an annular ring A, fixed either to the hub or to the spokes of the rear wheel, a bracket B

bolted to the axle and a lever C C, which is fulcrumed on the short shaft E to press the rollers D D against the surfaces of the ring, which turns between them. The brake is certainly extremely simple; it is claimed that it cannot "fire," and that neither grease nor mud can affect its efficiency. A brake of this type has proved its efficiency on bicycles, for in the recent tests, organised by the Touring Club de France, it was accorded first prize for brakes acting on the hub. Some practical information as to its efficiency and durability on motor-cars would be interesting.

A RUN TO THE HIGHLANDS IN SNOW-TIME.

A FRIEND having important business in the Loch Voil district beyond Balquidder, and not being able to get convenient means of transport, commandeered the writer with his motor-car. Leaving Glasgow on a Monday at 10.15 a.m., a cold north-east wind had to be faced all the way to Stirling. However, plenty of wraps kept us quite warm and comfortable, and the sharp frost of the night before made the roads in fine condition for good going. Stirling was reached by 12.30, and after a hot lunch, we left at 1 p.m. for Callander, which was reached after a fine run at 2.20 p.m., where the petrol tank was filled up for the morning, and at 2.45 we left for Loch Vennachar, which was reached at 3.10 p.m. After transacting business there we left at 4.20 for Strathyre, crossing the old bridge at Colintogal ford on to the Trossachs road, and thence down to the main road, we turned to the left, and went up along the side of Loch Lubnaig, when at 5 p.m. Strathyre was reached.

Snow began to fall immediately after leaving Loch Vennachar, and by the time the Pass of Lenny was reached a perfect

IN THE SNOW NEAR CALLANDER.

snowstorm was raging, which made the last few miles to Strathyre rather unpleasant. We stayed overnight at Strathyre. The outlook next morning was not very favourable for our day's journey, there being a hard frost and two and a-half inches of snow on the ground. After an early breakfast, and having driven some fishing friends two miles down to Loch Lubnaig to the boats, we left at 9.15 a.m. for Loch Doine. At Kingshouse we turned left for the Braes o' Balquidder. After several sharp rises Balquidder's ruined church appeared on the right. Shortly after passing the quaint village, one of the Balquidder Braes proved too much for the car, owing to the slipping on the frozen snow. When standing there our gradometer showed the incline to be 1 in 6. However, being prepared for such an emergency, we took out some stout copper wire and wound it round the tires (an arrangement that works well with solid tires), and got up to the top all right, running to the head of Loch Voil without any further trouble. From the head of Loch Voil to the head of Loch Doine, a distance of three miles, the road is merely a cart track with some nasty snaps and turnings. The wind having risen, caused the snow to drift badly, threatening to block the road and cut us off in the midst of the mountains. We therefore made our stay as short as possible, and although we only arrived at 10.35, we left at 10.45, and got over the first three miles back as quickly as possible. After completing our business we made fair running through to Strathyre at 11.55, and after lunch left at 12.45 for Callander; arrived at 1.30, saw a friend there, and left at 1.50 p.m. With a non-stop run we passed through Stirling by a nice road round the back of the castle, and reached Glasgow at 5.45 p.m..

when I left my friend, and arrived home at 6.30, after a delightful run on snow all the way. The deepest snow was between Callander and Doine, where it was four inches deep, while all the way it was from two and a-half to three inches deep.

With the exception of filling the petrol and water tanks, the car needed no other attention, and in the two days we completed a trip of 143 miles, the distances being as follows:—First day: Barrhead to Glasgow, 6 miles; to Stirling, 26; Callander, 16; Loch Vennachar, 3; Strathyre, 9. Second day: Strathyre to Loch Doine, 13 miles; return to Strathyre, 13; to Callander, 9; to Glasgow, 42; and home again, 6 miles.

WALTER CREBER.

SKIDDING AND ITS REMEDIES.

THE motor-car is ordinarily a most perfectly controllable vehicle, except where the conditions of road surface, speed, and turns combine to cause it to skid. While means may eventually be found to entirely avoid this troublesome feature, the most promising path to pursue at present is that of reducing it below the danger limit by rational methods of construction.

Skidding in its underlying principles is rather a complicated question. It is a well-established fact, however, that it is due to the inertia of the mass of the vehicle, which tends to keep that mass moving in the same direction; and, on the other hand, to insufficient resistance to sideward motion of the wheels on the ground to prevent such motion being produced. In an iron-tired vehicle, for instance, the force tending to cause it to slew would be almost the same at the same speed, but as the narrow iron tyres sink deep into the mud, and as the least sideward motion only causes the tyre to dig deeper into the ground, the trouble is practically absent in such vehicles. The solid-rubber tyre in this respect, as in others, forms an intermediate between the iron and the pneumatic tyre, it being very well known that skidding is much less pronounced with solid than with pneumatic tyres. Some manufacturers of pneumatic tyres have tried to secure this advantage of the solid tyre by strongly reinforcing the tread of their pneumatics and giving the reinforcement a form corresponding to the tread of a solid tyre. This practice certainly does not add to the resiliency of the tyre nor to the life of the side walls of the same, but as a skidding preventive we would, remarks the *Horseless Age*, consider it more promising than the repeatedly suggested idea of providing the tread with a large number of small metal rivets. The Automobile Club of France, it will be remembered, held a contest of non-skidding tyres a year or so ago, and one or two of those—tyres with a tread of metal segments—entered were found to be possessed of this quality to a very satisfactory degree. They had so many other disadvantageous features, however—noisy, short-lived, etc.—that prospects of the skidding difficulty being solved along this line seem slight.

Increasing the length of the wheel base is a certain and one of the easiest ways of reducing skidding. The power which tends to swing the rear part of the vehicle around the front wheels increases with a decrease of the radius of the curve which the vehicle is turning. Giving the front or steering wheels the same limit of swing the shortest possible radius in which the vehicle may turn increases with the wheel base, and consequently the greatest possible skidding force is reduced by lengthening the wheel base. This is highly important, as dangerous skidding usually occurs only when the steering wheels have been brought to the limit of their swing, or nearly so, which is often done inadvertently and not because it is required by the condition of the road.

A CORRESPONDENT, W. B., asks if there is any means of repairing a cracked water jacket of a petrol motor cylinder. He has been recommended a method of rusting together the cracked portions by means of sal ammoniac and iron filings. While this has been found satisfactory to a certain extent, there is still a slight leak.

THE VALTER MOTOR-BICYCLE.

THE latest motor-bicycle of French construction to be brought before the notice of English motor-cyclists is the Valter, of which an illustration is here given. The motor, which is supported over the lower tube of the frame, is of 1½-h.p. capacity, and is fitted with electrical ignition and a spray type of carburettor. A feature of the machine is the transmission. A special form of bottom-bracket, in which is mounted a free-

wheel clutch, is used, this carrying two chain wheels, one being converted by a chain to the motor, and the other to the rear wheel. The petrol tank has a capacity sufficient for a run of about seventy miles, while sufficient lubricating oil can be carried for a journey of double that distance. The machine is made by La Société Française des Cycles, Automobiles Libertas, of Paris, and is being introduced into this country by M. L. de Salengre, of 11, Finsbury Square, London, E.C. Another point of the machine is its weight, this, we are informed, coming out at less than 50 lbs. for the complete motor-bicycle.

BEFORE returning to Europe again Fournier will, it is said, make another attempt at the mile record of 51.45 seconds held by himself.

THE Charron, Girardot, and Voigt Co. of America has been formed at Albany, U.S.A., with a capital of £100,000. Details concerning the new company, its future plans, etc., are rather meagre, but the object is, undoubtedly, to manufacture in the United States the new petrol vehicles which Messrs. Charron, Girardot, and Voigt exhibited at the recent Paris Show.

THE automobile mail-carts, which have now been running in Paris for upwards of a year, have given such satisfaction that M. Mougeot, the Under Secretary of State for Posts and Telegraphs, has decided to extend their use. Not only will they gradually entirely replace the horse-drawn mail-carts in the capital, but they are to be introduced into the more important provincial towns, such as Marseilles, Lyons, Lille, Bordeaux, etc.

ABOUT two years ago a Continental firm constructed a motor tyre 80 mm. size, which was used for voiturettes of 3½ to 4½-h.p. The rate of speed attained by these cars did not exceed 20 miles an hour. Nowadays, however, a voiturette of 5 to 8-h.p. is built by many motor-car manufacturers, and a speed ranging from 25 to 35 miles per hour can easily be attained. After studying the matter, the Continental Caoutchouc and Guttapercha Company came to the conclusion that a tyre of 85 mm. could be used with more success on a car of the higher speed, and very encouraging have been the results of trials made on the Continent with tyres of the larger size. The tread of this new-sized tyre is very narrow, securing greater speed and minimising the chances of the car slipping. The size of rims used for the Clipper-Continental 85 mm. tyre is exactly the same as that used for 90 mm. voiturette tyres.

HERE AND THERE.

A CORRESPONDENT took a trip on Sunday on a Holden bicycle drawing a trailer carrying a load of 13 stone. Going from Kennington to Woking he returned to London, having run sixty-five miles on one charge of petrol. At the end of the trip sufficient petrol remained for another twenty miles.

THE new steam bus of the Road Car Company has attracted much attention this week. Its route is between Oxford Circus and Hammersmith by way of the Bayswater Road, Notting Hill Gate, Holland Park, and Shepherd's Bush. As already stated in these columns, the vehicle is of the Thornycroft type.

THE Gillett Motor Company, Limited, has been registered, with a capital of £10,000, to adopt an agreement between the Motor Omnibus Syndicate, Limited, E. H. J. C. Gillett, J. Liver-side and Son, Limited, and W. B. Hurt (for the company), for the acquisition of certain patents for improvements in relation to water tube or sectional steam boilers and atmospheric burners for liquid hydro-carbons, and all assets and effects of the Motor Omnibus Syndicate, Limited, and to carry on the business of carriage, omnibus, and vehicle builders, etc. The registered office is at 27, Chancery Lane, W.C.

MR. ALFRED RIVETT, of the Blizzard Cycle Works, Leytonstone, has devised a very simple and yet effective improvement in the pulley for belt-driven motor-cycles. It consists of an ordinary deep-grooved pulley, in which are a number of transverse saw cuts. The soft hide of the belt beds itself slightly in the saw cuts, which prevent it slipping round the pulley, so that any slipping that has to be done to compensate for jerky engine-driving is done upon the large diameter belt-rim fixed to the road-wheel. The saw-cuts also have, it is claimed, the effect of scraping grease and road mud away from the belt, which is, consequently, kept cleaner than usual.

FROM the Speed-King Motor Works at Guildford, Messrs. Dennis Brothers, Limited, send us a copy of their new price list, in which the 1902 patterns of their Dennis cars are illustrated and described. These are fitted with engines of 8 and 10 h.p. respectively, the latter being a twin-cylinder slow-speed governed motor. The firm's convertible motor-quadracycle and motor-tricycle are also illustrated, both having some useful improvements on the designs already known to the motor world. Light trailing cars and a motor-bicycle with a 1½ h.p. engine, and capable of attaining a speed of thirty miles an hour, are also included in the catalogue.

THE motor-driven cycle sledge has made its appearance in Chicago. Mr. I. H. Whipple, of the Whipple Cycle Company, of that city, is its originator, and, in a letter to the *Bicycling World*,

of New York, he vouches for the fact that it is eminently practical. As the illustration indicates, the sledge is a Mitchell motor-bicycle with the front wheel removed and runners substituted.

THE UNITED MOTOR INDUSTRIES, LIMITED, 42, Great Castle Street, London, W., have sent us a small tin of "D" lubricating oil packed in a new form. The can contains half a litre, equal to about one pint, this size having been introduced in answer to many requests from motor-cyclists and cycle agents. "D" lubricating oil has long been used for the lubrication of small high-speed motors, and is therefore distinctly applicable to motor-bicycles.

AN Automobile Club is in course of formation at Nantes, France.

THE Hon. J. Scott Montagu, M.P., has been giving a lecture to the boys of Eton College on automobilism.

A LIGHT railway is being suggested to connect the towns of Deal and Sandwich. Why not develop a motor-car service?

MESSRS. JOHN HUTTON AND CO., of Dublin, have been appointed agents for Leinster for the Electric Ignition Company.

THE London General Omnibus Company are about to place a Fischer gasoline-electric omnibus upon one of their routes with a view to testing its suitability for London thoroughfares.

WE understand that Messrs. De Dion and Bouton are about to introduce a small petrol motor of 1½ h.p. for motor-bicycles. The same firm are also at work on a two-cylinder motor of 12 h.p.

A LONG list of repairers has been adopted by the Automobile Club, including thirteen firms in various parts of London and others at most of the leading commercial centres and holiday resorts.

THE Motor Cycling Club will open their season on April 12th with a run to Brighton, meeting at the Railway Hotel, Purley Corner, at 4 p.m. This fixture is an open one, all motor-cyclists being invited to join the party.

It is time, says the *Yorkshire Herald*, that all obstacles to the progress of the automobile industry in the British Isles were removed. If they are not, foreign producers will continue to reap the advantage of our tardiness and prejudice.

THE "Lonsdale" type of motor-carriage has been supplied to Lord Manners by the Daimler Company, and is exciting much favourable comment at Oakham. A similar car was despatched from the Daimler works on Saturday to Mr. L. Walker Munro.

MESSRS. SALSURY AND SON, of Green Street, Blackfriars, S.E., have sent us samples of their "Excelene" lubricating oil, for air and water-cooled motors. We have tried the latter in a two-cylinder motor, and find it gives very satisfactory results. One good point about the oil would appear to be that it does not become too thin under the action of a warm temperature.

THE annual general meeting of the Cyclists' Touring Club at Nottingham on Friday last week endorsed a decision of last year's London meeting to refuse membership to automobilists. The debate on the question at Nottingham was confined to members of the Council and raised no fresh points, but the Club solicitor expressed his opinion that the Board of Trade would not sanction the alteration of the memorandum of association unless the word "limited" was added to the title. Mr. Pennell, who had ridden to the meeting from London on a Phoenix motor-bicycle, declared that no alteration in the memorandum would be necessary.

AMONG the vehicles which attracted considerable attention at the recent automobile exhibition in Paris were the latest models of the Boyer cars. The illustration on page 51 gives a general view of the 12 h.p. *tonneau* of this type. The Motor Traction Company, Ltd., who are the agents for the vehicles in this country, inform us that they can be fitted with either a 12 h.p. double cylinder Aster or Buchet motor, as desired. The ignition is, of course, electrical, while the water circulation is maintained by means of a pump and radiator. The motor, which is fitted with a governor, is set under a bonnet in the fore-part of the frame. The latter is constructed of wood and steel combined. As regards the transmission, three speeds forward and reverse motion are provided, although we understand that a fourth forward speed can be added if required. The motor transmits its power through a friction clutch to the oil-containing gear box, which is connected by bevel gear to a differential countershaft, the usual duplicate pair of chain and chain wheels connecting the latter with the rear road wheels. Steering is controlled by an inclined hand wheel, while both hand and foot brakes are fitted. The road wheels are of the artillery type, of equal size, and are shod with large pneumatic tires.

THE Grand Duchess of Hesse, who is at present at Nice, drove in her motor-car the other day to attend the Cannes races as the guest of the Grand Duke Michael and Countess Torby.

THE National Cyclists' Union has decided that it is at present inadvisable to permit motor-pacing in open amateur cycle races, but a provisional arrangement has been made by which centres may allow single motor bicycle pacing in club events.

A RUMOUR is current to the effect that Messrs. De Dion and Bouton have decided to revert to the plan of locating the motor in their light cars in the rear part of the frame. We know that the position of the water-circulating pump has been altered, and wonder if confusion has arisen by reason of this change.

WE learn that M. Buchet, of Paris, has designed an engine of 2 h.p., weighing only about 25 lbs., for motor-bicycles. Arrangements have been made by a leading firm of cycle manufacturers in Coventry to use the Buchet motor in a new machine, to be put on the English market as the Victoria motor-bicycle.

POLICE regulations, which come into operation on April 1st, in the province of Brandenburg, Germany, enjoin upon motorists to place on their cars white plaques bearing numbers twelve centimetres (4¾ in.) high, the figures being black, distant from each other two centimetres (¾ in.), and being traced in strokes two centimetres broad. These plaques must be lighted at night.

AT length South Wales has its motor-car show-rooms. There have just been opened by Mr. W. Parker Thomas, at 35, Westgate Street, Cardiff, a good central position in this enterprising town. Under the title of the South Wales Motor Company Mr. Thomas proposes to supply all kinds of cars, and to have an efficient staff of mechanics to do necessary repairs to vehicles that may be in trouble in or near Cardiff. He has been connected with the motor-car industry for five years, the last two of which have been spent in South Wales.

THE accompanying illustration shows a new pump for use in connection with the lubrication of the motors of motor-bicycles. The pump, which is adapted to be attached to the rear forks or

seat tube of the frame, is very small, and so occupies but little space. It is fitted with a two-way cock, the pump barrel holding sufficient oil for one charge of the crank case. It is being put on the market by the London Autocar Company, Limited.

PASSING through Watford the other day on his 6½-h.p. Daimler Sir Henry Thomson, the eminent physician, had an experience which, though not uncommon to motorists, is worthy of note. He was proceeding along the High Street at, of course, the legal limit, when a collie dog rushed at the car, apparently to attack the front of the near side wheel, over which Sir Henry was seated. It seemed as though the head of the animal would certainly be crushed, but happily the road was dry, and the driver was able to arrest the progress of the car in the space of nine or ten feet. With a rather larger car the distance would have been greater, no doubt, but Sir Henry Thomson is of opinion that from eighteen inches to two feet ought to suffice, when immediate stoppage is required. His testimony to this effect, just published in the *Times*, adds another to the services he has already rendered to the cause of automobilism.

CORRESPONDENCE.

COST OF MAINTENANCE.

TO THE EDITOR OF *The Motor-car Journal*.

SIR,—In your last week's issue I observe with consternation that the expense of a motor-car is £246 per annum for daily running of from thirty to forty miles. Surely there must be something rather extraordinary in this statement. Petrol and lubricating oil figure at £87 5s. 8d.; paraffin, grease, and polish, £25; and recovering and repairing tyres, £85!

If motoring cannot be enjoyed for very much less than this, then only the very rich can hope to contemplate the sport. It will obviously be much less expensive to keep a horse and carriage. Ultimately, motor manufacturers will, I imagine, have to look to the well-to-do middle classes for support of the industry; but, if the above statements are correct, manufacturers will have to look in vain.

Many people, like myself, with only moderate incomes, are doubtless anxious to possess a car, but I am satisfied that they are deterred from want of a definite knowledge of the annual expense, and I trust that those who have had experience and kept accounts will be induced to give publicity to the results.—Yours truly,

LEX.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to refer to the interesting letter of "A Motorist" in last week's *Journal*, and I trust the writer will pardon me when I say that I think he has made the cost come out much higher than is absolutely necessary for efficient and comfortable running. The first item is petrol at 1s. per gallon for the year, £60. Now, it is not putting a very high efficiency on a car to say that twenty miles should be done on one gallon, so that 24,000 miles should have been travelled, or over 65½ miles a day for every single day of the year. Some error must have crept in and caused this item to be shown as very excessive. Had 40 miles per day been done for 365 days the cost would only be £36 10s.

As to the second item, I cannot say, as I have always run a solid tyred car, my present one being a 7-h.p. Daimler, which had done some work when I bought it a year and five months ago; but I have done many thousands of miles on it over all sorts of roads, and I have only spent £3 13s. on this item. It is only fair to say that some kind of wheel tyres must now be renewed at a cost of about £16. It may be said that mine is a moderate-speeded car, but for ordinary useful work I find it fast enough, as I can average over twenty miles an hour on good roads.

The third item seems to me very excessive, as paraffin, grease, polish, brushes, rubbers, etc., should not come to anything like £25. Five gallons of paraffin at 9d. per gallon should be ample, unless the carriage is washed in it. I think 5s. should suffice for paraffin. I have not used 10 lbs. of grease, at 1s. per lb., in the seventeen months. Ten boxes of polish at 1s. 6d. would be the extent of my consumption. Three spoke brushes at 5s. 6d., five sponges at 2s. 6d., and four washleathers at 3s. have cleaned my car and several carriages for the year, and I purchased 15s. worth of rubbers, which are not yet all used, so that for about £4 I have got all cleaning materials for carriages and car, and grease for the latter.

Surely the fourth item could not come to £27 5s. 8d. Last year I used not quite ten gallons of heavy gas-engine oil at 3s., and about three gallons of special gear box oil at 4s.

I find my Bleriot costs nearly 3d. an hour, and we might assume that 500 hours would be an ample allowance for the year, which brings the cost out at £6 5s. 4d. I purchase the acetylite at 6d. per lb.

I presume "Motorist's" car weighs over a ton, so that the licence costs £4 4s. I insured at first for all sorts of things, but I have given up all but the fire insurance at £2 per year, as I do not think with moderate driving the claims are likely to be numerous or heavy.

The last item seems to me fairly stated, though I have kept my car up for much less, and the original brasses are all still in use. May I here state that I have found the white anti-friction metal a very cheap and easy form of repairing brasses.

I find that the actual cost of repairs last year came to £12 15s., and every bearing is sound and in good order, though I want new third speed gear on the sleeve, which will, of course, go in this year's account. So that the totals came out at:—

	£	s.	d.
Petrol at 1s. per gallon for 40 miles per day	36	10	0
Renewing solid tyres, including new ones just ordered	19	0	0
Paraffin, grease, polish, brushes, rubbers, etc.	4	0	0
Lubricating oil and trimming for lamp	8	7	4
Insurance and licence	4	2	0
Replacements and repairs	12	15	0
	£84	14	4

The new tyres, £16, ought not to be charged, nor ought so much petrol, as I did only 8,500 miles last year, but I give these items on the highest scale.

Given a well-made English car, careful usage, cleanliness, and attention to lubrication there is no reason why maintenance should be excessive.

The statement of "Motorist" as to the wages of his mechanic would most certainly tend to prevent many persons of moderate means from even contemplating buying a motor-car. Such a man would be quite wasted if only one car were kept. People do not employ veterinary surgeons as grooms in their stables because a horse may at some time be ill, and it is much better to send your car to proper repair shops where good machine

tools are kept, than to employ a skilled mechanic, who is half his time sitting on the back seat of the car, when he might be much better employed using his brains and skill at his trade. What is wanted, it seems to me, is a man who is a good cleaner and oiler, who knows the working of his particular car, and realises when a bearing or other part gets worn, that his duty is to tell the owner, who should get the refitting done by competent people and with the aid of proper tools. The little derangements that take place on the road do not call for much actual mechanical skill, but patience, common-sense, and large reasoning powers, and I know several such men who are keeping doctors' cars spick and span for certainly, in some cases, less than £1 per week.

In my case, for instance, no repairs have been done since last October other than grinding valves, adjusting chains, and changing a sparking plug—why, then, should I keep a skilled mechanic for weeks and months for a repair which may not come?

Once mastered, there is nothing either mysterious or supernatural about a motor-car, though to hear the statements and conversation of some mechanics, one would imagine that it was pretty full of both. Every owner should take the trouble to know his car; he is then independent of everyone.—Yours truly,

COUNTRY MOUSE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am greatly interested in "A Motorist's" letter in your last issue. In the interest of so young an industry it is surely of vital importance to place before the public figures showing the minimum cost of maintenance and running of private cars rather than to publish figures disclosing an abnormally heavy expenditure. I venture to suggest that few of us are able to afford the annual expenditure named by your correspondent, i.e., £396 9s. 8d., to which must be added housing for his man and interest on capital outlay, say £500 per annum. It is reasonable to suppose that any competent mechanic who is capable of erecting the machines in the shops should with a little practice become a good driver, and his shop experience would then enable him to effect any repair. I fail to understand why such a man, who in the shops can earn 33s. to 45s. per week of fifty-four hours should expect a greatly increased wage on entering private service as a driver. It should be borne in mind that this work is not only pleasant but exceedingly light, and it is difficult to imagine how a man can fill his time attending to one small car of 8 to 12 h.p. In my experience these posts are generally filled by men who are not capable of or willing to work sufficiently hard in the shops to enable them to earn a decent wage, and they start out as "motor experts," etc., accordingly. It would certainly appear that value is not received by private employers of this class of man, at all in proportion to the high rate of wage paid. Incidentally, some of the figures given by your correspondent appear remarkable. For instance, he states that he runs on an average thirty to forty miles per day. Taking the latter figure he would run about 14,400 miles per year of 365 days, whereas his petrol account would (on the basis of twenty-five miles to a gallon) carry him nearly 30,000 miles. Lubricating oil appears extraordinary also, and supposing that £25 of this item covers the oil portion, it would seem that "A Motorist" has used 100 gallons, if he pays the usual figure for high grade oil of 5s. It is surely impossible to use such a quantity on one small car, particularly when one notes that grease is also used as a lubricant. The remaining items (together £135) covering repairs, tyres, and sundries should certainly enable "Motorist's" mechanic to keep one small car in an excellent state of repair and efficiency. It would be interesting to learn the type of car and the nature of the roads usually traversed, as both should surely be carefully avoided by the general public.—Yours truly,

A MECHANICAL ENGINEER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"A Motorist" does not seem to have quite grasped the point of my letter. My object was to show how much a car could be kept for, not how much a car might be made to cost in upkeep. Of course I quite realise that the position of "A Motorist" must be a very satisfactory one, being able to pay his man £150 per year, provide him with a house and be proud of the fact that his 8 to 12 h.p. car costs him £246 9s. 8d. per year to keep going, but such statements are not conducive to the popularisation of the motor-car, and from a manufacturer's point of view are disastrous. From "A Motorist's" letter I gather that he is not what is generally accepted as a motorist, but only the owner of a car with a man to drive him about; motorists, as a rule, prefer not to put their cars entirely in the hands of an expert, but to be masters of their own machines, to drive them, and to take a lively interest in the details of their construction. A man at £50 per year is all such a motorist generally requires, to look to the petrol and water, to do the oiling and cleaning, and generally to work under instructions of the owner in the event of any small stoppage by the roadside; there are many such men to be obtained, and good men too, and men who will not "absolutely refuse" to lend a helping hand on other cars if instructed to do so.—Yours truly,

MAWDSLEY BROOKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One of the most striking features of your last issue was the letter of "A Motorist." That gentleman keeps a mechanic at £150 per annum and house free to look after a car with "8 to 12 h.p. motor." One does not know what sort of motor that may be, but from "A Motorist's" figures it consumes for a run of 50 miles, 7 gallons of petrol, 1 gallon of paraffin, 1 lb. of grease, ½ gallon of lubricating oil, and altogether costs just on 1s. per mile run, without allowing for depreciation. Save me from such a car and such a manager.—Yours faithfully,

ECONOMY.

THE BUCHET ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the query of Messrs. Roots and Venables re the weight of the 40 h.p. Buchet Engine, we have pleasure in stating, that the weight of the 40 h.p. is 175 kilos. (3 cwt. 2 qrs.); the 24 h.p. engine (four cylinder) is 160 kilos.; the 24 h.p. engine (two cylinder) is 130 kilos.; the 16 h.p. engine (four cylinder) is 110 kilos.; the 12 h.p. engine (two cylinder) is 95 kilos.; the 8½ h.p. engine (two cylinder) is 57 kilos.; the 6½ h.p. engine (one cylinder) is 53 kilos.—Yours faithfully,

BRANDES AND PERKINS.

CONVERSION OF ELECTRIC TO TUBE IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I find so much endless trouble and annoyance from the uncertainty of electric ignitions, that I wish to know if it would not be possible to replace the ordinary De Dion plug by a special fitting to receive the platinum tube. The lamp, etc., could then be fitted much as usual.—Yours truly,

SEVEN HORSE.

GREASE FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to a letter, signed Harry Harris, re Grease for Motor-cars, in your issue of the 8th inst., I do not agree with the advice he gives. To put grease into the gear box is satisfactory as regards the gear wheel teeth, but it is not good for the bearings, as the grease does not work its way in, and all gear boxes should be made a sufficiently good fit to be oil retaining. I have personally experimented with grease and oil, and unhesitatingly recommend the latter. It is only a question of making the gear box well enough.—Yours truly,

S. F. EDGE.

L'ALLUMEUR ELECTRO-CATALYTIQUE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if any of your readers could inform me on the following subject. In the issue of the *Journal* of February 22nd last there is a description given of M. Wydts' "metallic" ignition. I quote one sentence:—"A few seconds after starting the motor, even this weak current, for which any small battery is sufficient, may be cut out and the alloy will take care of all subsequent explosions by its mere presence in the combustion chamber."

What does this last clause mean? The part I cannot understand is how regular sparking is to be obtained. If the alloy is kept constantly incandescent, how will the explosions occur and with what precision?—Yours faithfully,

A. H. FORSYTH.

[As was explained in our issue of December 28th last, a catalytic body is one which has the property of becoming heated and even incandescent when surrounded by hydrogen gas, by means of the condensation on its surface of an infinitesimal quantity of this gas. M. Wydts has discovered an alloy of osmium, iridium, and ruthenium, which constitutes a metal at once extremely porous, absolutely inoxidisable, and able to withstand 1,700 deg. Centigrade of heat, and which has, at the same time, the property of becoming incandescent in carburetted hydrogen, made more or less with azote, oxygen, or carbonic acid. M. Wydts' ignition block consists, therefore, of a plug very similar in appearance to the ordinary sparking plug. Inside the plug is a little spiral wire coil of this wonderful metal, one end of which is connected to each of two insulated terminals on the outside of the plug. To these terminals are also attached the two wires of a tiny primary battery. The following is the *modus operandi*. The switch of the battery circuit being turned on, the coil of this new metal inside the cylinder of the motor becomes incandescent and the motor can be started. The switch is then turned off, and the continual condensation of the gases on the new alloy, which takes place as the explosive mixture is brought in contact with it on the compression stroke, keeps the spiral coil incandescent and at a temperature sufficient to fire the charge.—Ed. M.C.J.]

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of February 22nd last, I notice that Mr. T. F. Hunt says he uses one quart of petrol to drive his 1900 Werner 35 miles. Perhaps a few figures, representing the petrol consumption of my 1901 Werner, may possibly interest him and other users of motor-bicycles. I may state beforehand that the motor-pulley is 70 mm. in diameter, compared with the usual 60 mm., and that the bicycle wheels are 28 in., and not the ordinary 26 in. This at once gives a speed-ratio of 39 to 49 in comparison with the usual machine, i.e., my engine makes approximately four revolutions to five of the normal type. Since, however, the diameter of the 1900 cylinder to that of 1901 is as 62 to 64, the final consumption ratio of the two would be approximately as 47 to 40. I have frequently found that my motor used two litres (3½ pints) of petrol in driving me 80 miles. Now I happened to go from London to Reading one day last week, returning the next day. This, with an extra 10 miles in addition, made a total of 90 miles, and I used exactly four pints (half a gallon). This, by the way, with petrol at 1s. per gallon, means 15 miles for a penny! Mr. Hunt's nine half-pints would therefore have driven me 101 miles, as against his 78½. I may tell him, however, that I very rarely use the full power of the engine, unless when climbing steep hills. The throttle valve is generally about three-quarter to two-thirds open. As I did the 41 miles, from Picca-

dilly Circus to Caversham Heights, in 2 hours 15 minutes, and the return journey in 2 hours and 10 minutes, he will see that the engine gives quite enough power at this rate of consumption, seeing that I always traverse towns and villages at 7 to 10 miles an hour.

I read a letter from "J. A." in your latter issue. I am sorry that he seems so mysteriously unfortunate in his experiences. I may tell him that my three Werners have carried me about 10,200 miles, and I have taken the train but once owing to breakdown, and that was due to meddling strangers (they are infinitely more to be feared than a breakdown!) getting access to my machine and letting it fall, smashing the trembler and gas-pipe from carburettor. My present machine has now carried me 2,200 miles without a breakdown, and I feel very certain that "J. A." could have much the same experience if he so willed.—Yours truly,

A. L. BENETT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "J. A.," I would say he must see to adjustments. As to spoiling clothes, I used one suit for riding all last year, and it does not look much the worse for wear. Oil spots can easily be removed with a little petrol, but, with careful lubrication, not many should appear unless the hands are wiped on the clothes in preference to a piece of waste.

The machines that I have found satisfactory are the Werner and Phoenix, and I may state that I have bought a 1902 rear-driven Werner and am anxiously waiting for its arrival.

In answer to Mr. Pennell, I shall be pleased to accompany him on one of his own machines (if of the make named) for a 200-mile spin, 100 out, and home, just to show that the motor-bicycle is not quite so unreliable as stated and to show that the average machine, with careful driving, will go, as I feel certain that half the so-called mishaps are the fault of the rider. Still, I will not say that the motor-bicycle is perfect, which is proved by the constant improvements being made. As to climbing hills, both makes are capable of mounting all gradients on the main road between London and Portsmouth.—Yours sincerely,

HENRY KENNETT, JUN.

THE SPEED OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having noticed one or two ideas which have been brought forward lately as regards the present ambiguity in the way of recognising, or proving the fact that drivers of motor-cars have exceeded the speed limit, I venture to propose one which occurred to me the other day. Could not some kind of meter be attached to each car, something after the style of the ordinary cyclometer, which might be geared to the road-wheels, and could register the pace that each mile was traversed at? Then when required by the police or other officers appointed for that purpose, the meter could be examined; and, to be always in sight of the driver, thus giving him fair warning not to overstep the mark, the meter might be placed in some conspicuous place. Hoping this may be of some use to somebody with more brains than myself.—Yours truly,

O. K.

BELT-DRIVEN CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent, H. Elliott, my experience is that the best drive down an ordinary hill is got by throwing in top gear and throttling to desired speed. If the hill is very stiff the same end may be attained by throwing in low gear. A free engine down hill is very apt to lead to a still engine at bottom; besides, the legitimate use of brakes is to stop the car, not regulate its running, friction being opposed to economy. A belt that will hold under all circumstances and in any sort of weather may be produced by running a canvas belt on the top of the ordinary leather one.—Yours truly,

R. LAMONT.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having had considerable difficulty with my steam car I should be glad to have the experience of other users as to the cast-iron fire box, which, I hear, is now being used on some vehicles; also, is there a satisfactory paraffin burner on the market? That with which my car has been fitted has been a source of much worry.—Yours truly,

M. D.

EXPERIENCES WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a regular reader of your journal I am somewhat disappointed that other subscribers do not more frequently contribute a warning note as to the cause of their breakdowns. It is a truism that we learn more from our mistakes than from our successes, although doubtless the cynically-minded might say that we learn still more from the misfortunes of our friends. I do not yet own a car, but hope to do so before the month is out. Are these all "yarns" that I hear of the frequency of breakdowns? A friend tells me that he was visited at his place in the country last Sunday by two parties on cars. One took half an hour to restart his motor; the other could not start it at all, and had to leave it there till a mechanic from London came down next day. Another acquaintance is in the surgeon's hands with a dislocated shoulder, from being thrown out of a car. So far as I can follow the account, he was coming home with a loose chain when it jumped the sprocket and the car overturned. It is needless to add to the list of breakdowns. I only give

the latest which have reached my ears, and from reliable sources. It seems to me a great pity that those who have such accidents do not contribute to your pages an account of what happened, why it happened, and how it was put right. Must we all buy our experience in the bitter market of affliction? Doubtless to many motorists these breakdowns bring their own lessons, so that they never occur a second time, but they would be promoting the sport, removing prejudice, and encouraging beginners like myself by publishing a kindly note of warning and advice. They can do it under a *nom de plume* if they feel that their exploits have been too ridiculous. As I have every intention of making known my own failures when I start on them, will no one tell us how he has been "hung up"?—Yours faithfully, Doc.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am heading this note as above in order that you may be able to refer to previous correspondence on the same subject, although I almost think a more appropriate title would be "Spare us from our friends." We have not entered into the discussion before, as we did not think it in any way useful to try and prove which maker used the various parts under dispute, first; but as your correspondent, "Geo. Henderson," in last week's

as reasonable to expect Panhard and Levassor to use a horizontal engine with their system of transmission gear as it would be to expect us to use a vertical one with ours.

We use a horizontal engine because:—(1) We are enabled to employ a more efficient system of transmission; (2) we have less lubrication troubles; (3) we can keep the engine cool with much less water, and without any fear of the breech end and the cylinder jacket running dry; (4) we can get at and dismantle the parts of the engine more readily; (5) we get lower centre of gravity and yet more clearance between the motor and the ground; (6) straight front axle; (7) the heavy portion of the motor can be placed nearer to the rear wheel without in any way interfering with or raising the footboard (this is a big consideration with some types of carriages); and, lastly, we get no twisting action on the frame. I might very well hide our practice behind the fact that Messrs. Crossley Brothers, Limited, of Manchester, make more horizontal internal combustion engines in one week than any motor-car maker in a month. This, however, would hardly be right, as everything made by human hands is only a compromise; therefore it is just as necessary to adapt each and every part of a motor-car to one another as it is to use a vertical engine in a screw steamer, and in order to set at rest any fears of our making a change we may say that we shall probably use vertical engines when we use a wind propeller at the back to "wait" our cars along.—Yours truly, H. AUSTIN.

Wolsley Tool and Motor-Car Company, Limited.

THE BOYER 12 H.P. TWO-CYLINDER CAR. (See page 48.)

issue, has turned away from the original subject, and gratuitously tries to throw discredit on our productions, we think it would perhaps be as well to point out how unfair and unreasonable such letters are.

Unfortunately, we have not the honour of knowing either "Mr. Hector" or "Mr. Henderson," and consequently can only surmise why the former has such a good opinion and the latter such a bad opinion of our cars. Without giving any reasons *pro* or *con*, Mr. Henderson assumes that the fact of most continental makers using vertical engines is an undeniable proof that any other form must be wrong. Arguments of this kind are so ridiculous that it is almost useless giving them a second thought were it not for the fact they might mislead some of your readers who are not well versed in the subject. Most persons connected with the industry know why there is such a sameness in the design of present-day French cars. For years various firms in France have been experimenting, usually with bad judgment, and often with little mechanical training, with the inevitable result that in many cases they have spent all their money, and now, as a last resource, are copying the one really successful firm without rhyme or reason, other than the hope that it will help them out of their difficulties and enable them to dispense with any more costly experiments. In no single case can it be proved that the cause of their failures was owing to their using horizontal engines, neither can it be proved that the present satisfactory position of the Panhard and Levassor Company is in any way dependent on their using vertical engines. In my humble opinion their success lies in their having stuck to one design, so enabling them, by dint of careful management, and manufacturing in large quantities, to minimise any defect that may exist in their design of road carriage. It would be just

M. WORTH, the French costumier, has established himself in Burlington Street, W., and is giving attention to motor-coats for ladies.

IN reply to "India," the address of the makers of the Sthenos carburettor is M. Moisson, 13, Grande Rue de Monplaisir, Lyons, France.

BEFORE the Lord Chief Justice, Mr. Justice Darling, and Mr. Justice Channell, in the King's Bench Division, last week, the case of *Gorham v. Brice* was heard. It was an appeal against a decision of the Justices of Surrey, who had convicted the appellant, Mr. Gorham, for driving a motor-car at an excessive speed, and fined him £5 and 10s. 6d. costs. In dismissing the appeal the Lord Chief Justice said he was unable to understand what was the motive of bringing these appeals.

SINCE the account of the Brooke Car was published in our issue of the 22nd ult. it has had a severe testing on the roads of the East Coast, some of which are exceptionally heavy running. The car has now been fitted with a Renold Silent chain and a new exhaust-controlling governor. It is a throttle governor working from a small pipe from the exhaust, the number of explosions controlling the admission of the mixture.

A MOTOR-WAGON ON THE TRAM RAILS.

IN the Belfast Summons Court, before Messrs. F. G. Hodder, R.M., and E. Pim, J.P., the Belfast Street Tramway Company summoned Samuel Montgomery and Leslie Porter for obstructing a tramcar on February 12th, by keeping a motor-wagon on the rails. Mr. Kerr, in opening the case, said that he had the defendant, Mr. Porter, summoned about a fortnight ago for this offence, but a question arose as to whether it was he who was driving the vehicle at the time, and the case was adjourned. He (Mr. Kerr) also had the driver, Mr. Montgomery, summoned. Mr. Thompson, conductor, deposed that he remembered the day in question. The tramcar was going up the Shankill Road, and defendants had their motor-wagon, loaded with bags, on the rails. They kept on the rails for nearly half a mile. Witness told Mr. Porter to get off the rails, but he refused. The tram was greatly delayed. Witness spoke to a policeman about it. In his opinion there was nothing to prevent the wagon from leaving the line. There was snow on the road, but he did not measure the depth. There was no snow on the tram lines; it was melted with salt. They overtook the wagon at Diamond Street, which is about half a mile from Lawnbrook Avenue, where defendant left the line. The motor-vehicle was going at the rate of about three miles an hour. Constable De Vere having given evidence, Mr. Donnelly said that before calling his witnesses for the defence he would like to say that on the day in question his clients did all they possibly could to get off the line, but their efforts were without success, as it was impossible to get off at Agnes Street owing to the depth of the snow. They turned into Lawnbrook Avenue, where the snow was cleared. Mr. Porter, for the defence, was examined. He deposed that he was on the wagon on the day in question. Witness and Mr. Montgomery did all in their power to get off the line at Agnes Street, but the snow was too deep. Mr. Hodder, in giving the decision, said that they had given the case every consideration. In his opinion the defendants did all in their power to get off the tram line at Agnes Street, but the snow was too deep. They kept on the line until they got to Lawnbrook Avenue, where the snow, as Sergeant Horan had said, was not so deep. He would dismiss the case on its merits, with 20s. costs.

CLAIM FOR DAMAGES DISMISSED.

AT the Wakefield County Court, Judge Greenhow heard a claim for £10 10s. damages for personal injuries, and £4 17s. 6d. damages to a trap. The plaintiff was Jonathan Ramsden, Dewsbury, and the defendant George Frederick Firth, Wakefield. On Saturday, July 6th, plaintiff was driving into Wakefield from Oulton with two companions, and when near the County Hall defendant, it was alleged, approached them at a high speed on a motor-car. The horse shied, pitched the occupants of the trap out upon the pavement, and snapped the shafts. It was alleged by plaintiff that the motor-car was travelling at a rate of fourteen or fifteen miles an hour. The defence was that there had not been the slightest negligence. Defendant was on his proper side of the road, and it was contended that the motor-car was travelling at about only six miles an hour. The wooden pavement was slippery, which no doubt caused the horse to fall. His honour gave a verdict for defendant. The action was not maintainable, inasmuch as machines of this kind were now legalised on the highway.

A REPAIRING CASE.

IN the Westminster County Court last week Judge Woodfall heard the case of the Motor Power Company v. Biddell, in which the plaintiffs sued a gentleman residing at Choriton, Hampshire, to recover the sum of £13 19s. 8d. in respect of repairs done to a motor-car. His Honour gave judgment for the plaintiffs for ten guineas, and costs.

MAKING TOP OF MOTOR-BUS.

AT Brompton County Court, on Monday, before Judge Stonor, Mr. George Henry Goldby, motor-carriage builder, Star Road, Fulham, S.W., brought an action against Mr. Francis Joseph Bell, motor-omnibus proprietor, Stanley Road, Fulham, and Bournemouth, the claim being for £25, the price of the top portion of a motor-omnibus, said to have been made to order under a contract. Plaintiff's counsel, Mr. G. Browne, explained that the case had been remitted from the High Court, and the main question which his Honour would be called upon to decide appeared to be whether the work of making the top of the motor-bus had been done within a reasonable time. Ultimately, after counsel and witnesses on both sides had been heard, the defendant agreed to take the motor top in question for £25, and the case was struck out without costs.

CLAIM FOR MOTOR-CAR HIRE.

AT the Newbury Petty Sessions, Messrs. Stradling and Plenty, motor-car agents, brought an action against Dr. W. S. Whitcombe, of Aldermaston, claiming £24, being the balance of account for the hire of a motor-car from July 12th, 1901, for three months. After a long hearing, the judge gave judgment for the plaintiffs for the amount claimed.

FURIOUS DRIVING CASES.

MR. FRANK CARR, Stanwix Villa, Carlisle, was before the County Police Court at Carlisle a few days ago on two charges, one of driving his motor cycle too rapidly, and the other of failing to give proper warning. The complainant was Superintendent Graham, who was riding on horse-back on the Crosby Road when Mr. Carr came along. The horse proved restive, and the superintendent said he had to use both hands to prevent it breaking away, and was unable for some time to hold up his arm to require the defendant to stop. Mr. Carr, who was defended by Mr. G. A. Lightfoot, submitted that he slowed up as soon as he saw the horse quicken its pace, and did not consider it necessary to sound the bell or horn. He used every care not to frighten the horse. The Bench fined the defendant £1 and cost.

THE first charge of furious driving in Oldham against a motorist was heard at the local police-court the other day. Charles Saunders was summoned for driving a motor-cycle at from 18 to 20 miles an hour. Police-constable Godbold stated that the defendant and another gentleman came along King Street on a motor-cycle at a furious rate, and failed to stop when signalled. They rode through a narrow passage, and almost ran into a hansom cab. A couple of hours afterwards the constable stopped the defendant in Union Street. The defendant denied that he was driving at more than eight miles an hour. Fined 5s. and costs.

JOHN BOULD appeared before the Stipendiary at Cardiff Police-court charged with furiously driving a motor-tricycle. Police-constable James deposed that at 6.45 p.m. on Sunday, 2nd inst., he saw defendant in Ninian-road careering along at a rate of about fifteen miles an hour. By the stipendiary: The road is of medium breadth, and was full of people. The machine was forced along so rapidly that it kept jumping. The officer admitted that he had no guide as to the speed beyond his own eyes. His Worship did not think it would be safe to convict under the circumstances. One was likely to be misled without some guide. The case was dismissed. There was a second summons for riding without a light, and for that the Stipendiary imposed a fine of 40s. and costs, or fourteen days.

NO LIGHTS.

AT Newton (near Liverpool) Petty Sessions, Louis Forster, Earlestown, was fined 1s. including costs, for riding a motor-car without a light, in Earlestown, at 12.20 a.m., on a recent Tuesday.

LIONEL STEAD, driver of a motor-wagon for Messrs. Stones and Co., brewers, Sheffield, was proceeding through Ecclesfield at about half-past eight on the evening of February 25th, when it was observed that his lamp did not display the red illumination. He was stopped, and the regulation lamp was found broken inside the wagon. Superintendent Bielby said that the police were willing to withdraw the case on payment of the costs. The costs were paid, and the case was accordingly withdrawn.

THE works of the Locomobile Company have now been removed from Page Street, Westminster, to their new premises at 39-43, Sussex Place, South Kensington, S.W.

ON Saturday last an auction sale of motor-cars took place on the premises of the Scottish Motor Company, Limited, Edinburgh. Mr. E. J. Irvine was the auctioneer, and the bidding was exceedingly brisk, very good prices being realised.

AT 34, Queen Street, E.C., a garage has been opened with accommodation for about a hundred cars. Mr. Harrington Moore's new company, Garages, Limited, will celebrate the formal opening of the garage by an auction sale of cars belonging to members of the Automobile Club, on Tuesday, the 22nd prox.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, MARCH 29, 1902.

[No. 160.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MEMBERS of the Yorkshire Automobile Club will meet at Harrogate on Easter Sunday, and doubtless many will stay over the Monday. Last week the Club held a meeting at the Great Northern Hotel, Leeds, when a discussion on motoring reminiscences took place. Mr. H. A. Jones (Bradford) detailed some experiences with a motor-tricycle during last summer, in the course of which he covered a distance of 6,000 miles. Once, when returning from Scarborough to Bradford, via Wensleydale, he had a leaky petrol tank, and had to try twenty-seven shops before he found a man willing to use a soldering iron. In the course of this trip he alighted and led scores of horses, and was only thanked five times. Mr. F. Beevers (Leeds), Mr. E. Watson (Leeds), and Mr. Farnell also joined in the discussion, and Mr. R. Winn (Leeds) recalled a journey on the Great North Road with a machine which he specified as being of "three cat power." He related his experiences in driving a motor-car from Larne, near Belfast, over the mountains to Giant's Causeway. On that occasion it was no unusual thing to see three or four men hanging on to the head of one horse when the car was sighted several hundred yards distant. The principal vehicular traffic was for the conveyance of peat moss litter, and frequently the horse turned the cart upside down. In returning by the coast route, the inhabitants of the country towns turned out *en masse*, and whenever the car was stopped it was simply besieged.

The County Councils and Automobillism.

THE Executive Council of the County Councils Association have considered the report of the deputation appointed to wait upon the President of the Local Government Board in regard to the regulations affecting light locomotives, and have adopted the following resolutions suggested by the deputation:— (1) As to identification the Executive Council do not desire to confine their recommendations to the requirement of a number if a name or any other means of identification, day and night, be thought desirable; but they suggest that the Local Government Board, by means of a departmental committee or otherwise, should obtain full information to enable them to decide what particular form of identification should be adopted. (2) The Executive Council consider that the suggestion made by the President of the Local Government Board to give increased authority to the police in regard to traffic throughout the country is a very valuable one. (3) That the Executive Council consider that the penalty for furious driving should be raised, in the case of a second conviction, to a fine of £50, and that the court should have the option of passing a sentence of imprisonment.

In the House.

WHY Mr. Wason, who represents the Orkney and Shetland Islands in the House of Commons, should feel interested in the traffic on the Bayswater Road, London, we do not know. But evidently he has recognised it as part of his duty as a legislator to take an interest in the matter, with the result

that the other evening he asked the Secretary of State for the Home Department whether he was aware that several motors (presumably vehicles fitted with motors) were racing last Sunday afternoon in the Bayswater Road; and if the Government would inquire into the best method of taking the necessary steps to enable such offenders to be prosecuted. Mr. Ritchie replied to the effect that he had a note from his hon. friend stating that such racing took place, but beyond that he had no information; and in the absence of further details or identification of the alleged offenders he did not think anything could be done. Such an answer should satisfy everybody, and the inhabitants of the Orkneys and Shetlands will feel that their representative takes no mere local view of his duties.

Electrical Vehicles.

IN connection with the trial of electrical vehicles to be held during the present year it has been decided that no official meter reading shall be taken, except on the last day of the trials, on which occasion recuperation trials will be included in the programme. The judges will be instructed that the system of control shall form an integral part of the basis on which judgment is given, and that they should take note of the general accessibility of the parts of the car, with special reference to the batteries and methods of charging.

Glasgow to London.

MOST of the suggestions of the western section of the Scottish Automobile Club for the Glasgow to London trial in connection with the forthcoming Exhibition at the Agricultural Hall have been approved by the Automobile Club, and the hon. secretary, Mr. R. J. Smith, will be pleased to hear from intending entrants. There will be a maximum number of marks for the run, and one mark will be deducted for every minute during which the vehicle is at rest from the time of starting to the conclusion of the run, except for compulsory stops, traffic, and accidental detours.

The Automobile Club of America.

THE annual dinner of the Automobile Club of America, which has just been held in New York, proved to be one of the most important functions so far held in connection with the automobile movement in the United States. The banquet was spread in the Astor gallery of the Waldorf-Astoria, and though that famous hostelry has been the scene of many brilliant feasts that arranged in honour of the self-moving carriage was quite as notable in its distinctive character as any of them. The scene was, above all, impressive because of the *personnel* of the diners, and the tone of earnestness pervading was fraught with a significance that led the fancy flickering through a wonderland of possibilities for the future. Of peculiar interest to the speculative mind was the address of Professor Elihu Thomson, who spoke on the scope and influence of the automobile, and developed a glowing verbal picture of the beneficent influence for posterity that is being wrought through the motor carriage. Every owner and driver of an automobile, he said, must become something of a practical engineer and mechanic in the course of his experiences. Lay minds unfamiliar with such things are

everywhere being taught to grasp mechanical and engineering propositions, in the simpler forms at first, of course; but this era of general familiarity with the field of machinery and engines would be as a growing instinct that will be perpetuated in the mentality of future generations. Professor Thomson made a hit in closing by saying that, while he did not expect the horse to disappear from the highways, he thought the day would come when the horse would be fined or taxed for damaging the roads.

Signor Marconi.

AMONG those present at the dinner was Signor Marconi, of wireless telegraphy fame. On being called upon to address the gathering he remarked that he owns two automobiles, a motor-car and a motor-cycle. "I bought them because I thought I might apply wireless telegraphy. On my motor-car I have a wireless telegraphing mechanism, and already have been able to carry on communication with my base at a distance of thirty

[Motor World.]

miles. I think wireless telegraphy would be very useful on an automobile in case of a breakdown, when you might be able to telegraph to your wife that you would be late for dinner. I once had a breakdown, and it was on the occasion of my being chased by English policemen. In that case I was able to communicate with my friends and arrange with them to bail me out when I was captured. But, of course, the wireless telegraph as applied to automobiles is intended for military service, and we hope yet to be able to keep up communication for distances much greater than thirty miles."

Motor Servants.

LAST week we mentioned that a Committee of the Automobile Club had been suggested to consider the training of servants for motor-car owners. This will probably consist of Lord Edward Churchill, the Hon. Leopold Canning, Lieut. W. Windham, Major Houghton Gastrell, Messrs. O. H. Bayldon, R. Elliott, Carew Gibson, F. P. S. Harris, Killingworth Hedges, Basil Joy, E. Kenealy, Dove Keighley, Bertrand Roberts, and J. B. Siddeley. Hitherto there has been difficulty in finding efficient men to act as drivers of privately-owned cars, and it is thought that some system of training should be adopted. The matter has received some attention in the correspondence lately going on in our columns as to the cost of maintenance of a motor-car, and doubtless the experiences of those who have engaged servants of this kind will be useful to the Committee.

The Exhibition.

LESS than three weeks now remain before the opening of the Automobile Club's Exhibition at the Agricultural Hall—the seventh of the series of motor-car displays organised at that convenient locale by the conductor of this *Journal*, the first having taken place in 1896, before the Light Locomotive Act was passed. From what has previously been written, readers are already aware of the thoroughly representative and international character of the Exhibition. Suffice it now to say, that we are confident that the exhibitors will have their stands fully occupied on the opening day—April 19th—and that the attendance will prove a record one.

The 1903 Exhibition.

As in preceding years, we take an early opportunity of announcing the succeeding Exhibition. For, as is well known, these displays have to be arranged a long time beforehand, and in accordance with the resolution of manufacturers and agents, passed at a meeting at the Automobile Club on June 11th, 1901, the Agricultural Hall has long been booked for the 1903 Exhibition, many intending exhibitors having already taken space. Having in view the highly successful Exhibition of 1901, the manufacturers were doubtless wise in their decision: certainly it is one which, having been come to by an unanimous vote, the promoter has endeavoured to fully carry out, recognising that such a coincidence of view was in the interest of the industry. Hence, it will be of general interest to note that the eighth of the series of Annual Exhibitions at the Agricultural Hall will be held in the month of March, 1903.

A Curious Coincidence.

WE understand that various promoters of cycle and other exhibitions have since suggested that the Crystal Palace, Earl's Court, and similar places might well be utilised for the purpose of an exhibition. In fact, such a display has recently been attempted at Sydenham, but the dampness of the grounds, and the chill air of February sent the visitors within the Palace to gaze only upon a small collection of automobiles arranged in a part of the nave. From reports in various journals the exhibition did not appear to have been received with enthusiasm. A meeting has recently been held, at which a committee was appointed to consider the question of holding an exhibition at the end of January, or the beginning of February, 1903—a date curiously coinciding with a printed circular, in which a repetition of the recent Palace Show was suggested from January 30th to February 7th, 1903. Evidently this coincidence must have been overlooked by the majority of those present.

Consistency.

UNDOUBTEDLY, as Mr. Roger Wallace rightly pointed out, some inconsistency has been shown by those who, in adopting a certain resolution on June 11th last year, committed Mr. Cordingley to making a contract for the 1903 Exhibition, and then proposed a few months later a date coinciding with that of another exhibition. At the same time, we would point out that no growing industry can be confined to narrow limits or legislated for by a body whose chief work should be of a social and propaganda character. Already the promoter of the Agricultural Hall Exhibition has handed £400 to the Automobile Club; another £200 will be given at the close of the present show; while about £1,500 has been lost by him owing to an honourable endorsement of the policy suggested by manufacturers. Whether the plan of maternal government can be maintained remains to be seen. Certainly the evolution of the exhibition question will be watched with interest; and a good show at the Agricultural Hall in March, 1903, anticipated.

Roads.

ELSEWHERE we draw attention to a suggestion that the Local Government Board should have some right of supervision with regard to the main highways of the country. This proposal seems well calculated to help automobilism, by giving us suitable road surfaces from one end of England to the other, instead of the present alternating lengths of good and bad roads which are now met with in changing frequency. Our "Correspondence" columns are open to suggestions from interested readers on the point.

Speed Trials.

RECENTLY the Duke of Portland offered to make easy the speed trials of motorists on his Welbeck estate, and now Lord de la Warr's trustees have made a suggestion which will doubtless be appreciated by motorists. It is to the effect that the cycle track at Bexhill should be lengthened, so as to give a straight kilometre, and that the surface should be hardened to correspond with that of the road. This is estimated to cost £500, and the Automobile Club has been given the option of holding speed trials on this track for three years on payment of £400 during the period. Probably entry fees for speed trials would go far to make up the annual expense. Meanwhile an effort will be made to raise a guarantee fund, towards which Mr. Mark Mayhew, L.C.C., has already promised £20 a year for three years.

Automobiles in Society.

LAST week we gave the names of some leading patrons of the Covent Garden opera season who are keen motorists, and expressed the hope that they would use their motor-vehicles when attending the performances. The other day, on the occasion of the King's first Court, several automobiles were espied outside Buckingham Palace; and among those who drove there in electrical vehicles supplied by the City and Suburban Electric Carriage Company, were Lady de Grey and Lady Juliet Lowther, Lady Gosford and her daughter, Lady Wimborne, and Lady Lilian Wemyss. We are always glad to hear of the use of the automobile at Society functions, and to chronicle such news for the benefit of the industry.

Easter Experiences Wanted.

PROVIDED Easter weather proves kindly, there should be many touring parties on the road during the next few days. Doubtless some motorists will go along new routes and unfamiliar ways. We shall be glad to have itineraries of interesting tours suggested by Easter experiences, particularly where the condition of the road surface is also given. Some of the members of the Midland Automobile Club are going to North Wales, and others to Gloucestershire—both of which districts should provide excellent opportunities for amateur photographers as well as expert motorists. The results obtained by the former and the experiences enjoyed by the latter should prove of interest to a wider circle beyond their own immediate friends.

Consideration of Sentences.

It is clear that the absurd fines which have been inflicted on motorists by many magistrates have been regarded with concern by those in high authority. At length the Home Secretary has promised to give careful consideration to any application for a reduction of sentence which may be made to him in particular cases. It was hoped by the Automobile Club that he would see his way to exercise a more general supervision over motor-car cases. This appears to be impossible; hence motorists will be thankful for the small mercy now open to them.

Fruit Growers and Motor-Cars.

A MEETING has been held in London to consider a proposal made to fruit growers and salesmen doing business at Covent Garden market that a service of automobiles should be established for the conveyance of fruit from the country to London. The suggestion made for the formation of a syndicate for the purpose did not apparently find much favour, although all seemed to agree that the motor vehicles could render efficient service to both growers and sellers. In this development lies much of the future promise of the automobile industry, but we hope nothing on a large scale will be attempted until preliminary experiments have demonstrated the possibility of financial as well as mechanical success.

The Lincolnshire Automobile Club.

ON Saturday the annual dinner of the Lincolnshire Automobile Club was held at the Saracen's Head Hotel, Lincoln. Mr. C. H. Seeley, M.P., presided, supported by most of the members, and Messrs. Mark Mayhew, J. E. Hutton, R. B. Bruce, and C. Johnson attended from London. Mr. C. W. Pennell, in proposing "The Houses of Parliament," advocated the standardisation of the highways. It would be a simple matter for the Local Government Board to send instructions to the local authorities as to how to mend roads, for, at present, nine out of every ten of the local authorities were ignorant of the subject. In responding, Mr. Seeley said the law which applied to horses and people generally who used the roads, that a man should not drive or do anything to the danger of the public, would be a better law with regard to motorists than that now applied, and he would leave it to the magistrates and the authorities generally to decide, subject to the general law and the general observance of it, what was not and what was a public danger.

Photo by] OFF FOR THE EASTER TOUR. [Mr. T. B. Percy.

Accidental Death.

CORONERS' juries are exhibiting more common sense than occupants of the magisterial bench. The other day Mr. E. J. Clarke, the manager of the Hart Accumulator Company, was driving his motor-car along the High Street, Stratford, at a speed of not more than three miles an hour. At the top of Marshgate Lane was a watchman's box, and as Mr. Clarke neared the corner the watchman stepped out to do something to the fire in front of the box. Unfortunately the front wheel of the car struck him, with the result that the vehicle swung round and the man sustained a compound fracture of the right leg.

After a few days the leg had to be amputated, but the deceased died on the following day from heart failure brought on by exhaustion. The jury returned a verdict of "accidental death," and the foreman added that they did not think any blame could be attached to the driver of the motor-car, as they had no doubt the man stepped out in front of it.

Cost of Maintenance.

A "MOTORIST" who wrote recording the annual cost of his motor-car and the high wages paid to his man replies to the shoal of letters with which we have been favoured—and which is not yet finished, judging from the number to hand at the moment of going to press. The figures he gave were really too superlative in character to be correct for one car, but their publication has done good in eliciting much useful information, and Mr. Estcourt's contribution to the discussion is on very practical lines. Perhaps other owners of cars will compare their yearly expenditure with the estimate he gives—an estimate, it must be remembered, based on a very long mileage, for Mr. Estcourt is no fair-weather motorist, but may often be seen on the roads of the East Coast enjoying the bleakest weather from behind the shelter of the stylish front with which he has fitted his car. In all these matters, however, the cost of tyres stands out too prominently, and the tyre question is a large factor in considering the cost of motor-car maintenance.

Gradients Wanted.

ALTHOUGH most cars can now get up ordinary hills there are many that are not sufficiently powered to ascend some of the steeper gradients met with in different parts of the country. It would be well if motorists knew the location of some of these difficult hills so that they might avoid such roads if their vehicle is unable to traverse extraordinary gradients. Near Norwich is the Gas House Hill with an average gradient of about one in seven and a-half, sections of the hill being—according to the City Engineer—one in five. Until the other day only a 50 h.p. Napier had ascended the Gas House Hill, but now it shares that distinction with a Locomobile, on which Mr. H. W. Egerton has driven up the hill, taking a passenger on his car.

Will Americans Race in Europe?

MESSRS. W. K. VANDERBILT, JUN., and D. W. Bishop have arrived in Paris, and from American sources we learn that their presence is not wholly unassociated with the forthcoming automobile contests on the Continent. Although it was announced that Mr. Vanderbilt was simply going abroad with his wife to enjoy an automobile tour, it is generally believed that his main purpose is to prepare for some of the big road contests. Mr. Bishop has indeed admitted to an interviewer that he might participate in the racing events abroad. Mr. Vanderbilt has since visited Cannstatt, to secure a powerful new Daimler machine which was ordered some time ago. This car is comparatively light, which, in view of the weight limit that has been placed on carriages entering the foreign road races, lends additional colour to the story as to participating in the races. The carriage weighs about a ton, and, it is said, has a motor developing 55 h.p.

The Collection of Refuse.

LAST week we referred to the utility of motor traction in connection with municipal street cleaning. Reference has since been made to the subject by Mr. H. Percy Boulnois in a lecture before the Sanitary Institute, in the course of which he pointed out that 1,000 tons of Paddington refuse consisted of 566 tons of ashes, 288 tons of cinders, animal and vegetable material 142 tons, broken pottery 29 tons, coal 51½, bones 2½, rags 4½,

old metal 3½, and glass 5½ tons. For England and Wales, exclusive of rural districts, there was about 6½ million tons, or a quarter-ton per head of the population, to be got rid of during the year. In the collection of this material motor traction was being more and more employed, and Singapore was one of the latest towns to use a steam-wagon in place of the too well-known cart with its flapping tarpaulin cover, allowing dust to blow all over the street. Towns on the coast sent their refuse out to sea, but the lighter constituents floated, and it was said that Liverpool dust sometimes defiled the shores of Wales, while dead animals had been heard of floating for weeks. The real solution was to burn it in destructors. And the simplest way to get the refuse to the destructors is undoubtedly the employment of heavy motor-vehicles, a department of the industry in which British makers undoubtedly take the lead.

THE Roadway Autocar Company, Limited, are removing from 44, Berners Street, W., to Burwood Works, Burwood Place, Edgware Road, W., near the Marble Arch.

NIAGARA IN LONDON will be ready for its display of electrical carriages at the end of April, when the City and Suburban Company hope to increase their present rate of sales, which, we understand are now ten carriages a week.

QUITE a number of notable motorists are just now at Monte Carlo, among them being the Duke of Abruzzes, the Grand Duchess of Mecklenburg, the Duke of Manchester, Princess Hohenlohe, the Duke de Braganza, Baron de Born, and Baron de T'Serclaes.

ACCORDING to a paragraph in *Le Vélo*, only three automobiles have so far been received at the Mont-de-Piété, the municipal pawnshop of Paris. The amount advanced on such vehicles is in proportion to their probable value eighteen months from date, when, if they have not been redeemed, they are placed on sale.

THE steamships "Anjou" and "Benie" have arrived in the Thames, from Paris, with M. Santos Dumont's airship and belongings. Mr. Theophilus Williams has challenged M. Dumont to an airship race at Chicago prior to the contests which are to be held at the St. Louis exhibition.

THE folly of introducing dangerous acts into motor-car exhibitions has been demonstrated by a very serious accident which occurred at Indianapolis a few days ago, when an automobile containing two men ran off the steep incline which had been constructed for goat-like feats in grade climbing, and crashed to the floor below with its human burden, breaking bones and otherwise injuring the occupants. The only place for such feats is out of doors on the road or in a suitable enclosure.

SIX cars were entered for the Automobile Club's quarterly 100-mile trial on Tuesday, of which five put in an appearance, viz., a 12-h.p. Gladiator, a Dechamps car, a Rochet, a Baby Peugeot, and the White steam carriage. The results of the trials are not to hand at the time of going to press, which we have to do this week somewhat earlier than usual owing to the Easter holidays.

THE efforts to start a motor cycling club for Dublin have developed far beyond the original idea. At the adjourned meeting held on Friday, last week, it was unanimously agreed to call the new association of motor-cycle riders "The Motor Cycle Union of Ireland." The outcome of the proceedings was that the skeleton framework of the new bye-laws was prepared, one or two of the new regulations for the government of the Union being left to the committee for final approval.

A CONSUMPTION trial was held near Brussels last week, under the auspices of the Belgian Automobile Club, the route covering a distance of 50 kilometres (31¼ miles). In Class 1 (cars weighing over 1,000 kilogs.), Pirmez on a 10 h.p. Delahaye was the winner, his consumption of petrol being 6.340 litres. In Class 2 (cars weighing 650 to 1,000 kilogs.), the best result was obtained by Hubert on a 16 h.p. Pipe, the consumption being 9.640 litres. In light cars weighing between 400 and 650 kilogs. (Class 3) Mathieu was first on a 6 h.p. Delin with only 2.600 litres consumption.

THE ROCHET-SCHNEIDER LIGHT CAR.

THE vehicles of the firm of **Rochet-Schneider**, of Lyons, although they have been on the market for quite a number of years, have been especially conspicuous in the public eye since the "Nice week" of last year, when they shared honours with the Mercedes and Serpollet vehicles. The firm have recently introduced a new light car, of which we are now able to publish a description together with illustrations.

FIG. 1.—THE ROCHET-SCHNEIDER LIGHT CAR.

The frame of the car is rectangular in form and of composite construction, the sides of the rectangle being reinforced at the corners by forged angle braces, with brackets for the springs. Inside the main rectangle is a second frame of sectional steel consisting of two longitudinal pieces at a lower level than the main frame, on which the motor and the variable gear are mounted. The form of the frame is such that any type of body may be attached to it without difficulty.

The motor (Fig. 3) has two vertical cylinders, the pistons acting on a single crank shaft; at a normal speed of 800 revolutions per minute it develops 8 h.p. The admission valves are automatic; they are readily accessible by removing a single clamping bar or yoke without loosening any of the pipe connections. The valve seats are large, and also the lift of the valves

FIG. 2.—FRAME OF ROCHET-SCHNEIDER LIGHT CAR.

is considerable, to prevent an undue speed of the incoming charge in the valve passages. The exhaust valves, operated by cams formed integral with the cam shaft, are also dimensioned very liberally, and are made accessible by removing the threaded caps covering them. The explosive charge is derived from a double spray carburettor. In this apparatus, specially designed by the firm, the jet of petrol is sprayed directly in the admission tube, which makes it exceptionally simple; there is no pre-heating of the mixture in this device; it has two auxiliary air intakes which can be regulated, but they require this only for relatively large variations in temperature. The centrifugal governor is

located in the gear wheels of the cam shaft; it acts on a conical sleeve, which it displaces more or less on the cam shaft. On this sleeve, which turns with the shaft, rests a conical roller at the end of a lever which communicates its oscillating motion to the disengaging shaft running the whole width of the two cylinders. This shaft carries opposite each exhaust valve a lever, which acts through the intermediary of a short link, preventing the lifting of the valve when the governor acts to reduce the motor speed. This motion is very rapid and may take place at any position of the valve. If the knife edges are not in the position of disengagement the motion is taken up by a spring which gives it out again at the following revolution. This arrangement permits the regulation of the cylinders at will. Both may be thrown out of action at once or each singly. A foot "accelerator" is fitted in connection with the governor, so that the speed of the engine can be varied at will. The ignition is electrical, while the water circulation is maintained by a pump and radiator, the latter being somewhat on the lines of that used in the Mercedes car.

Coming now to the transmission, four speeds forward and a reverse motion are provided. The power of the engine is trans-

FIG. 3.—THE ROCHET-SCHNEIDER 8 H.P. MOTOR.

mitted to the speed changing gear by means of a conical friction clutch, the clutch surfaces of which are lined with leather. The cone, which has been very liberally dimensioned, in order to avoid all slipping and abnormal wear, enters into a conical opening of the flywheel under the pressure of a coiled spring on the square shaft to which the cone is fixed and on which the pinions of the change gear slide. The spring is so arranged that it can easily be replaced by another one when necessary, without dismounting any part of the change speed gear. All the speed changes are obtained by means of a single lever, which works on a notched sector and operates on the set of spur pinions, which it displaces on their square shaft in such a manner as to bring one of the pinions opposite the fixed gear, to which it corresponds. A special arrangement permits, when the movable pinions are returned to the neutral position, to obtain the reversal of the transmission of motion and consequently a backward speed by means of the low-speed gear and pinion. The speed reductions are so calculated that all ordinary grades can be mounted on the gear which is most advantageous on the level. The extreme ratio is $4\frac{1}{2}$; that is, the gear reduction of the fourth speed is $4\frac{1}{2}$ times greater than on the first. The reverse speed is still lower—only three-fourths of the slowest forward. All the gears run in an aluminium casing filled with oil. The differential

MOTOR-CYCLE TROUBLES.

shaft runs in bronze bushings. The bevel wheels of the differential communicate their motion to the sprocket pinions by means of a through shaft on the one hand and a sleeve on the other. Any deformations of the frame are compensated for by spherical bearing seats. The supports for these bearings are forged in one piece with the spring brackets, the lugs to which the chain adjusters are fastened and the brackets for supporting the rear wheel brake shafts. The sprocket pinions are fitted on a square portion of their shafts, the makers claiming that they are much easier to remove than when fitted on to tapered shafts.

The steering is controlled by an inclined hand wheel; it is irreversible and consists of a strong screw with several threads acting on a nut pivoted at the end of a lever, which communicates its motion to the swivelled axles of the steering gear. The vehicle is fitted with three brakes. One acts on the differential gear and is operated by a pedal, while a hand lever controls band-brakes on each of the rear road wheels, and it may be mentioned that on the application of either brake the first action is to with-

FIG. 4.—THE ROCHET-SCHNEIDER CHANGE-SPEED GEAR

draw the clutch and so throw the motor out of gear. The brake on the differential is of large dimensions, completely metallic, and holding with great force whether the car is running forwards or backwards. The rear wheel brakes consist of wide steel bands lined with "camel's hair," and are also double acting. In order to avoid any inequality in the action on the two wheels, which is often the cause of accidents, an equalising device is introduced in the brake-operating mechanism, which makes the torsion of both the brake shafts exactly alike. The road wheels are of the artillery type, all being $31\frac{1}{2}$ in. in diameter and shod with 90 mm. Michelin pneumatic tires. The car complete, with tonneau body, weighs about 12 cwt.; it can, it is claimed, ascend any ordinary hill, and can attain a speed on the level of 25 to 30 miles per hour.

The Rochet-Schneider Company are also building a four-cylinder car of 12 h.p. Arrangements for introducing both types on to the English market are, we understand, at present in hand.

FOR every time a motor-cycle goes wrong—even in the most insignificant detail—there may be a score of occasions when it is beyond criticism. Nevertheless, the one troublesome occasion will vastly outweigh the twenty enjoyable ones in the mind of the rider. The latter are rarely thought of, scarcely ever dwelt upon. The owner of a machine may ride fifty or one hundred miles without a hitch, and think nothing of it; but let one thing go wrong and he will frequently remember only it, and wonder why he ever had anything to do with such an unreliable "contraption." This state of chronic fault-finding is inseparable from all new things. When the safety bicycle became popular, when the pneumatic tyre put in an appearance, and so on down the scale, the same disposition to find fault on all occasions was observable. But as every improvement connected with the bicycle had to run the same gauntlet of criticism, so each and all of them finally outlived it. It will be so with the motor-cycle. The disposition to throw up one's hands in mingled horror and resignation every time the mixture is wrong, the sparking is not regular, or the belt slips, will ultimately disappear. The more a rider uses a motor-cycle the better he will understand it, and know how to use it and take care of it, that is, provided he has some glimmering of mechanical knowledge. If he is without this, however, it were far better that he never crossed the saddle of a mechanically-propelled bicycle. For it is a fact, and it might as well be understood at the outset, that the rider who would not know how to screw up a nut if he attacked it wrench in hand—and there are not a few of this type of person still about—has no business with a motor-cycle. It may be said for the motor-cycle, however, that even at this early stage of the movement there is a very marked lessening in the number of troubles encountered. If only ordinary care is taken it is not necessary to start out on a motor-cycle run with the fear constantly in one's mind that the return journey will be made by train or on foot. It is quite possible even now to come through a run without a mishap of any kind, and the chances of immunity from trouble will become greater as the months go by.

THE Warwick Tyre Company have for some time been experimenting with tyres for motor-bicycles, and are now in a position to supply a tyre which they claim is particularly suitable for use on such machines. The driving wheel tyre is built up with two layers of fabric vulcanised together.

THOSE who visited the motor-car exhibition in the Grand Palais, Paris, would hardly recognise the interior of the building this week, for the horse show, which is the social event of Paris, is at present being held in it. The ground floor has been converted into a large arena, around which are seats, with accommodation for 6,000 people, while the cellars, where the alcohol motors were located, have been converted into stables.

AMERICAN motor-car papers chronicle as a matter of exceptional novelty the fact that a race between a horse and an automobile will take place at Albany in the summer. There is nothing so remarkable in the idea. Two years ago there was much talk about a similar contest, in which Mr. Mark Mayhew's car was to figure as a competitor. A race between a trotting-horse and an automobile actually took place in the Deer Park, Richmond, in 1899, with Mr. C. Jarrott mounted on the latter. On this occasion, at least, the old country was in advance of the newer nation.

MESSRS. GUEST AND SON, of Neptune Works, Sheffield, have just brought out an excellent tyre-repairing outfit for motor-cars and cycles. The box, which measures 6 in. by 3 in. by $1\frac{1}{2}$ in., contains a square of rubber, covered with canvas, a square of ordinary canvas, a strip of canvas-covered rubber for outer covers, half a dozen canvas-covered patches of various sizes, four spare valve-tubes, piece of glass-paper, large tube of excellent solution and a tin of chalk, to say nothing of ample directions. It is a most useful outfit, and one which should be in the possession of all users of cars fitted with pneumatic tyres.

Mechanical Flight Up-to-Date.*

By SIDNEY H. HOLLANDS.

CHAPTER VI.—AERIAL PROPELLERS.

THAT the screw or helical propeller should have been associated with aerial navigation no less than four centuries ago is a remarkable fact enough (see Chap. I., L. Da Vinci), but that such use should have anticipated its application to aquatic propulsion by over three centuries is still more so. Ships—of a kind—the ancients had with them always, but flying machines, or any approach to them, they had not—not even that “unfortunate invention” the balloon.

The more honour, then, to the memory of a man some centuries ahead of his time—the great painter-mechanician whose

original conception it was. Archimedes of Syracuse cannot be credited with this application, as he used the screw only as a conveyor, or water-lifting device, not as a propeller, aerial or otherwise. The screw or helix, however, is but one of at least three—perhaps eventually four—practicable forms of aerial propeller. As there is a sort of general notion with some readers that a “propeller” is necessarily a screw, I have thought it expedient to draw attention to this fact at the outset.

The three means of aerial propulsion I now purpose dealing with herein, are (1) the screw or helix; (2) the flapping wing, approximating more or less nearly in its variants to natural bird-flight; and (3) the “wave-action” membrane, which, though involving a flapping motion, is distinct from ordinary wing-action. Passive propellers, *e.g.*, the aspiring aerocurve, I am not now dealing with, having previously dealt with “aspiration” and passive flight to some extent. All forms of feathering paddle-wheels are also excluded as being considered quite impracticable for several reasons. This latter form of propeller, by the way, is now practically extinct in ocean-going steamers, being displaced by the handier, simpler, and less cumbrous screw-propeller, in spite of the fact that it pioneered in steam navigation, and had the field to itself for many years—another instance of the survival of the fittest.

To deal first with aerial screw-propellers from the beginning. That of Leonardo Da Vinci was a screw of a single thread or “worm,” of which the modern equivalent would be a one-bladed screw; but as “blades” were a much later development, this screw comprised an entire convolution, or nearly so, the skeleton of the helix being formed of stout iron wire coiled around and stayed from a central axial-rod, or shaft, by radial stays at intervals, and covered with varnished linen (Fig. 1). Now one can quite understand how the original screw-propeller came to

be of single “worm” type, and the fact of one complete turn of the coil (continuous “blades”) being deemed essential, also the absence of a central body or “hub.” These were matters of subsequent development, the departures being indicated by experiment. It was first discovered by actual comparative trials that half a convolution of the “worm” was fully as efficient as a whole turn; then, that a quarter-turn was more efficient than half, but that with this curtailment of the helix, a formidable difficulty arose, particularly when rotating at any speed; it had now developed into a one-bladed screw, was unsymmetrical, and consequently unbalanced. Centrifugal force and unbalanced thrust now jointly interposed and said “no go” (Fig. 2).

Some hard thinking had now to be done. By and bye it dawned on the minds of the pioneers that the expedient to produce a symmetrical, efficient, and compact screw-propeller, while employing only a fraction of a convolution, was to have two or more threads. Thus it gradually came about that the modern true screw-propeller in its simplest and most efficient type is but a very short length cut off a two-thread screw, in which the “thread” is relatively very deep, *i.e.*, occupying the major part of the diameter, and the “pitch” equal to about two-thirds of the diameter. A marked later tendency was to err on the side of plurality of blades. Thus the “Ericsson” propeller (marine) was formed of a short section of a twelve-bladed screw, and was, naturally, found to be very inefficient. The aerial fan-propeller (not a true screw) of Moy had six blades or vanes (Fig. 3), and I believe, left much to be desired. The same applies to Henson’s propeller (Fig. 4), also to those of Du Temple and others. Even the first propeller-fans used by Prof. Langley on his original model machine were six-bladed. In his subsequent, and highly-successful, machine, the “aerodrome,” the twin-propellers were two-bladed true screws, as were also those of the Maxim machine (Fig. 5). It is a significant fact that in those experiments with flying apparatus using motors and rotating propellers the conspicuous successes have all been attained with two-bladed

screws or fans; indeed, it may now be safely stated, for the guidance of future experimenters, that it is not worth while again trying any form of multi-bladed propeller. All recent systematic and comparative experiment points to the fact that a two-bladed propeller is the most efficient, and at the same time, fortunately, the simplest and lightest. I may be allowed to add that the results of my own experiments enable me to endorse that fact. That is definite and satisfactory so far.

It cannot, however, be as definitely, or as confidently stated that a true screw is the most efficient form for a rotating aerial propeller. My experience, for one, is at variance with such a conclusion. That which is best in the water is by no means necessarily best in the air, and *vice versa*. We may safely predict that an aquatic propeller made with concave blades would be a conspicuous failure; yet in an aerial propeller with blades so formed I registered the highest efficiency compared with several other types, including true screws. Moreover, I found that

* All rights reserved.

further considerable advantage accrued from making the blades narrow at the tips, which also further tends to lightness and stiffness (Fig. 6). As I used very thin sheet steel for these blades, the slight concavity of the driving side added greatly, and very serviceably, to their stiffness; in fact, if these very thin metal blades had not been so stiffened by their concavity—i.e., had been flat—I could not have used them at all, as they would have flapped over like strips of paper.

Although I am now relating my experience—"a labour of love," as it is called—freely giving its results, I do this in the interests of the cause, for the promotion of aeronautics, but claim entire originality both for the type of propeller just described and illustrated and for the motors described and illustrated in the previous chapter. All these I designed over ten years ago. Referring to another type of propeller-fan—namely, the flexible-bladed fan—which is one so constructed as to give a self-feathering action to the blades, i.e., a self-varying pitch, the resistance to rotation causing the blades to twist, and so to become of less and less pitch with increasing speed (Fig. 7). This type has found some advocates, but is by no means efficient; experiments have indicated great loss of power. For my part, such a result seems obvious, and needs no trial. Mr. Thaddeus Hyatt, an experimenter of New York, tested such a fan, three-bladed, and of 19 in. diameter. At 480 revolutions per minute the thrust was only 3 ozs.! The last-named is another type of propeller that it is not worth while experimenting with further. "The normal status of propelling (as well as of "sustaining") surfaces should be the position of maximum efficiency." This is a sound rule in aerial machine design, and its observance disqualifies the class of fan last described.

(To be continued.)

THE "BRUTUS" MOTOR-BICYCLE.

THE "Brutus" is the name given to a new bicycle motor lately introduced by M. L. Leclercq, of 23, Rue Jermain Pilot, Paris. The motor is made in two sizes—1½ h.p. and 1¼ h.p.—weighing respectively 17 lbs. and 24 lbs. It is adapted to be fitted in a vertical position in the frame (as shown

in the illustration), a twisted strap and jockey pulley being used to convey the power to a light metal pulley attached to the rear wheel. A spray type of carburettor is used, the petrol being contained in a tank carried behind the saddle.

THE Portsmouth and Gosport Motors, Limited, are opening a garage at Portsmouth.

THE Sirdar Rubber Company, Limited, are at present altering large numbers of wheels from the "pinched-on" style to the "Buffer" principle.

THE Automobile Club of America announces that it will hold another endurance run next autumn. The rules governing it will be more strict than those of the New York-Buffalo run last year.

FLOTSAM AND JETSAM.

BY "FLANEUR."

A FEW weeks ago I ventured to remark that the ways of Government departments were not always easy to understand. This was in connection with the issue of a licence for my car, the document, it may be remembered, being described as applicable to a four-wheeled vehicle drawn by two or more horses or mules, or drawn or propelled by mechanical power, while a curiously contradictory footnote declared that the licence was "not applicable to a carriage which is a light locomotive as defined by the Locomotives on Highways Act, 1896."

I HAD put myself in communication with the Board of Inland Revenue just before I referred to the matter in print, and in the course of a few days received a letter which in its turn propounded a question—as to the weight of my car, to wit. I informed the Board that the latter was under one ton. Two or three weeks later I received another letter, formally stating that the matter was being enquired into. Apparently it takes a good deal of enquiry, for from that time to this I have heard nothing more about it, and the mystery is as great as ever. Meanwhile a kind correspondent, whose letter was published in the *Journal*, has stated that the licence for cars weighing less than one ton is not demanded under the Light Locomotives Act but another Act altogether. The explanation, which I should have acknowledged earlier but for the fact that I was awaiting the departmental reply, is interesting so far as it goes. But the puzzle remains—if the licence which I hold does not apply to any carriage defined as a light locomotive in the Locomotives on Highways Act, what on earth is the nature of the vehicle propelled by mechanical power to which it does apply?

THERE is still, I understand, a considerable difficulty in obtaining good workmen in the motor trade. It is to this fact, I suppose, that one occasionally becomes the victim of a bit of scamped work, or some error of omission that seems wholly inexcusable, and only to be attributed to the consummate carelessness of an individual workman, and his complete lack of interest in the work he has to do. I believe that the British workman at his best is still without a rival, though somewhat stolid and unenthusiastic. Compare, for example, the leisurely manner in which even an expert English mechanic will set about diagnosing a source of trouble in a car, as compared with the interested activity of a Frenchman. By thoroughness, however, the Englishman will often redeem himself, but when this saving grace is lacking, and he is stupid and careless alike, then one can only pity his master and his master's patrons.

Two cases of the inexcusable carelessness to which I have referred have lately come within my own experience. The first concerned a car which had not long previously been overhauled, and on which I was being driven by a friend, its owner. We had got some twenty miles or so out of town, along a well-known road, when we heard a rumbling which was strongly suggestive of dry bevels. We got down accordingly and opened the gear-box, and were confronted by a most astonishing sight. There was not a drop of oil to be seen, nor any trace of any having ever been used. The case was "bone dry," and as clean as that of a new chassis at a show; clearly it had been washed out with petrol when the car was under examination.

BUT can any reader who has ever seen the inside of a gear-box, and its cover imagine how even the most careless of mechanics could replace the lid and screw it down without previously putting in the oil? This is not one of those little things that can easily be left undone; it is a matter affecting the very vitals of the car, and one which the owner has a reasonable right to suppose has been attended to. Every now and then, of course, one examines a gear-box, both to see whether the oil requires renewing and how the

gear is wearing ; but if one must needs remove the cover on receipt of a car after overhauling, one might just as well be expected to dismantle the whole machine. There are some things one must take for granted.

It can hardly be said that the other example is much more creditable to the workman concerned. The car in this case had just been fitted with a new carburettor, and ran well for a short time ; then it suddenly stopped short, in the way that usually implies a broken wire or a choked petrol supply. The sparking plugs were found all right upon the usual testing, and on the petrol pipe being detached from the carburettor the flow from the tank was found to be uninterrupted. Eventually it was found necessary to take the carburettor to pieces. Some carburettors are easily get-at-able ; others are the reverse, and this was one of them. When finally dismantled, however, the cause of the stoppage was at once apparent. The float-chamber was lined with a considerable amount of grit, which had to be scraped off with a knife, while numerous particles were in suspension and others had worked their way along the channel to the spray and effectually choked it. The only apparent explanation of the trouble—for the petrol had been carefully filtered—was that the workman who fitted the new carburettor had been too slovenly to wipe it free of dust, and the amount of this that the float-chamber contained was appalling. Probably, like many another man, he had missed his vocation ; at coal-heaving he might have been A1.

LATER.

At the moment of going to press I have received the following letter from the Board of Inland Revenue, from which it will be seen that I was right in my contention, and that the licence certificate in its present form is wrong :—

SIR,—With reference to your letter of the 3rd ultimo, I am directed by the Board of Inland Revenue to acquaint you that the licence obtained by you is the correct one for a motor-carriage of the kind referred to.

The note at the foot of the licence is misleading, and it will be amended.—I am, Sir, your obedient servant,

AUG. H. BROWNE, Assist. Secretary.

It has taken the Somerset House officials the best part of a couple of months to discover the contradiction between the footnote and the main clauses of the certificate. There is this satisfaction left to me, however, that I have convinced them of the error, and that future issues of the certificate will not contain the stultifying footnote.

THE big trial of motor-vehicles for 1902 will probably take place in September.

AUTOMOBILE CLUB runs are contemplated as follows :—May 10th to Brighton, May 24th to Worthing ; June 21st to Folkestone, and June 28th to Eastbourne.

MOTOR-CYCLES intended to compete in the motor-cycle meeting at the Crystal Palace on Saturday, the 5th prox., should be registered before noon on that day at the Automobile Club. Motor-cycles will also be included in the Club's hill-climbing competition on May 3rd.

THE ground floor area of the new Daimler garage in Brownlow Mews, Guildford Street, W.C., is 4,200 square feet, and customers' cars can there be stored for long or short periods—a department of the automobile industry that is attaining great dimensions in France and the United States.

WE regret to learn that Captain Charles G. T. Bromfield, 87th Company Imperial Yeomanry, died of wounds received at Boshof. The deceased, who was formerly connected with Messrs. New and Mayne, and later with the defunct London Electrical Cab Company, volunteered as a trooper in the 79th Company Imperial Yeomanry Roughriders in April, 1900, but was invalided home in the following November. He returned to South Africa in March last year as a lieutenant of the 84th Company Imperial Yeomanry Roughriders, and was given his captaincy in the 87th Company in July.

THE ACCLES-DE VEULLE RADIATOR.

THE accompanying illustrations show a new form of radiating coil which has lately been introduced by Messrs. Accles and De Veulle, of Perry Bar, Birmingham. The new coil, which presents a very large surface to the air for radiation, is of novel construction. A strip of thin sheet metal

of a length sufficient for the tube to which it is to be fitted, and in width equal to its external diameter, is pierced with parallel lines of slits across its width diameter. These strips are $1\frac{1}{2}$ in. in length and $\frac{1}{8}$ in. apart, which latter distance also separates the rows of slits from each other. It will be seen that the whole surface of the metal is thus broken up into narrow strips $\frac{1}{8}$ in. wide and $1\frac{1}{2}$ in. in length. The sheets are next bent upwards from the

edges of the unpierced cross lines, and downwards across the middle of the lines of narrow strips. It is then bent round the tube and soldered to it, the bent strips opening out in the form of stars, giving free air circulation both outside and inside their surfaces. The coil is very light and strong, and at the same time distinctive in appearance. One of the illustrations depicts a radiator for a 4 h.p. engine, weighing, with unions, 7½ lbs., and comprising about 9 ft. of cooling tube. The London Autocar Company are the agents for the new radiator in the Metropolitan district.

CONTINENTAL NOTES.

BY "AUTOMAN."

M. LEON SERPOLLET has been kind enough to give me a few prints of photographs he has just taken on the road between Nice and Abbazia. Two of these photos are particularly interesting as showing the sudden change from advanced spring to mid-winter which will be experienced in crossing the Alps. The south side, it will be seen, is covered with verdure, dry, sunny, and thoroughly meridional, whereas the north side, deprived of the sun by the mountains, is covered with snow some two or three feet deep. The third view shows the plains of Lombardy, the flat rice-growing country, with the snow-covered Alps as a background. M. Serpollet is running altogether eight cars in the Nice-Abbazia race, three being of 12 h.p. each, and the remaining five of 6-h.p. All, save one, are to be run in the racing section; the remaining one—a 12 h.p.—will be driven in the tourist section by M. Serpollet himself, who for family reasons has practically given up racing. The 12-h.p. racing car weighs

CLIMBING THE SOUTHERN SLOPES OF THE ALPS. COMING DOWN THE NORTHERN SLOPES. ON THE PLAINS OF NORMANDY.

only 11½ cwt. in racing trim, without water and oil, and can accomplish nearly 180 miles without having to replenish its supply of water. This improvement is due to the new apparatus which I described in December last, and which stores the water in a sort of accumulator instead of blowing it out every time the safety valve is required to act.

LAST week I referred to the great improvements in motor-cars which may be expected this year as a direct result of the new racing rules, and I am glad to be now able to give some advance news in this direction. Messrs. Panhard and Levassor are preparing for the Nice-Abbazia-Nice race a four-cylinder car, with equal wheels, and an engine which develops 55-h.p. The motor is of the Centaur type, as is also the carburettor. This latter is a distinct type, and acts also as a regulator, in that it governs the admission of the gases. There is also a regulator on the exhaust. A great reduction in weight has been obtained by an alteration in the front springs and axle. The axle has been brought right forward under the end of the bonnet, and there is only one spring instead of two. The front axle is attached to the frame by means of this spring. Four of these cars will be run in the Nice-Abbazia-Nice race, driven respectively by Rene de Knyff, Pinson, Chauchard, and Maurice Farman. The chassis weighs only about 15 cwt., so that the car, ready for the road, will be well under the ton limit.

FOR the Paris-Vienna race Messrs. Panhard are preparing something much more powerful, but it would be indiscreet on my part to give any details on this head for the moment. To be forewarned is to be forearmed, and English makers will do well to seriously examine what is going on in France, if they do not want to find themselves again hopelessly out-distanced this summer by their French rivals. I feel quite sure that I hear already the reply which was given to me last year when I made similar remarks and gave similar warning. The wise acres said, "We do not want in England high powers, or light weights, or road racing, or any of your Continental ideas," and then they went to work to bring out a 12-h.p. car weighing 22 cwt. instead of 30 cwt. So it will be this time, and every time, until the British maker realises what I have been hammering at for a year—that he should come into the international racing field, and get up to, or beat, the foreign maker and reap the reward of international trade.

A CURIOUS point has arisen regarding the weighing of the cars for racing purposes. The new rules allow the accumulators used for ignition purposes to be taken out of the car before it is weighed, but do not provide for the case where ignition is by magneto only, so that an evident unfair advantage is given to cars which have electric ignition by accumulators over those in which the ignition is by magneto. No doubt a speedy rectification will be made in the rules, for the very spirit of the new regulations is to promote efficiency and do away with useless weight, and if the Mors firm can prove that with nothing but magneto ignition they can produce efficient results, undoubtedly the future of this ignition will be assured, and accumulators will follow burners into the shade of obscurity. In order, however, to make a fair comparison, the same advantages must be accorded to the one as to the other, and either accumulators must be taken into the calculation of weight as well as magnetos, or they must both be left out. Common justice demands it, and I believe that steps are being taken to bring the point to an issue.

FROM Metz to Paris in one day is a good run for a motor-car, as everyone will admit. Yet it has been just accomplished by Mr. Vanderbilt, who the other day brought home to Paris his new 35-h.p. Mercedes. It is not only, however, German makes that meet with Mr. Vanderbilt's favour, for I learn that he has just ordered a 15-h.p. Mors. Quite a transformation has now taken place in the works of the Mors Company; all the old models have been abandoned to make way for 8, 12, 15, 22, and 30 h.p. cars of the latest type.

ON Saturday last a banquet was given to the Marquis de Dion at the A.C.F. by a group of friends and admirers, and he was at the same time presented with a souvenir in the shape of a piece of statuary in Swedish marble by Royet. In the centre of the block is a medallion representing the bust of the Marquis, and around the medallion are grouped figures representing the motor industry, and principally a workman in his shirt sleeves holding the well-known De Dion motor in his hands. The Baron von Zuylen presided over the banquet, and made the presentation in a suitable speech, to which the Marquis replied.

ENTRIES are still coming in for the Nice-Abbazia-Nice race, and the numbers now reach the eighties. By the way, the stages have been somewhat altered from the programme which I gave last week. It has been found quite impossible to leave the cars in safety for the night at Maestre—there is no suitable place to store them, even if a high rent were to be paid, so that the second stage, on Wednesday, April 9th, will be from Turin to Padua, instead of from Turin to Verona, altogether 242 miles. On Thursday, April 10th, the day will be spent at Venice, which is only a little over twenty miles from Padua. This will be a great advantage to those who have never seen Venice, which will no doubt be *en fete* for the occasion. On the return journey, Wednesday, April 16th, will be spent in a similar manner at Turin.

THE TRANSPORT STEAM MOTOR-WAGON.

A SOUTH OF ENGLAND firm which has for some time been devoting considerable attention to the subject of heavy steam vehicles is Messrs. Jesse Ellis and Company, of the Invicta Works, Maidstone. Mr. Ellis, the managing director, has had an extensive experience with traction engines and road rollers, and this has been of much advantage in defining

FIGS. 1 AND 2.—ELEVATION AND PLAN OF TRANSPORT STEAM WAGON.

the lines on which the "Transport" steam-wagon should be constructed. The boiler, which is located in the fore part of the frame, is of the vertical water-tube type, working at a maximum steam pressure of 200 lbs. per square inch. The heating surface is 70 square feet, and the grate area 4.9 square feet. The crown of the fire-box is furnished with a fusible plug that can be easily renewed without in any way disconnecting the boiler. By means of a special feed pump any excess of water above the quantity needed for feeding the boiler can be pumped back to the tank by opening a valve; moreover, the boiler is also fitted with a reliable injector. A steam blast is available for accelerating the raising of steam, and a by-pass valve is furnished for admitting full boiler pressure to the low-pressure cylinder. The engine is of the horizontal type, having high and low pressure cylinders, four and eight inches diameter respectively, by six inches stroke, and develops 25 i.h.p. The engine drives the rear axle by means of helical gear, two speeds, three and five miles per hour,

being provided. The engine, boiler, and gear are carried on a special expansion frame, which is suspended from the upper frame by a cross elliptical frame at the forward end and by heavy coil springs at the rear, the main frame being carried in horn plates upon strong helical springs on the axles connected to the front and hind axles, all the parts being readily accessible. The leading wheels (of wood, iron tyred) are three feet in diameter, with four-inch tread; and the driving wheels are three feet six inches diameter, with a tyre width of four and a half inches. Steering is controlled by a horizontal hand-wheel; two brakes are fitted; one a band brake acting upon the engine shaft and worked by the foot, and one upon the tyres of the rear wheels of the wagon, worked by a screw. Coke or coal is used as fuel, generally the former, and sufficient can be carried for ten hours' run; the capacity of the water tanks is 120 gallons. Any type of body can be fitted to the frame, the illustration showing one suitable for millers and corn merchants. It is intended for a load of four tons, and on good roads to also draw a two-ton trailer. Messrs. Ellis have already constructed a number of these vehicles, one of which has been in use by a large firm of brewers at Maidstone for the past eighteen months with every satisfaction. At a recent trial the vehicle left Maidstone at 11.30 a.m. for Sittingbourne, about twelve miles away, over Detling Hill, up varying gradients of one in 6, 7½, and 10, for fully seven-eighths of a mile. The vehicle was loaded with fifteen barrels of beer, and other goods making up a load of, in all, over three tons. The vehicle reached its destination in three hours. On the return journey, at 3.30 p.m., unloading stoppages and calls for empties had to be made, and by 7.55 p.m., on reaching the brewery again, it was found that 1 cwt. of coal and 9½ bushels of coke had been consumed.

FIG. 3.—GENERAL VIEW OF THE TRANSPORT STEAM WAGON.

THE "B.E.C." ELECTRICAL CAR.

AS recently recorded, the British and Foreign Electric Vehicle Company, Limited, has changed its title to the British Electromobile Company, Limited. At the same time some radical changes in their electrical motor-cars have been made as a result of the experience gained with the "Powerful" car, whose exploits in the way of long runs last year have been referred to in these columns, and we are this week enabled to publish some particulars and illustrations of one of the latest vehicles. The frame is of channel steel construction. Two electrical motors are employed to drive the car, these being spring-suspended on the fixed rear axle, one at each end, pinions on the motor spindles meshing with large spur wheels connected to each of the rear road wheels, the power of the motors being thus conveyed to the wheels by a single reduction. To the top of the motors, E (Fig. 1), spiral springs, A, are fixed, these springs bearing on the brackets, B, and so taking up any thrust of the motors. The spur gearing is entirely inclosed in dust-proof oil-containing cases, T.

Passing now to the accumulators, the British Electromobile Company after many experiments has adopted the Leitner, the battery consisting of forty-two cells placed in compartments in the body of the vehicle. These receptacles are provided with hinged tops, so that the cells can be rapidly inspected or removed. The battery is adapted to be charged from mains giving a pressure of 110 volts and upwards, and has a capacity, in the 8 h.p. car, sufficient for a run of sixty miles at an average speed of twelve miles per hour on one charge. The British Electromobile Company

FIG. 1.

has gone very thoroughly into the question of recharging the batteries of electrical cars. Not only has it prepared a list of places throughout the United Kingdom where they may be recharged, but for clients in the London district it has arranged to enter into contracts to recharge as often as desired, as well as to maintain accumulators and cars at an inclusive rate per year. An interesting detail of the vehicle is the controller, C, which is now quite separate from the steering pillar, and set at a slight angle, so as to be within convenient reach of the driver. It consists of a revolving cylinder enclosed in a water-tight aluminium case, the cylinder carrying a number of contact blocks, on which press a row of stationary contact fingers. As the handle of the controller is turned, various electrical combinations are produced, with the following eight effects:—R, reverse speed; B, electric brake; S, stop; 1, first speed forward; 2, second speed forward; 3, third speed forward; 4, fourth speed forward; and 5, fifth speed forward. Each position of the handle is at an angle of 45 deg. with the next, and a simple mechanism renders it impossible to make an imperfect contact by leaving the handle in an intermediate position. The controller is adapted to be operated by the left hand of the driver, thus leaving the right hand free to control the inclined steering wheel. The connections for the recuperation of the battery are entirely outside the main controller, and are obtained by means of two pedals.

The vehicles are each equipped with three brakes—the emergency electrical brake applied through the controller, the

medium electrical brake due to recuperation, and pedal-operated band brakes on drums on the hubs of the rear road wheels. These latter brakes act equally well, be the car travelling in a forward or backward direction, and when put in action the electrical circuit is automatically broken. The road wheels are of the artillery type, and are usually shod with solid rubber tyres, the company finding these more reliable than pneumatics, which, however, they will fit if desired. Altogether the new vehicle marks a step forward in electrical carriage design, the body of light construction, reminding us very much of those found on modern petrol motor-cars.

ADJUSTING DE DION-BOUTON GEARS.

IN view of the great number of De Dion 4½-h.p. voiturettes in use, and the growing popularity of the 8-h.p. car of the same make, the following instructions for adjusting the gears, furnished us by Messrs. De Dion-Bouton, Limited, will, no doubt, be found useful by many of our readers.

To begin with the 4½-h.p. voiturette. On the right side of the gear-box, looking at the same from the back of the car, two sliding rods or racks will be seen, the upper one of which is actuated by a small pinion fixed to the chain-wheel on top of the gear-box. It is connected to the lower one by a bracket and ball bearing. The lower one slides in and out of the box, and turns four small pinions which expand or contract the clutches when the gears are changed. The rack on this rod is cut in the form of two coarse screw threads (one left and the other right) which meet in the middle. To prevent the rod turning round it has two longitudinal grooves cut in it towards the outer end, one on each side. The hollow axle in which this rod slides projects from the gear-case, and has a collar or boss at the end. A small plug or bolt passes through a hole in this collar and the hollow axle, and enters one of the grooves in the slide. (In some cars this plug is screwed into the boss and fixed by a lock-nut, and in others it is held in position by a band of steel which forms a spring clip round the collar). To remove the plug take hold of the projecting end of same with a pair of pliers and draw it out, when the spring will come with it. If the spring is forced off separately it may break. To adjust the gear place the change-speed lever on the steering columns, so that the clutches are free, remove plug in collars referred to, and turn the rod. If this cannot be turned by the fingers, a spanner applied to the nut at end of rod outside the ball bearing will easily turn it. In the majority of cars turning the top of the sleeve attached to rod towards you tightens the clutches, and away from you the reverse. A half turn is generally sufficient. Do not move the change speed handle to test adjustment until you have replaced the plug with the flattened end resting in the groove of rod. If, when the gear is properly adjusted, the change-speed handle is not central when the gear is free, this can easily be rectified. The chain which connects the wheel under the steering column with the wheel on the change-speed box has two unions, one on each side. These have right and left-hand threads, and by means of the same the length of either half of the chain can be lengthened or shortened, and the relative position of the change-speed handle altered.

In the 8-h.p. cars, of which an illustrated description was given in our last issue, the gears and method of adjustment are the same as on the voiturettes. The adjusting rack projects from the front end of the gear case, through the brake drum. The plug is held in position by a spring clip, or has a joint in it so arranged that when the top is straightened it disengages the plug from the groove in the inside rod. To tighten the clutches the rod should be turned to the right, as though screwing it into the gear-case, and to the left to slacken them. In the cars in which a jointed plug is used, give the rod about a quarter of a turn after straightening the plug, then turn the plug back, and turn the rod until the plug is heard to fall into the groove.

THE CARE OF ROADS.

WITHIN recent years the importance of roadways has gradually dawned upon the public mind, and people generally are recognising the chaotic state into which the whole question has been allowed to drift owing to the lack of responsibility which appears to prevail. In the time of the old mail-coaches it was daily brought home to central and local bodies that the state of the main arteries of traffic was a national matter; but since railways have supplanted roadways the ordinary "man in the street" has not concerned himself with the thoroughfares of the country beyond his own immediate locality. Cycling has done something to broaden the public view, and many of the county authorities have awakened to their duty and have recognised the necessity for maintaining the surface of the roads. But there are many roadways that clearly mark the division between one county and another and cause many to wonder why the main traffic ways are not under the control or supervision of one authority. This separate control of the roads leads to much confusion—not only so far as the varying road surface is concerned; but in the case of owners of traction engines, etc., who

There is now no authority which can compel a local body to maintain a perfect road surface, and in some of the Eastern counties the roads are in a disgraceful state from the motorist's point of view. Probably with a view to economy thousands of miles of roads in this country are practically useless, and avoided by those to whom the hotel keepers and village engineers are looking for custom and profit. Hence the shortsightedness of the policy which allows such apathy to exist. But it is almost impossible to bring the importance of such facts to bear upon local bodies full of prejudice and incapable of appreciating the new movements that are developing with a celerity that is really wonderful. It is not often that we find a public authority so enterprising as that of the Kesteven Division of Lincolnshire, which has engaged Mr. E. Pennell Hooley, the county surveyor of Notts, to advise them as to improving the road surface in that area. Nor do we always find county surveyors so up-to-date as Mr. Hooley, who has hired a voiturette for the purpose of making an inspection.

Hence we welcome the plea that some power of supervision should be given to the Local Government Board with regard to the roads. The idea that the Board should also have

FIG. 2.—THE "B.E.C." ELECTRICAL TONNEAU. (See page 64.)

have to secure separate licenses to travel in each county. Surely, one license might be obtained entitling such owners to travel throughout the country and not have to waste their time and money in becoming acquainted with the vexatious and varying regulations of each local authority.

The matter is not merely of interest to motorists and cyclists; but it is of vast importance to all engaged in agriculture and in the many industries that are likely to benefit from the adoption of motor vehicles for heavy traffic. In place of the present unsatisfactory arrangement or, rather, want of arrangement, the Hon. J. Scott Montagu is pressing for the creation of a new department of the Local Government Board, which "shall be a supreme road authority, acting as an intelligence department in all matters relating to the construction and maintenance of roads, and which shall have power to take action in cases where the local authorities have failed to do so." This revival of a suggestion made fairly frequently during the last decade is likely to attract considerable attention, especially when its effect on the prosperity of those living on or near the great public highways is recognised.

an Intelligence Department is worthy of consideration, especially when we remember the long stretches of newly laid stones that have been encountered on some of the runs of the Automobile Club and also the dreary patches of unrolled flints that have had to be traversed by motorists who had no prior information as to the road repairs in progress. There are many ideas that could easily be worked out by such a department for the benefit of automobilists; meanwhile, we record our assent to the general principle that a central authority should have supervision of the roads and be empowered to take action where local authorities are negligent of their duties. Motorists throughout the country should welcome the suggestion and bring it to the notice of their Parliamentary friends—for much individual persuasion will have to be universally indulged in before the proposal is accepted by the Government.

MR. H. C. FRICK, of the Carnegie Company, Pittsburg, U.S.A., has recently purchased a Serpollet steam car.

HERE AND THERE.

It is not many months since we gave an illustration of the premises of Messrs. Dennis Brothers, Limited, at Guildford. In the interval the automobile department of the firm's business has increased so rapidly that a further extension has been rendered necessary. The illustration shows the new extension to the

factory at present in course of construction. They anticipate that this will be completed within a month, and that it will give them sufficient working room for between two and three hundred workmen, so that they will be able to bring up the output of Dennis cars to six or eight each week.

WE hear that a movement is on foot to start a motor-cycling club in Belfast.

ON Saturday, the 12th prox., the Midland Automobile Club will have a circular run, concluding with a dinner at the Grand Hotel, Birmingham.

AN oil painting, once the property of George III., can be obtained—we read from an advertisement—in exchange for a 8 h.p. car, Panhard preferred.

M. SANTOS DUMONT, who has returned to London, intends to take his airship round St. Paul's dome on Coronation Day, and will continue making experiments during the summer.

A 10-H.P. DAIMLER char-a-banc has just been imported to Melbourne, Victoria. It is intended for a passenger service between Melbourne and St. Kilda or South Melbourne.

MR. H. CURTIS, of Birchills Street, Walsall, has sent us a rough sketch of a small carburettor he designed two years ago and fitted to the induction valve of the motor of a 1½-h.p. motor-tricycle.

TRAMWAYS and light railways are encouraged to an inordinate degree on our public roads, and of applications relating to 385 miles of railway lately scheduled, 319 were for lines laid on existing roads.

NEW premises have just been taken by the Motor Power Company, Limited, at 14, New Burlington Street, Regent Street, S.W., in connection with which is a garage, allowing ample room for at least 150 cars.

THE London and Suburban Motor Omnibus Company, Limited, has been registered with a capital of £5,000, to carry on the business of omnibus, tramway, motor-carriage, and van proprietors. The registered office is at 90, Sidney Street, Mile End, E.

THE Eastern section of the Scottish Automobile Club had a run on Saturday last. The motorists assembled in Charlotte Square, Edinburgh, at noon, and drove to Aberlady, lunching at the Golf Hotel, after which the journey was continued to North Berwick, and then home. Among the party were Mr. John Macdonald, who drove his Daimler car; Dr. Dawson Turner a Delahaye, Mr. J. M. Inglis a Benz, Mr. W. Hunter an Argyll, Mr. Sanderson a Benz, and Mr. James Hunter a Daimler. The Scottish Motor Company sent three cars for the use of members not having vehicles of their own.

AT the Theatre Royal, Cardiff, this week, where Mrs. Lewis Waller is producing "Zaza," a motor-car, supplied by the South Wales Motor Company, is to be seen on the stage. This is the first time a motor-car has been employed on the stage in South Wales.

THE Clipper Pneumatic Tyre Company, Limited, are now conducting the motor-tyre repairing business hitherto directed by the Continental Caoutchouc and Guttapercha Company, Limited, and motor tyres or tubes requiring repair should be sent to the former company.

WITH regard to the paragraph in our last issue stating Messrs. De Dion are placing a motor-bicycle on the market with engine of 1½-h.p., Messrs. De Dion-Bouton, Limited, write to point out that the information is rather premature. At present the motor is only in its experimental stages.

THE Princess Victoria, who has lately included a motor-car depot on her list of London calls, will be at Cromer for Easter, and may probably be a spectator of the speed trials. Attended by Lady Musgrave, who is an enthusiastic motorist, she will stay at Lord Hillingdon's house at Overstrand.

IN connection with the Easter tour of the Automobile Club to Cromer, Messrs. Mann and Egerton will have a supply of petrol, spare parts, etc., at Norwich, for the convenience of motorists who may be lacking in the essentials to automobile success. Similar services will be rendered at Hunstanton and King's Lynn by Messrs. W. H. Johnson and Sons.

AN engineering conversazione was held at Battersea Polytechnic on Saturday evening last, and in connection with the same an exhibition of machinery was organised. A cycle and motor-class is held at the institution, and much interest was shown in the parts of a small petrol motor which had been machined by the students. Among the other exhibits that we noticed were: a Kitto motor-bicycle, a section of a Daimler motor and Daimler transmission gear, specimens of the Renold silent chain, and a novel two-cylinder petrol motor, with mechanically-actuated inlet valves, designed and constructed by Mr. H. Taylor, the teacher of the class.

FRENCH automobilists are taking a keen interest in the approaching elections, and they are sounding the candidates on the subject of their attitude towards motoring. They are able

THE ALCOHOL COMPETITION—NOT THAT PROMOTED BY THE FRENCH GOVERNMENT.

Das Schnauferl, Munich.

to put their advocacy on a patriotic basis, since if automobilism is fostered, and the cars use alcohol instead of petrol, the country will benefit. Apropos of this point, the *Auto-L'elo* tells a story which will bear translating. "A candidate, who is a motorist, has already started his canvassing, and called on a wine and spirit merchant. As soon as he began to expound his views the latter remarked slyly, 'Yes, that's all right. I know by experience that there's nothing better than alcohol as the motor-power of an election.'"

THE municipal authorities of New York are about to carry out some trials of a motor dust van.

CAPTAIN THORNYCROFT VERNON rode from London to Liverpool the other day on his 7-h.p. car, accompanied by Mr. E. Shrapnell Smith, secretary of the Liverpool Self-Propelled Traffic Association. The route was by Banbury, Coventry, Lichfield, and Knutsford, the journey being completed before the weather broke.

MESSRS. H. FENTUM PHILLIPS AND COMPANY, of Guildford Electrical Works, North Street, Guildford, inform us that they now have facilities for charging main electromobile cells or ignition batteries at any time. Any voltage can be obtained, and the charging is carried out under the supervision of experienced electricians.

A LONDON journalist intends to have a trip from London to Land's End, thence to John o' Groat's and back again to London—concluding his journey at the Agricultural Hall, Islington, during the progress of the Exhibition. A 12-h.p. car of British manufacture will be employed, and the object will be to test the Martin pneumatic tyre.

A CHICAGO firm has introduced a motor-car fitted with what it terms a traction wheel, which is said to enable the vehicle to be driven through snow, mud, or sand. The wheel is arranged to receive the exhaust from a steam engine or the cooling water from a petrol motor, which, it is stated, keeps the traction wheel warm and enables it to grip the snow.

THE annual dinner of the Manchester Automobile Club was held on Thursday, the 20th inst., at the Albion Hotel, Manchester, and was attended by about forty of the members. Mr. S. Okell presided. A selection of instrumental music was given during the dinner, and Mr. Ernest Hastings gave a number of humorous sketches, terminating a most enjoyable evening.

NOT often are motorists exempt from the restrictions of local authorities, but in connection with a bye-law just adopted by the Middlesex County Council, in regard to the blowing of horns by persons in vehicles on Sundays, a clause has been inserted as follows : " Nothing in this bye-law shall prevent the use of a horn in a reasonable manner by one person on a coach or similar vehicle."

WITH regard to the rumour that Messrs. De Dion had decided to revert to the plan of locating the motor in their light cars in the rear part of the frame, Messrs. De Dion-Bouton, Limited, write that, as we surmised, the report has apparently arisen owing to the fact that the pump is on the latest frames, driven by a small bevel pinion just behind the gear box at the back of the car. At the same time they add that they are prepared to supply the $4\frac{1}{2}$ h.p. type of voiturette, fitted with either $4\frac{1}{2}$ or 6 h.p. engines, the latter being suitable for use in mountainous districts.

We learn that Stirling's Motor Carriages, Limited, of Glasgow, have just acquired the extensive works and plant at Granton, Edinburgh, of the Kingsburgh Motor Construction Company, Ltd. The site of these works covers an area of about seven acres, about half of which is already covered with substantial buildings, and the plant is of the most modern type. The works are electrically driven and are surrounded by a macadamised testing track of four laps to the mile. The Stirling Company, in addition to their light cars, will manufacture vehicles specially for public services and for express delivery service. A sample of the former has already been tested for over 10,000 miles, and the running costs have been carefully preserved. We understand that the economy in cost of upkeep of this car has surpassed the expectations of the designers. The car will, we learn, be exhibited at the Automobile Club Show next month, and gearings and bearings will be detached for the inspection of all interested. We hope shortly to be able to illustrate and describe the vehicle, which will be known as the "Stirling Public Service Car." We may add that the manufacturing depôt of the Granton works is under the charge of Mr. A. J. Drake, late manager of the Daimler Motor Company, Ltd.

IMPORTS OF MOTOR-CARS, CYCLES, AND PARTS.

BELOW we publish our monthly official list of the imports of motor-cars, motor-cycles, and the parts thereof into the United Kingdom during the month of February, 1902. Compared with the preceding month, the total imports officially recorded were as follows :—

February, 1902	£52,928.
January, 1902	£37,988.

Thus the imports for the first two months of the present year have been £90,916 as compared with £80,015 in the last two months of 1901 and show an increase of £10,901.

CORRESPONDENCE.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“M. D.” does not state the make of his car. I have never read or heard of a cast-iron fire box for these light steam cars, and do not know to what “M. D.” refers.

A long experience with stationary oil engines has convinced me that paraffin burners are a very doubtful success on account of their proneness to smoke and corrode the burner. If “M. D.’s” car is a Locomobile, I should advise him to revert to the petrol burner, which gives practically no trouble, and petrol is much cheaper now than it used to be. Depend upon it, if paraffin could be successfully used, the Locomobile people would soon fix a suitable burner to their cars.—Yours truly,

WORSTEAD.

THE OLDSMOBILE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been reading the description and looking at the illustration of the new American petrol car “Oldsmobile,” and I should think (there being no distance rods, as far as I can see, joining the two axles) that if a heavy driver sat on one side he would depress the spring on that side and put the chain wheel out of truth and wear the chain badly, also I should think the steering would be uncertain. Has this been foreseen and made provision for by the makers?—Yours truly

A. C. E. WHITTARD.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Pennell rightly contends that what we want is a powerful engine fitted to a strong bicycle, and, let me add, a bicycle of approved British make. Like himself, I have been a sore grumbler, and am, perhaps, somewhat hard to please. I had a pleasant season with the Werner (also many troubles) last year, and have since tried a great number of 1902 machines without lighting upon anything really satisfactory both as regards engine and excellence of bicycle construction. At last, however, my pains were rewarded, and I have found for myself (and an equally discontented friend) a machine at once very powerful, strongly made, and comfortable. The machine in question is the new 2½ h.p. “Excelsior.” The bicycle itself—a point nowadays too much ignored—is admirable. The motor gives, if required, a very high speed (a thirty miles per hour burst does not “extend” it at all), and enables hills of one in six, at any rate, to be ridden without pedalling. I am told that one in five has been done, but the former gradient I can vouch for. The long wheel-base of this machine renders it comfortable—a revelation, in fact, to ex-riders of the front-driver; it can be run on a mere “smell of petrol” (at need), as one of its admirers observed to me, and stands up surprisingly on grease. The belt seems to work very well. I, and a similarly-mounted friend, hope to report later the results of thorough tests; a preliminary run has left me provisionally quite satisfied. The engine is a M.M.C. De Dion.

As regards belts, the Palace trials went certainly in favour of belts, as opposed to existing chain-drives, and the climbing feats of the belt-driven “Excelsior” spoke, of course, for themselves. Of late I have been examining a new composite belt—the “Rex”—which gives a most effective “bite,” and may be run with good results even when apparently slack. This kind of belt, used in conjunction with a pulley having a grating-bottomed groove, or a sinuous groove, will probably solve the transmission question very decisively. Belts have many advantages which ought to be preserved, if possible.

It has been disputed whether so powerful a machine is desirable or not. Expert driving is, of course, requisite; one would not put it into a beginner’s hands. Probably 1½ h.p. or 1½ h.p. is more suitable to the needs of the great majority of riders. But, as Mr. Pennell has so seldom a good word to say for British-made machines and designs, I think it only fair to draw attention to the fact that a machine such as he sighs for is both in existence and a proven success in the hands of those who can use it.—Yours truly,

E. DOUGLAS FAWCETT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent “J. A.’s” letters of March 1st and 15th inquiring for a satisfactory motor-bicycle, may I call his attention to the Hewetson as recently described in your columns? I have now ridden my machine for close on 500 miles, in all conditions of weather and over all roads, without mishap, the only adjustment being the tightening of the belt. The ignition being on the magneto principle, the worries attendant upon the ordinary accumulator or battery ignition are entirely eliminated. The control of the machine is extremely simple, there being no necessity to remove the hands from the handle-bars for manipulation in traffic. As a hill climber I consider it unrivalled for its engine power. With regard to weight I am afraid that it will not meet “J. A.’s” requirements, as it scales nearer 100 lbs. than 60 lbs. The machine is most amply proportioned, safety being considered before extreme lightness. A sight-feed lubricator being fitted, the bicycle will cover about eighty miles without dismounting, at a speed very considerably in excess of twelve miles an hour, if so required.—Yours truly,

H. HANAY.

MECHANICAL FLIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the *Journal* for March 1st the article on “Mechanical Flight” refers to exceedingly light motors for use in aviation. I have been interested in the study of mechanical flight for some years past, but have in all cases been debarred from any tangible success mainly through lack of ability to procure a sufficiently light motor. The said article deals with a motor by Professor Langley, weighing 7½ lbs., and generating 1½ horse. This seems the very motor I require. I am designing a new balloon, for which I hope to use a motor of this or some other description, and should be glad if any reader would send particulars as to where I may procure such a motor. It should not, for my purpose, weigh more than 10 lbs. at most, and generate as much power as possible. Can any of your readers put me in communication with people versed sufficiently to say whether a petrol or steam-motor is best for a balloon of model size from twenty-five to thirty feet long by 1½ yards thick at middle? I have read with interest the articles, and feel so far pleased to know that I have not been working on the wrong lines in my experiments.—Yours truly,

FRED CROCKETT.

QUERIES RE PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would any of the readers of the *Journal* kindly answer the following queries, which I think you will agree are of general interest? First: What are the general causes and remedy for the occasional bang or loud report in the exhaust box often heard on even new motors properly timed and valves correctly ground? The general idea is, of course, a misfire in the cylinder or a series exploded in the hot exhaust-pot. Is there a danger of exploding and firing petrol tank when adjoining? As a most reliable means of ignition, what are the merits of the latest systems of ignition, viz., the latest Basse and Michel induction coils and trembler and a 4-volt accumulator, the Simms-Bosch oscillating or rotary armature or sleeve magneto, the Dawson magneto or any other latest form of ignition? Are there any cars fitted with both magneto and electrical ignition? is the combination workable? or is it a fact, as I have heard from those who have tried, that they short circuit each other through the engine or frame.—Yours truly,

“PETRO.”

COST OF MAINTENANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A letter which appears in your issue of the 15th inst., signed “A Motorist,” is calculated to thoroughly frighten any intending purchaser of a moderately-powered or small motor-vehicle. “A Motorist’s” expenses seem to work out at £246 9s. 8d., apart from wages and stable rent, for an 8 h.p. to 12 h.p. car, whatever that may mean. After the speed and brake trials in Welbeck Park, a short time ago, Mr. Mark Mayhew, if I remember rightly, had a small consumption trial, and succeeded in driving his 20 h.p. car over forty miles on two gallons of petrol, so I imagine that one and a-half gallons would be a fair average for the car mentioned for about thirty-five miles, if carefully driven. This for 300 days at 1s. a gallon gives £22 10s. as the cost of petrol, instead of £60, as mentioned by “A Motorist.” If his other expenses are reduced in the same proportion, I think we shall arrive at a much truer estimate of the cost of running and upkeep. As regards the conduct of “A Motorist” and his engineer in leaving a fellow-motorist stranded, I sincerely hope this is quite an unparalleled episode.—Yours faithfully,

L. L. POWELL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 15th inst. “A Motorist” gives an account of his yearly expenditure in connection with his car. May I ask if these items represent an average yearly expenditure on a car, as they strike me as being somewhat excessive. The total works out, with wages, about £400 a year. I trust some of your other readers may give their experiences in this matter.—Yours truly,

“A WOULD-BE MOTORIST.”

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in sending statement of cost of maintenance of my 3½ h.p. De Dion Progress car for twelve months’ running, during which time it has covered about 2,400 miles:—Petrol, at 1s. 3d. per gallon, £5; tyres (new treads), £5; lubricants, £1; repairs and warehousing, £3 10s.; licence, £2 2s.; new plugs (2), 6s. total; £16 18s. I think the letter of “A Motorist” in your last issue on this subject is very misleading to motorists, and fear he must have had a tremendous craze for throwing money away on his car to spend £246 9s. 8d. on its upkeep. I use my car for business purposes mostly, and it is almost in every-day use. I require no mechanic, and have only been stopped once on the road, when my pump chain came off, but, fortunately, that time was not when I was on business bent. As regards cleaning of car, one of my assistants attends to this, which does not take up more than three hours of his time in the week. Hoping the above information may prove interesting to the readers of the *Journal*, and that others may follow in giving their similar experiences and expenses for one year’s working.—Yours truly,

CHAS. HANNAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much surprised to read "Motorist's" letter, and if I found the cost of motoring anything near his estimate I should not note. The figures given are, in my opinion, absurd. As I spend quite three times as much on new tyres as on repairs, I cannot understand his item of £85 at all. I find I have spent about £50 in twelve months; my mileage in the time has been about 12,000; £5 for paraffin, grease, polish, and brushes; for lubricating £5 would be nearer the mark. Insurance and licence can be anything you like to pay; I pay on two cars £11 4s.

With regard to the mechanic, I am sorry for "Motorist"; I scarcely know who is master and who is man. Certainly I would not keep a man who flatly refused to assist another on the road. I know about ten owners of cars who pay under 25s. per week, and in each case there is little danger of any of them requiring assistance when on the road. I will now give as nearly as I can the stoppages that I have had in twelve months, leaving out tyres. A few times I have been stopped with lamps, once broken induction valve, once the end of counter-shaft broke; this of course was a full stop, but, as it occurred near home, I sent a man for my other car and towed it to the engineer's.

My advice to anyone commencing is to purchase a moderate-powered car with as few complications as possible; 8 to 10 h.p., if weight well under a ton, is ample. Such a car should cost not over £400; another £50 for extras should be all the outlay for a good car. If driven forty miles per day, 300 days in the year, the cost should work out at about the following, and a strong, handy man at from 18s. to 25s. per week should be all that is required:—Petrol, £40; tyres £60; sundries, oil, grease, etc., £20; insurance third party risk up to £500, £9; licence, £2 2s.; man, £50; replacements, £20—total, £201 2s. The owner in this case must learn something about his car, which, if he is at all of a mechanical turn, he should do in about a week. But nothing will teach him quicker than having a stop on the road. His great trouble will be tyres, but there the strong, handy man is quite as good as the mechanic. His next great trouble will be the ignition. This he must master himself. I quite think lamp ignition is done for; I should advise electrical only. If you have both it is taking on complications, and when the least thing occurs you fall back on lamps, and so never master the electrical. With such a car and a good handy man, in my opinion, there is much more enjoyment, and the owner may then develop into a real motorist instead of a touch the button man.—Yours, etc.

ERNEST ESTCOURT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the criticisms in your last issue on my letter, I must justify myself by explaining that I have a 8-h.p. car, and also a 12-h.p. car. One machine weighs 30 cwt., and is used for carrying luggage to and from the station, errands, etc., and has to traverse a rough and hilly road. Consequently it consumes more petrol than would be the case if it travelled only smooth and level ground. My 12-h.p. Panhard weighs 24 cwt., and is used for pleasure purposes only.

Both cars are kept going daily—Sundays as well as week-days—and each covers, on an average, forty miles or more a day. My mechanic and a boy of seventeen years of age have as much as they can do in keeping the cars clean and fit for work; and there is little idleness for them, especially as one car is out until eight o'clock at night, and leaves home again at 7.30 a.m., having been properly washed, oiled, and thoroughly examined.

I hope to be clearly understood by the foregoing that my cost of maintenance was meant for two cars. In my figures I included the wear and tear of tools, etc., having a small repair shop of my own with forge, drilling machine, etc., which I find most useful. I am more than twenty miles from any large town, and so have to depend on my men for repairs, etc.

Yours truly,

A MOTORIST.

MAGNETO-ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an Orient Express which has given me every satisfaction up to the present. Recently, however, I have not been able to get the engine to start. I may say that the motor is in good order; it is the magneto-electric ignition which is wrong. I am very much afraid it is the magnets which have become de-magnetised. Will any readers kindly inform me how long the magnets remain magnetised, also how to tell when they are properly and fully magnetised? I may say my Orient Express is a splendid little car, and has given me every satisfaction. A few remarks on magneto-electric ignition from any of your readers who have had experience with this system would be interesting to others as well as to myself.—Yours faithfully,

MAGNETO.

RACES ON THE CONTINENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Automan's" notes in the *Journal* and his oft repeated advice that English manufacturers ought to run a number of cars in the French races, and thus prove they are superior for racing, this is very useful and interesting, but from a manufacturer's point of view is not as good as it would appear on the surface. I think no one could better qualified to speak on the subject than myself, as I have gone to the expense of running cars in French races, and shall continue to do so; but I would like to point out some of the disadvantages that English competitors labour under, that should be well considered before everybody rushes to take advantage of "Automan's" suggestion.

In the first place, it is not reasonable to hope that for some two or three years more we shall see five or six English competitors in the big French races. If we see three or four we shall be doing very well. Against them there will be competing at least thirty or forty French cars, probably equally good for racing purposes. Most of the French manufacturers are now running from six to a dozen cars in each big race, and if only one car out of the lot goes through then all is well, whereas any one English manufacturer cannot hope to have more than one or two big racing cars in any one contest for some years to come, even if he could find people to buy them and drive them, which is not one of the easiest things, as the opportunities for learning to drive these cars are somewhat limited in England. There is another point in the purely racing question that has to be considered, and that is that each year is removing the racing car further away from the vehicle that is going to be bought for ordinary use, so that the winning of a race, although tending to show that the winning manufacturer can build a good racing carriage, does not necessarily prove that he makes a good touring or wearing vehicle, as the two types are becoming so dissimilar.

I think many of the competitions held in this country have helped the English manufacturer. Take, for instance, the 1,000 miles trial, in which the chief prizes were won by English manufacturers in strict competition with foreign rivals. The various hill-climbing tests held in this country have generally been won by English competitors against foreign cars of similar types, and I think one of the best things we can do in this country is to promote plenty of competitions open to the world, and let it be clearly seen what English and French cars of similar types can do when put to run under the conditions as they are to be used in England. I quite agree as to the advertisement that accrues, especially abroad, through participating in these big races, but at the same time one does not want the English trade carried away and fixing a fictitious value on the racing advertisement. Merit and good work does tell.—Yours truly,

S. F. EDGE.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest Mr. Austin's letter, and there is no doubt there are many good features in the Wolseley cars, but the letter is apt to lead one to believe that these advantages and good features are obtainable only with a horizontal engine. In justice to my firm, I would like to point out that we obtain these advantages, and others, too, on the Brooke car—but with a vertical engine. We obtain a more efficient transmission than is obtained with the motor placed longitudinally—and with no twisting action on the frame, and at the same time a straight front axle. I doubt very much if the Wolseley cars carry less water than the Brooke—1½ gallons in the 10-h.p. cars supplying all our wants. The question of getting at and dismantling the engine does not appear to me as one of position, but more one of design. Mr. Austin also claims less lubrication troubles. This may be so, but every horizontal high-speed motor which has passed through my hands has shown signs of faulty lubrication on the bottom ends of the connecting rods, and in four cases I can call to mind the cranks have been badly cut and practically rendered useless. Horizontal explosive engines may be satisfactory if run at low speeds with open crank cases, such as Messrs. Crossley Bros. fit.—Yours truly,

MAWDSLEY BROOKE.

THE Devon County Council has passed a resolution declining to depart from their previous decision in favour of the registration of motor-cars.

A RECORDING chronograph, with an electrical attachment, has been submitted for the consideration of a Sub-Committee of the Automobile Club by Messrs. Smith and Son.

FREQUENT reference has been made in these columns to the distinctive features of the latest models of the Weston steam cars. A new type is now being introduced in a touring car of heavier build than those previously associated with the firm. It is of 7 h.p., and is provided with a water tank having a capacity for thirty-five miles, while the dash-board is fitted with a compartment about 14 ins. deep, a foot wide, and extending along the whole front of the car. This can be utilised for reserve supplies of petrol or for luggage. The vehicle has a long wheelbase, and the seats for driver and passenger are wide and roomy. A capital feature of this touring car is the arrangement for holding the tools in a convenient and unobserved position. The rear panel of the car, when lowered like the tail-board of a dogcart, reveals an enclosed panel fitted with clips, each holding a tool. Thus a complete tool-chest is provided, and every facility given for adjusting on the road, without encumbering the car in any way whatever—an ingenious device, which adds to the serviceability of the vehicle for touring purposes. The car is fitted with the water-lifter illustrated in our issue of February 8th, and we hope shortly to publish a photograph of it on the road.

FURIOUS DRIVING CASES.

At Winchester, Benjamin Trevedd, motor-car driver to Lord Wimborne, was summoned for driving a motor-car furiously. He did not appear, but sent a long letter, which was read by the chairman. P.C. Deacon, on March 5th, when at Kingsworthy, saw defendant driving the car. There was a passenger up. Tested by a measured 400 yards, the speed was thirty-two miles an hour. Defendant pulled up quick and said he was very sorry the brakes were worn, and he offered Deacon a tip to keep quiet. Fined 40s., inclusive of costs.

At Brentwood, Thomas Groves, of Maida-vale, W., was summoned for driving a motor-car at a speed of over twelve miles an hour between Brentwood and Romford on March 2nd. Police-constable Swann said the defendant covered six miles in sixteen minutes. The defendant stated to the Bench that he was driving a surgeon to an appointment in Essex. The day was a most deplorable one, and the roads were thick with mud. He drove slowly where there was danger to the public, but he did not know he was restricted to twelve miles an hour on any particular stretch of road. He always drove most carefully, the whole of twenty-seven miles occupied 2½ hours, and the law allowed him to go thirty-three miles in that time. Defendant was fined £2, and 8s. costs. The bench pointed out that the law did

NON-DELIVERY OF A CAR.

In the London Sheriff's Court Mr. Under-Sheriff Burchell and a jury have heard the case of Goodwin v. the British Automobile Commercial Syndicate (Limited), which was an action to recover damages for the non-delivery and detention of a motor-car. Counsel for the plaintiff said his client had been employed by the defendant company to sell motor-cars, and it was arranged that he might, if he chose, purchase from them a car and sell it on his own account. Shortly after Christmas the Hon. Morris Egerton sent to the company a car that had won one of the first races from Paris to Nice, with an intimation that he wished to sell it. The price he put upon it was something like £400, but he ultimately decided to accept £250. The Duke of Manchester fancied the car, and agreed to give £250 and also another car as part payment. This latter car was offered to the plaintiff for £50, and he agreed to purchase it for this sum, and paid a deposit of £25. Almost immediately he found a customer for it at £130, but the defendant company failed to deliver the car, and plaintiff was informed that they had sold it to another person. The plaintiff, in evidence, said the car which the Duke of Manchester handed over as part payment was the one presented to him by his wife on the occasion of their marriage in America. The car was practically new, and if witness had purchased it in the open market he would have had to pay £250 or £300 for it. Mr. Turvey, who purchased the car from the plaintiff, agreed to resell it for £154. On the other hand, the defendants sold the car for £115. Counsel for the defence suggested that the car had been adopted from another pattern. The jury awarded the plaintiff £128 13s., including the £25 paid by plaintiff to the defendants, and costs.

A.D. 2002.

"The charge against you," said the magistrate, "is that of walking at a furious rate. And it is further charged that you, at night, Have the streets promenaded without a light. Four miles an hour on the public way Is dangerous speed. What have you to say?" "Your Worship," the prisoner said, "I went Out for a walk and my oil was spent; But this motor officer would tell That I did not neglect to ring my bell." "Sir," said the magistrate, in accents gruff, "To ring your bell is not enough. We are resolved, let me repeat, To protect motor-cars on the public street. Only last week was a driver hurt By an unlighted child who did a spurt. The driver was injured; his ride destroyed, And the Automobile Club was much annoyed. Five pounds I fine you; your defence is vain. You must never walk without a light again."

Automobile Magazine.

THE POSTER OF THE 1902 AUTOMOBILE CLUB EXHIBITION.

not allow defendant to keep up an average of twelve miles an hour. The law was that he could not go more than twelve miles in any one hour. Defendant said he had misunderstood the law.

Mr. M. HARRISON, referring to the case of Chas. Edward Smith, against whom there was a charge at the West Hartlepool police-court of furiously driving a motor-car on March 7th, stated that after the alleged offence his client went on to Sunderland and met with an accident, dislocating his shoulder. The Bench granted an adjournment of the case.

ABEL BUCKLEY, of Galtee Castle, Michelstown, Co. Cork, was summoned at Brighton for furiously driving a motor-car in West-street, on March 5th. Defendant did not appear, but was defended by Mr. J. K. Nye. It was stated by police-constable Frederick Bignell that defendant drove his car round the corner of West Street from King's Road, at a very fast pace. It was at five minutes past twelve midday. He estimated that the car was travelling at about fourteen or sixteen miles an hour. At about 12.15 the car returned down West Street, when it was stopped by police-constable Roberts and himself. Captain Robert Wylie, who is staying at 6, Regency-square, said the car was going so fast that "not much of it was to be seen." He could walk about four miles an hour, and he judged that the car was going five times as fast. Charles Edmunds said he saw six people get out of the way of the car. He estimated its pace at about fourteen or sixteen miles an hour. Defendant was fined £10 or two months' imprisonment,

THE Electric Ignition Company, Highgate Street, Birmingham, have effected an important improvement in their sparking plug. Hitherto, the cross wire forming one of the sparking points was composed of sterling silver, and the method of adjusting the width of the sparking space was rather crude, necessitating very delicate handling. The latest sparking plug has a screwed cross wire, flat at one end for adjusting purposes by a pair of pliers, and at the other end of the pin a piece of platinum wire is fixed, making the adjusting of the sparking points extremely accurate and reliable. Another improvement is the extension of the platinum point beyond the face as a safeguard against "sooting."

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, APRIL 5, 1902.

[No. 161.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

HIS MAJESTY'S enthusiasm for yachting and motoring is being fully enjoyed by a combination land and water holiday. Like many of his subjects he indulged in an outing in the forest on Easter Monday, visiting Lord Montagu of Beaulieu at Brockenhurst, in the New Forest. The King was received at Buckler's Hard, on the Beaulieu river, by the Hon. J. Scott Montagu, M.P., and Lady Cecil Scott Montagu. At the top of the hill motor-cars were in readiness, and thither the party drove. With Mr. Scott Montagu as driver, the King had a front seat on a 24-h.p. Daimler car, Captain Fortescue being at the rear. Lord Wimborne had placed his car at the service of Lord Montagu; and Lord Suffield, Lord Esher and M. de Soveral were its passengers as it followed the Hon. J. Scott Montagu's car to Beaulieu, and thence to Lyndhurst—a drive of seven miles through the most charming portion of the New Forest. From Lyndhurst the route lay *via* Wilverley, Brockenhurst, and Lymington, to Mr. Scott-Montagu's bungalow on the shore of the Solent, where tea was taken. The return journey to Buckler's Hard was also made by motor-car, and the King thoroughly enjoyed his trip.

In the Isle of Wight.

ON Tuesday the King visited the Isle of Wight, being met by his motor-car at the Trinity Wharf, East Cowes. The party journeyed to Osborne, where some time was spent in golfing—a game in which His Majesty is showing increased interest. Later in the day he paid a surprise visit to the Royal National Hospital at Ventnor, proceeding thither on his motor-car, and being accompanied by Sir Francis Laking, his physician. The King subsequently called on Princess Henry of Battenberg at Osborne Cottage, and on the Duke and Duchess of Argyll at Kent House, and left East Cowes at 7 o'clock, having made a series of calls which would have been impossible but for the motor-car.

Another Royal Motorist.

KING EDWARD VII. is not the only royal motorist, a fact well known, although the presence of Prince Albert of Belgium in this country has not been generally recognised. Prince Albert is not only fond of motoring, but is also fond of driving, and many are the trips he has taken on his motor-car in the Ardennes and other parts of his father's kingdom. Our illustration on page 81 depicts him on his motor-car at Brussels.

Motoring on the Continent.

MR. BALLIN HINDE is making some interesting motor-car trips on the Continent. He journeyed from Frankfort through Switzerland to Vif, a distance of 470 miles, in 26½ hours. The snow was so heavy that he was seven hours travelling the last fourteen miles of the trip. From Vif Mr. Hinde went

to Nice. The second stage of his adventurous journey is from Nice to Vienna and back, a distance of 1,700 miles. When that is successfully accomplished Mr. Hinde hopes to get to Paris, about 700 miles from Nice, in three days.

Traps for Motorists.

THE Surrey police are in plain clothes again, and with stop-watches in their hands and prejudice in their minds they are watching unwary motorists passing along the highways of the county. Inspector Marks described the process in the case at the Chertsey Petty Sessions, reported on another page. Standing at the end of a measured one-eighth mile at Weybridge, he saw the motor-cars approach. He signalled to a constable at the other end of the trap, and started his stop-watch. As the first car passed him he stopped his watch, and found the speed was 18 miles an hour, one-eighth of a mile being covered in 25 seconds. Then he signalled to another constable at the top of the hill, who stopped them till the inspector came up. The signalling was no waving of the hand or raising of a flag, but consisted in walking from the fence to the edge of the path. Whenever motorists see policemen walking from fences to roadways, they must beware.

The Aero Club.

THE rules of the Aero Club, of which Mr. H. B. Skinner is the secretary *pro tem.*, have just been issued. The management of the Club is in the hands of a committee of twelve, and provision is made for the nomination of candidates for the committee by ordinary members before the annual meeting. The annual subscription is to be two guineas, and the object of the Club is the popularisation of "aero-automobilism" and ballooning as a sport. Aerial excursions will be organised, and encouragement given to the training of carrier-pigeons as a useful auxiliary to the aeronaut.

Punch's Cartoon.

LAST week's *Punch* contained a cartoon by Mr. Linley Sambourne, in which the Marquis of Salisbury and Mr. George Wyndham were depicted on a motor-phæton, leaving two small children by the roadside. Mr. Arthur Balfour was appropriately on the seat of the driver, attired as we recently saw him when inspecting a Napier car. The children were labelled "Irish Land Bill" and "Education Bill," and Mr. Balfour was saying, "Au Revoir! You two stay where you are. We'll pick you up again when we come back." Evidently the Ministerial party was off for the Easter holidays.

Rules of the Road.

MUCH is said and written with regard to the rule of the road so far as it affects drivers of motor and horse-drawn vehicles. But we hear little of such regulations for the guidance of pedestrians who wander from the pavement to the roadway, and then grumble if a passing vehicle causes them to accelerate their pace. Mr. H. Revell Reynolds calls attention to a frequent occurrence. "Suppose," he writes, "three or four persons walking abreast in the road are overtaken by the driver of any vehicle. At present those on the right are quite likely to jump

to the left, and those on the left to jump to the right, which, of course, is likely to lead to annoyance and to collisions. Even if it be impossible or undesirable to have any binding law passed, it should not be too difficult to establish by degrees a custom, in obeying which a motorist would be able to plead that he had done his duty, and that if a collision occurred he had not been guilty of any negligence. The simplest plan, and the safest, would be to declare that when walking in the road all persons are expected to keep to the established rule of the road; to keep to the left on meeting, and to overtake on the right." Certainly the subject is worthy of discussion and consideration.

An Irish Motor-Car.

THE motor-car is gradually increasing in favour in Ireland, and a noticeable feature is the great attention which is now being devoted to the movement by cycle traders in that country, with the result that the facilities for automobile touring in the Green Isle are now much greater than ever. Our illustration shows a motor-car which has been built at the works of Mr. Wm. Corrigan, a cycle maker at Edenderry. All the castings for the engine, transmission gear, hubs, etc., were obtained in the rough, and, according to the *Irish Wheelman*, when Mr. Corrigan began his task the only guide he had was a rough design of a belt-driven vehicle. The car was made altogether by himself, with the exception of the chain, the forgings for the back axle,

the tyres, and the ignition apparatus. It is fitted with a horizontal engine of 4½ h.p., and the transmission is by belts to the counter-shaft, and thence by chains to the road wheels.

British v. Foreign Cars.

A MIDLAND correspondent calls our attention to a paragraph in our issue of the 22nd ult., in which appeared a comparison and criticism of British and foreign automobiles. On the strength of that paragraph, our correspondent writes to suggest that we "favour the Continental trade in preference to the English"—a suggestion that is quite unwarranted, as is evident from a careful perusal of our columns. In the paragraph complained of we said that the fact that the majority of cars in this country were of foreign origin was "lamentable," and "deserving the careful consideration of all who have the welfare of British (not exclusively English) automobilism at heart." "There is no doubt," we continued, "that the best English cars are at least equal in workmanship and durability to the foreign production," and then went on to point out that the facilities of determining which is the best are greater on the Continent than here, and we came to the conclusion

that "the multiplication of trials is the only way of hastening the survival of the fittest"—a conclusion with which all the leading British makers are in agreement. In last week's *Journal* Mr. S. F. Edge wrote: "I think one of the best things we can do in this country is to promote plenty of competitions open to the world, and let it be clearly seen what English and French cars of similar types can do when put to run under the conditions under which they are to be used in England." Why such suggestions as this should be regarded as unpatriotic we fail to see.

At the Seaside.

ON Easter Monday the motor-car services around the coast were well patronised. That between Hastings, St. Leonards and Bexhill, and the district round about was augmented for the holidays, and every car available for public service at Bournemouth was crowded throughout the day. The public interest is evidently as great as ever, and those contemplating starting such services may do so with every assurance of public favour.

In India.

THE fact that efforts are now being made to influence the Government of India with a view to lessening the restrictions now imposed on the use of petroleum spirit lends increased interest to the announcement published in the *Englishman*, of Calcutta, as to the many roads in the Dependency now awaiting self-propelled vehicles in order to develop the resources of the country. The formation of a company to run a service of motor-cars between Giridih and Hozaribagh has attracted much attention in India, and the progress of that experiment will be watched with considerable interest in India—and at home.

The Late Mr. Rhodes.

THE death of Mr. Cecil Rhodes removes a great figure from the Empire, and one who would probably have done much for automobilism. A week before he died two cars left this country for his use in South Africa, and we know, from the gentleman who accompanied them, that Mr. Rhodes had hopes of travelling from the Cape to Cairo on an automobile—a journey that would have placed the position of the motor-car beyond dispute in Africa. In the last days of his life an artificial supply of pure oxygen was introduced into his lungs. On a recent Sunday he took a turn for the worse, and the doctors again had recourse to oxygen. Unfortunately the supply to hand was not sufficient, but his Wolseley car was despatched to Cape Town—sixteen miles away—in the small hours of the morning, making the trip there and back with a fresh supply of oxygen in record time. Time after time the automobile has proved its value in cases of such emergency.

Motor-'Buses.

THE steam motor-'bus plying between Hammersmith and Oxford Circus seems to be acting well and running with a regularity that is causing the drivers of horse-drawn omnibuses to despair of long continuing in their elevated positions. The other day a smaller motor-'bus to hold fourteen persons was seen on the road to Hampton Court. Among the passengers were Messrs. W. J. Bull and T. Dewar, M.P.'s, Mr. J. L. Thornycroft, Mr. J. E. Thornycroft, and Mr. T. Thornycroft—ample proof of the fact that it was a Thornycroft steam 'bus. The 'bus in question was on a trial trip, and is intended for the Belfast and Northern Counties Railway, which has already a similar 'bus. The vehicle is a capital railway 'bus, with accommodation for half-a-ton of baggage on the roof. When fully loaded and carrying its full complement of passengers the 'bus will maintain an average speed of about nine miles an hour. The omnibus

carries a small steam engine, boiler, tanks, and coal bunkers on the forward platform, and it can ascend heavy hills with ease.

Motor Cycling.

THE fine weather on Monday brought out the motor-bicyclists, and they were to be seen on all the suburban roads, the envy of the ordinary cyclist and the terror of nervous old ladies at cross roads. At many of the local cycling and athletic meetings motor-cycle contests were on the programmes, and at the Putney Velodrome a five miles motor-cycle race formed one of the attractions at the meeting of the Putney Athletic Club. The result was:—A. Westlake, Motor Cycling Club, 1; H. Martin, Queen's C.C., 2; J. Cousins-Nixon, 3. The winner was a lap ahead of the second man, his time being 9 min. 38 sec. Three laps divided the second and third.

In the Air.

DURING Easter the newspapers have had many things to chronicle with regard to aerial navigation and ballooning. The Archduke Leopold Salvator, cousin of the Emperor of Austria, has announced his intention of crossing the Alps by balloon; and Madame Otero, the famous Parisian dancer, intends to gracefully float into Biarritz in August in an airship now being constructed for her by a Belgian engineer. The airship will be dragged along by a motor-car, to which it will be attached by a thin wire hawser—altogether a very novel proceeding. M. Santos Dumont has also been much paragraphed during the last few days; the fact that he has dined at the Carlton Hotel, and that his airship is now on view at the Crystal Palace, being equally regarded as worthy of publicity. The rumour, too, is gaining credence that an aerodrome is to be constructed at Chamonix in connection with some Alpine ascents a Swiss aeronaut intends to make. Next week M. Dumont is to sail for the United States, from whence we may expect some "tall stories" regarding his projected flights. Herr Ganswindt, a Berlin engineer, has designed an airship in which a screw propeller is actuated by a small motor; and Mr. Henry Pell is credited with an airship whose motive power is hot air. Next, please!

Tyres.

TYRES are the source of more trouble in connection with motor-car matters than anything else, and a great many of the visitors to the forthcoming Automobile Club's Show at the Agricultural Hall will doubtless be attracted by the fine show of tyres which will be in the gallery of the building. Practically every known variety of tyre suitable for automobiles will be shown, while the practical assistants at many of the stands will be able to give useful hints to anxious inquirers. It must not be imagined that all tyre troubles are caused by the inherent vices of the tyres themselves. Many tyres are strained by careless driving, recklessly turning sharp corners, and sudden applications of the brakes. Of course, the latter is frequently necessary—as in the case of Sir Henry Thompson's recent experience at Watford—but otherwise braking should be cautiously indulged in, and even then reduced to a minimum. By the disregard of carefulness in driving motor tyres can be as completely weakened and strained in a short journey as in the course of fair wear and tear over many miles of road.

The 100 Miles Trial.

SUPPLEMENTING our reference last week to the quarterly 100-miles trial under the auspices of the Automobile Club on the 25th ult., we now give the performances of the cars in brief. A 5-h.p. Peugeot and a 12-h.p. Gladiator made non-stop runs, the former with two and the latter with four passengers. The Peugeot car consumed $3\frac{5}{8}$ gallons of petrol and a quart of water, the Gladiator 4 gallons $4\frac{1}{2}$ pints of petrol and half

a gallon of water. A delay of ten minutes occurred to a 14-h.p. Dechamps car, owing to the clutch needing adjustment on the outward journey, and at the fifty-second milestone the driver accidentally stopped his engine in turning. Its consumption of petrol was 5 gallons 1 pint. The 4-h.p. Rochet car was troubled with leaky lubrication, necessitating four stops, occupying $10\frac{1}{2}$ minutes in all. Two and three-quarter gallons of petrol and $5\frac{1}{2}$ pints of water were required during the run. The times of the cars up Dashwood Hill and Aston Hills are given below, the former being shown in the first column and the latter in the second:—

				Mins.	secs.	Mins.	secs.
12-h.p. Gladiator	3	15	6	0
14-h.p. Dechamps	3	51	5	58
5-h.p. Peugeot	5	14	9	44
4-h.p. Rochet	5	22	11	35

A Licence Prosecution.

THE Inland Revenue authorities have been on the alert with regard to drivers of motor-cars who have not taken out licences for their vehicles, the first prosecution of the kind having taken place last week. One result should be to cause many applications at local post offices for the necessary licence forms. Mr. A. W. James was driving a motor-car in West Street, Bedminster, when he was stopped and asked for his licence. This could not be produced, and he was summoned to the Bristol police court, where a fine of 20s. and costs was imposed.

MOTURING IN NORWAY—THE ROAD ON THE STUDSHORN.
[La France Automobile.]

Stopping Suddenly.

DOUBT having been thrown on the ability of a motor-car to draw up suddenly in a short space, Sir Henry Thompson gives the procedure as follows:—"The driver is seated with his left foot resting lightly on the clutch pedal, which is first pressed down firmly to throw the engines out of gear; the right foot following as closely as possible on the brake pedal, while the right hand rapidly applies the big drag. All this, which takes so long to write, is instinctively done in the order described by a practical driver almost as rapidly as the eye closes on the approach of a fly. He is fastened in his place by arm and feet; and I at his side, foreseeing the event, have my feet against the dashboard and my arm on the side of the carriage, and our displacement is impossible."

The Yorkshire Automobile Club.

THE first run of the season of the Yorkshire Automobile Club was held on Monday, Harrogate being the rendezvous. The roads generally were in good order, and the weather beautifully fine, the only drawback in this respect being a coldness in the breeze. There was not a large muster, only ten vehicles turning up at Harrogate. The motorists and their friends, including several ladies, left their respective destinations during the morning, and reached the Victoria Hotel, Harrogate, the headquarters for the day, shortly before four o'clock, after having experienced an enjoyable run. The majority of the cars were from Leeds, but Bradford and Shipley were represented.

Farmers Encourage the Automobile.

WHILE the bucolic mind in this country seems to associate automobilism with the decadence of agriculture, the French farming community realises its value as affording a means of cheap and rapid transport. More than that, the utilisation of alcohol as a motor-car spirit is recognised as a direct source of wealth; hence the forthcoming contest organised by the Minister of Agriculture for motor-vehicles using alcohol. The many agricultural syndicates in France are equally solicitous in the matter, and in addition to petitioning the Government to allow the Paris-Bordeaux race, many are offering prizes and doing all they can to foster the industry. The President of the Société d'Agriculture de la Gironde has written to the Automobile Club of France offering a gold medal for the best vehicle using alcohol.

Goggles.

MUCH has been copied in English journals from American exchanges of late anent the influence of automobilism on the eyesight, and alarmist reports have been freely circulated as to the bad effect of motoring on the eyes. Dr. Troussseau, a leading French eye specialist, declares that a person with sound eyes cannot suffer from a trip on an automobile, unless, of course, some foreign substance, such as dust or grit, is admitted to irritate the eyelids. Hence he recommends the use of goggles when on dusty roads in windy weather. But there again there is such a variety of styles of goggles that the choice is not an easy one. Dust will penetrate through the most minute aperture. It is therefore necessary that the lining of the goggles should fit the contour of the eye-sockets. After buying the goggles, the lining should be worked over, re-cut and re-pressed, if necessary, to obtain a regular and close fit. Linings of very pliable skin are frequently used, as they absorb no moisture, and are less liable to deteriorate than those of taffeta. The rims of the goggles should be as light as possible, and should adapt themselves to the form of the face, especially to the curve of the nose. Many opticians are making goggles, but few are adequately studying the subject, and there is room for many new shapes and styles in addition to those already on the market.

Signboards.

ABOUT 2,500 signboards have been contracted for to be put up on Long Island (U.S.A.) roads, and before May Day nearly a hundred of them will be in position. They are furnished by the Long Island Railroad Company and the New York and New Jersey Telephone Company jointly. On each one will appear the number of miles to the next town or village, together with the statement that railroad and telephone stations are located there. When will the old country possess equally useful signboards? Perhaps some enterprising motor-car firms might render service, so far as their own localities are concerned. At Arundel the Corporation have recently erected notice boards calling the attention of motorists and cyclists to the necessity for caution in proceeding through the town. At Hursley, in Gloucestershire, the District Council has decided to erect a danger board on the main road to Chandler's Ford.

Artists and Automobilism.

VERY absurd are some of the conceptions of artists with regard to automobiles, and there are very few really satisfactory drawings of such vehicles to be found in the illustrated papers. A Wimbledon correspondent draws our attention to a large picture of a motor-car which appears in the trade catalogue of a well-known firm of London clothiers, who advertise motor clothing as a feature of their business. The "car" has no engine whatever, no chains, no brakes, no gears, and is altogether a most preposterous affair, to which we notice the words "registered design" have been applied. It is really absurd to find a firm advertising motor clothing showing so little care in the preparation of its trade lists.

Heavy Traffic.

ALMOST every day brings news of the development of motor traction for goods traffic in the North of England. Liverpool, Manchester, Sheffield, and other centres of industry have all daily experience of the value of motor-lorries in the rapid and reliable transit of heavy goods, while for some time the cotton spinners of the Oldham district have been considering the advisability of conveying their goods to Manchester and Liverpool, and transmitting the supply of raw material in a manner which would render them independent of the railway companies. The reason of this is the alleged excessive cost of conveyance. Messrs. A. and A. Crompton, Ltd., of Oldham, have made experiments with much success, and there is every probability that they will extend the enterprise, and thus render themselves to a great extent independent of the railway companies, whose rates are none too light in these days of fierce international competition.

THERE is great commotion amongst automobilists in the south of France in consequence of the reported issue of an order by the Prefect of Cuneo forbidding, in the public interest, the Nice to Abbazia race through the province of Cuneo.

THE chassis of a Milnes' motor-wagon attracted much attention outside the General Post Office, London, on Thursday of last week.

It is practically settled that a speed track will shortly be available for automobiles at Bexhill, and that electrical timing arrangements will be provided.

THE deputy ranger of Richmond Park has refused permission for an automobile hill-climbing competition which the Automobile Club were desirous of holding in the Park.

AT the end of the 52nd milestone, the White steam-car abandoned the run at the last 100 miles trial of the Automobile Club, owing to the rubber tube between the condenser and the feed tank having become disconnected.

MESSRS. MANN AND OVERTON, LIMITED, 25, Mortimer Street, W., have secured the sole agency for the Georges Richard light cars. Various types will be shown at the forthcoming Exhibition at the Agricultural Hall.

AT a recent meeting of the Automobile Club of America Mr. F. R. Hutton, professor of Mechanical Engineering at Columbia University, delivered an address on automobile motive powers. He dwelt particularly on steam, considering it the most satisfactory power at present. Petrol, he said, was, however, the power of the future.

AT last the winners of last year's Paris-Berlin motor-car race have been informed that the cheques representing their prizes are ready. The amounts are not very large. Fournier gets £146, being 18 per cent. of the proceeds of the contest. Girardot, who was second, is awarded a sum slightly under £114; and Giraud, who was first in the light car class, £81. These amounts are not sufficient to cover the competitors' expenses, but each firm, of course, substantially remunerated its representatives in the contest. Fournier, for instance, is supposed to have made £2,000 by his win.

Easter at Cromer.

FOR the Easter tour of the Automobile Club Cromer was selected as the destination, and following out the suggestion in the official notes of the Club we adopted Route No. 3 for the journey to the eastern counties. But instead of starting on Thursday we, with our party, took advantage of our only opportunity to have a holiday before the Exhibition, and so went off a day earlier, viz., on the Wednesday. The day was fine, but windy and cold. The roads were dry and a trifle dusty. They were very loose, much worse, in fact, than we had been led to expect by the report of the journey made over the same route

country journey being made somewhat slowly, owing to the heavy state of the roads, the weather, and the difficulty of finding the way. Our party were the first to arrive at the seaside resort, and the remainder of the day was spent anxiously awaiting other arrivals, and learning of the progress of the wayfarers; but it was not till next morning about 11.30 that Colonel Crompton, on his long-cramped and high-g geared bicycle arrived. He was the first arrival. Next came Mr. Astell and friends, and from him we learnt that in journeying down from town he had passed numbers of cars, but they were *en panne*. We also ascertained by telephone that a very

CROMER—FROM THE EAST CLIFF.

during the previous week by the Club Secretary. Having had bad luck this year with our pneumatic tyres we thought to make certain of an uninterrupted journey by having a complete set of new tyres placed upon our recently-acquired 12 h.p. M.M.C. car. Everything being in working order the journey to Newmarket, seventy-two miles, where we made our first stoppage, was absolutely without incident, and certainly delightful, the time taken being three hours twelve minutes. From Newmarket we went on to Thetford, a distance of nineteen miles. For the first few miles the roads were very rough, but the journey was accomplished in less than forty minutes. At Thetford a stoppage was made for luncheon at the Bell Hotel. Thence to Norwich is a run of twenty-nine miles, over a beautiful road, and in the ancient city we took tea at the famous "Maid's Head." The tram-lines proved a great source of trouble, especially as the roads were very greasy, and we have since learned that an 8-h.p. Decauville was there smashed up. Mr. Campbell Swinton, who travelled on his motor-bicycle the next day, had a bad side-slip at Norwich, and was seen in the mud, owing to the bad state of the granite setts. Leaving Norwich *en route* for Yarmouth, where we intended staying the night, we met Mr. Estcourt, and stopped a few minutes to chat, regretfully having to decline his pressing invitation to visit him at his new and charming place at Wroxham. Then continuing our way we arrived at the Royal Hotel, a most comfortable hostelry, at 5.15 p.m., having travelled a distance of 145 miles since morning.

On Thursday the weather, unfortunately, broke up, and our start for Cromer was delayed by a pouring rain. The result was that we only reached a place called Stalham in time for lunch. It must be confessed, however, that time was spent in viewing Ormesby and other Broad's; a long stop was also made at Potter Heigham. Eventually Cromer was duly reached about 4.30 p.m., the cross-

large party had stayed at Newmarket the previous night. After Mr. Astell came Mr. S. F. Edge and his party, then the Du Cros's, Mr. Kenealy, Captain Locock, and others. Captain Locock informed us that he had ridden down to Newmarket, non-stop, in three hours three minutes. Mr. Edge, however, had done even better than this, having covered the distance in 2 hours 20 minutes. After these the arrivals came fast: Mr. R. E. Phillips, on a 7-h.p. Panhard, and Mr. Isidore Jacobs arrived practically together, while Mr. Burford on a 16-h.p. Milnes, Mr. de Winton, Mr. Stocks, Mr. Freeston, Mr. Bidlake—the latter having been delayed by a puncture—and others came in rapid succession. Mr. C. Johnson being on Mr. Hargreave's car.

On Saturday members and friends proceeded to Gunton Park, and, although at times the weather looked doubtful, the rain fortunately held off, and an enjoyable time in the open air was spent. We had on board Earl Russell and Mr. Napier as extra passengers, and there was a fine show of automobiles at the entrance gates to Lord Suffield's fine park. The first car to line up was Mr. Gorham's—a 4½-h.p. De Dion; then came Mr. R. L. Elliott with his four-cylindered 14-h.p. Dechamps, followed by, in the order given, the following:—10-h.p. Wolseley, fitted with a racing body, belonging to Captain Locock; Mr. Freeston on his New Orleans car; Mr. Brooke, sen., and Mr. M. Brooke, of Lowestoft, on their new 9-h.p. car; a 7-h.p. Panhard; Captain Locock's second Wolseley 10-h.p. car; Mr. De Wilton's 6-h.p. Panhard; Madame Barreto's 12-h.p. M.M.C. car; a four-cylindered Panhard belonging to Mr. G. Ducros; and another belonging to Mr. H. Ducros, jun.; Mr. S. F. Edge's 16-h.p. Napier; a Locomobile, with Mr. R. Cross, of Worstead, Norfolk; Mr. Estcourt on his Daimler; Mr. Rogers on his Daimler; Mr. Griffiths on a Humber car; a New Orleans; Mr. Grahame

White on his 10-h.p. Mors; Mr. Beavor on 6-h.p. Daimler; Mr. and Mrs. C. Cordingley and party on 12-h.p. M.M.C.; Mr. F. T. Bidlake on 12-h.p. Gladiator; Mr. Burford on 16-h.p. Milnes car; Mr. Astell on four-cylindered New Orleans; Mr. Midgley on 16-h.p. Napier; Mr. Brown, of Luton, on 16-h.p. Napier; Mr. Schlentheim on 12-h.p. M.M.C.; Mr. Kenyon on 7-h.p. Panhard; Mr. Hargreaves on 22-h.p. Daimler; Mr. Kenealy on 10-h.p. Delahaye; Dr. Hutchinson on 20-h.p. Benz; Mr. Hardy on 6-h.p. Delahaye; Mr. G. R. Smith on a Progress; two quadricycles; a De Dion voiturette; several motor-bicycles; Mr. Hutton on 10-h.p. Panhard, with unfinished racing body; Mr. Roger Wallace, K.C., 12-h.p. M.M.C.; Mr. Edge on 50-h.p. Napier; Mr. Mulliner on 6-h.p. Daimler; several steam cars; Mr. Bird on 24-h.p. Mors; Mr. Stocks on 8-h.p. De Dion; Mr. Holder on 10-h.p. Lanchester; Mr. Manville on 22-h.p. Daimler; Mr. Williamson, of Southport, on 22-h.p. Daimler; and Mr. Dangerfield on 6-h.p. M.M.C. voiturette. Mr. G. Johnson was on Mr. Hargreaves' car.

All the above cars not only had their own full complement of passengers, but many were overcrowded, so that there must have been at least 200 members and friends present

of the cars into a tour in miniature, with speed changes and care as to side-slip included. Very few of the competing vehicles went right through on their fourth speed, and one or two never got on to it at all. Naturally the times were quite unrepresentative accordingly, and, curiously enough, the further regrettable feature has to be chronicled that only the kilometre times are given in the official results, as owing to the failure of the electric timing or some other cause the figures for the complete course of a mile are not available. The course in both directions was partly up hill, and contained bends that necessitated cars travelling at high speeds to slow down to get round.

Gunton Park lies some five or six miles away from Cromer, and the numerous cars of competitors and non-competitors left the Royal Links Hotel and other quarters between ten and eleven o'clock. On entering the demesne at a lodge gate they found themselves on a narrow road leading through a wood to a large gateway, through which no car was allowed to pass until 11.30; consequently the cars extended backwards in single file for some considerable distance. There was much stripping of *tonneaus* and other impedimenta during the period of waiting, several horse-drawn vehicles being driven by meanwhile, containing keenly-

THE LINKS HOTEL, CROMER—THE EASTER HEADQUARTERS OF THE A.C.G.B.I.

Amongst the visitors were Princess Victoria and a party of friends, who for several hours watched with evident interest the movements of the cars. Her Royal Highness took particular notice of the trials, and is apparently likely to become as keen a motorist as the King himself. The other distinguished people present included Lord Battersea, Victoria, Countess of Yarborough, Earl and Countess of Yarborough, Earl of Orford, Sir Richard and Lady Musgrave, and the Hon. Mrs. Glyn.

THE SPEED TRIALS AT GUNTON PARK.

Various circumstances combined to make the speed trials in Lord Suffield's park less satisfactory than had been confidently hoped. The course itself, in the first place, proved to be a less desirable one than had been reported, and even under the best of conditions it is decidedly inferior to that of Welbeck. The latter is bordered with hedge-rows on both sides, and therefore to a large extent is sheltered from the wind; it is also nearly straight, and its gradients are all but imperceptible. At Gunton, on the other hand, the drive has no protective fringe; it undulates considerably, and is more or less serpentine in its bends.

Added to these normal factors there were the adventitious ones on Saturday of a high wind and an exceedingly clinging surface, owing to rain, and so far from the speed trials being a fast dash on the top gear, they resolved themselves in the case of most

interested passengers who were presumably friends of the owner of the estate, Lord Suffield. Eventually the word was given, and the cars filed into the park in procession, those of competitors being driven to the far end of the course, and the others on to the grass at various points of view. The first trial was then made from the far end, with flying start, at intervals approximately of three minutes, though more margin was allowed when a slow car was followed by a fast one. At the first flag the time was taken by Mr. F. T. Bidlake; Mr. H. J. Swindley was at the second flag, a kilometre away, and Mr. R. E. Phillips timed at the finish of the mile. An electrical timing apparatus was also used, the cars crossing a wire and thus ringing a bell. Four trials were made in all, or two each way.

Several owners of non-speedy cars participated in the trials, but not so many as might have been expected, doubtless through fear of the discrepancy between the racing and the ordinary small-powered types being too marked. Fate was none too kind, however, to the slow cars. No one who knows what a 7-h.p. Panhard can do will regard the performance of Mr. Granville Kenyon's as typical; Mr. E. de Wilton's 6-h.p. Panhard is also capable of better things than the figures indicate, while Mr. C. L. Freeston's 7-h.p. New Orleans shed a locking ring on the commutator in the middle of its trial. As regards the fast cars, the 50-h.p. Napier went by at a magnificent rate, but nothing approaching what it is capable of. The car which was best able to do itself justice was the 24-h.p. Mors, while the 10-h.p. Panhard proved itself a flier for its size.

An interesting feature of the results was the exactly similar time in which Mr. Harvey du Cros' 16-h.p. Panhard completed two of its trials, in striking contradistinction to the irregularity of most of the other cars' records. The Dechamps car suffered from ignition troubles. Each car, it may be added, was required to carry one passenger beside the driver, whether a two or four-seated vehicle.

The official results for the kilometre course are as follows:—

Name.	Car.	1st Trial.	2nd Trial.	3rd Trial.	4th Trial.
J. M. Gorham ...	4½ h.p. De Dion ...	M. S. 1 54½	M. S. 1 51½	M. S. 1 58½	M. S. 2 4
M. Brooke ...	9 h.p. Brooke ...	1 40½	1 38½	1 26½	1 32½
C. L. Freeston ...	7 h.p. New Orleans ...	1 56½	—	—	—
E. de Wilton ...	6 h.p. Panhard ...	2 28½	2 50½	2 28½	2 37½
H. du Cros, jr. ...	16 h.p. Panhard ...	1 4½	1 5½	1 8½	1 8½
R. L. Elliott ...	14 h.p. Deschamps ...	1 51	1 38½	1 32½	—
M. Grahame-White ...	10 h.p. Mors ...	1 27½	—	—	—
J. E. Hutton ...	10 h.p. Panhard ...	1 11	1 9	1 16	1 16½
H. G. Burford ...	24 h.p. Milnes ...	1 6½	1 4½	1 6½	1 8
E. Midgley ...	16 h.p. Napier ...	1 30	1 22	1 18	1 28½
Captain Locock ...	10 h.p. Wolseley ...	1 32½	1 26	1 25½	1 21½
W. D. Astell ...	14 h.p. New Orleans ...	1 19½	1 29½	1 23½	1 27½
R. W. Wallace, K.C. ...	12 h.p. M.C.C. ...	1 43½	1 35	1 26½	1 31½
R. Bird ...	24 h.p. Mors ...	0 53½	0 56½	0 56½	0 57
G. M. Kenyon ...	6 h.p. Miesse (steam) ...	1 19½	1 14½	1 16	1 6½
S. F. Edge ...	7 h.p. Panhard ...	2 32½	—	—	—
L. Schlentheim ...	50 h.p. Napier ...	53½	0 45½	0 50½	0 54
J. A. Holder ...	12 h.p. M.M.C. ...	—	2 15	1 56½	—
	10 h.p. Lanchester ...	—	—	1 30½	—

the owner of a Mors driving a Daimler, and *vice versa*. For ourselves, we took advantage of the invitation of Mr. Williamson, and went for a spin on his beautiful vehicle. A few miles along the road we saw the 16-h.p. Napier belonging to Mr. Brown, of Luton, firmly wedged in the hedge, the adjacent ground showing prominent evidence of a bad side slip. Mr. Brown was thrown out at the side, and his young lady friend was sent flying a considerable distance. Being a thoughtfully-inclined maiden, she carried a rug with her, and when she reached the ground, placed it upon the place where she sat. The side slip was a very bad one, having shifted the whole of the hedge and driven the earth down the other side into the field. After assisting in pushing the car out of the hedge and rendering it possible for other vehicles to pass, we motored back to Cromer to fetch Mr. Napier, who came along with Mr. Hutton on the Mors, ourselves following with Mr. Williamson. Temporary repairs were effected, and the car was got back to Cromer.

Sunday morning a great break-up of the party took place, many returning to town, others going in other directions. As far as we were concerned, our party, Mr. and Mrs. Roger Wallace, Mr. Williamson, Mr. Campbell Swinton, on his motor-bicycle, Colonel Crompton, and others, made its way to Yarmouth, where an interval for luncheon was enjoyed. Afterwards we all proceeded to the Royal Hotel, making a halt for the day, the distance for the day being only forty-three miles.

On Monday the weather was fine and inviting and, with a party reduced in numbers we made for Aldeburgh, where a stay for luncheon was made, Bury St. Edmunds being the resting-place for the night. The latter portion of the trip was most interesting from the fact that Mr. Rochester and Mr. Cordingley both had 12-h.p. M.M.C. cars, which, being fairly evenly matched, kept close company for several miles.

A late start for town was made on Tuesday after a tedious process of being photographed. The first halting-place was

SNAPSHOTS ON THE ROAD TO GUNTON PARK.

The appended table shows the average speed of the various competitors, in miles per hour, of the four trials over the kilometre course:—

M.P.H.	M.P.H.
S. F. Edge ... 44.02	M. Grahame-White ... 25.96
R. Bird ... 41.18	Captain Locock ... 25.90
H. G. Burford ... 33.80	R. W. Wallace ... 23.84
H. du Cros, jr. ... 33.51	M. Brooke ... 23.74
J. E. Hutton ... 30.37	R. L. Elliott ... 22.09
Miesse ... 30.25	J. M. Gorham ... 19.27
E. Midgley ... 26.23	L. Schlentheim ... 17.51
W. D. Astell ... 26.09	E. de Wilton ... 14.30

After the trials were over a number of motorists went for rides along the coast. It was the order for owners and passengers to get on each other's cars, and it was no uncommon sight to see

Riston, where our still further reduced party had luncheon at a most comfortable little inn, to wit, the Crown. We here said good-bye to Mr. and Mrs. Wallace, and, after some repairs had been effected to the car, a start was made for home at half-past four. Rain was then descending heavily, but very rapid progress was made until Bell Bar was reached, when the inevitable puncture occurred, causing a further delay of nearly an hour. Home was ultimately reached without further incident, and nothing remains but the memory of a most pleasant Eastertide.

M. MICHELIN predicts that in next year's French cars the wheels will be larger and that the axles will be made straight instead of being curved downward in their middle section.

THE JOHNSTON CARBURETTOR.

THE Johnston is the name given to a new carburettor for petroleum-spirit motors which has lately been put on the market by the Creek Street Engineering Company, Deptford, S.E. The device, of which an illustration is given herewith, consists simply of a lift valve, open to the atmosphere on the top side, which is opened by the suction of the motor, and closed by a spiral spring; the valve has a broad face, to the centre of which the petrol supply is brought, so that, when the valve is closed, both petrol and air are shut off simultaneously. Beneath the valve a tube is fitted, running from end to end of the carburettor, and through which the whole or part of the exhaust gases from the engine are carried. In the annular space between this tube and the casing baffles are fitted, which cause the air and petrol to pass round the tube, which is kept hot by the exhaust gases. A wire gauze diaphragm is also fitted to further intermix the petrol and air. In action, when the engine takes an inhaust stroke, the partial vacuum in the carburettor sucks open the lift valve, and as its lift is small in proportion to its diameter, a strong inrush of air takes place between the valve and its seating. Into this current of air the petrol is sucked and sprayed over the hot tube, which effectually vapourises any

heavy particles which may fall upon it, and the whole then passes to the engine as an intimate mixture of gas and air. The petrol is fed to the valve by gravity, but as the feed depends more on the suction than on the force of gravity, the supply is claimed to be all that can be desired as regards steadiness. The apparatus is of simple construction, and, after being once set to suit the particular motor to which it is applied, requires no other regulation than that of moving the petrol cock.

THE King commenced his holiday trip by visiting several places in the Isle of Wight on his motor-car.

IN driving through Watford recently, Sir Henry Thompson's motor-car was stopped in a distance of nine or ten inches, a testimony to the reliability of automobiles which County Councillors and others should note.

THE Petter portable petroleum engine, to which the name of the Tractor has been given, has been brought out by Messrs. G. B. Petter & Sons, Ltd., Nautilus Works, Yeovil. Although it is a self-propelled vehicle, it is also available for stationary purposes. The Tractor is provided with compensating gear, and drives from the rear wheels. Two speeds and a reverse are fitted. It will probably be found useful on estates and large farms.

EFFICIENCY, POWER, AND CYLINDER TEMPERATURE.

BY CAPT. C. C. LONGRIDGE, M.I.M.E.

BOTH efficiency and power are directly related to cylinder temperature, as partial effects to cause. The nature of the inter-action will be readily understood if the terms are explained. Technically defined, efficiency is the ratio of the heat converted into work to the total heat imparted to the engine. The total heat-units accounted for by the indicator diagram, or by the brake results, show what has been turned into work; while the difference between these and the total heat-units given in the form of fuel state the losses in that conversion. The more considerable source of heat-loss arises from the cooling of the explosion gases by contact with the cylinder walls and piston. Hence the higher the temperature of these latter the lower their cooling effect. High cylinder temperature, therefore, conduces to efficiency. There is naturally a limit, but it is not here necessary to enquire why and when the limit of temperature comes into play. For practical purposes it is sufficient that, within the range of permissible temperatures, the hotter the cylinder the better the efficiency. In the case of power different conditions are required. Power is the conversion of heat into work. The conception stops here. It does not include heat-loss or heat-cost. How many thermal units are wasted, or how much fuel is expended, in producing this result, is beyond the strict range of the term. Consideration is confined solely to the production of energy. In the case of the internal combustion engine it is evident that, other conditions being alike, the more charge is included in a cylinder of given dimensions the more power will be produced by the explosion. Thus power depends on the weight of the charge. Now one charge having half the absolute temperature of another will have double its weight, and its explosion will generate proportionately greater power. Low charge temperature, therefore, increases power. But it is largely by contact with the hot cylinder walls and piston that the incoming charge is heated, so that the lower the temperature of the former the better the condition for power production. In connection with cylinder temperature Professor Hele-Shaw, at the International Engineering Congress, at Glasgow, presented a summary of power tests, confirmatory of the above. The series of experiments showed that in a motor with cylinder cooling water ranging from 77° F. to 250° F. there was with increase of temperature a gradual decrease of power, extending from 4.775 b.h.p. to 3.94 b.h.p. It cannot be said that these results brought to light any new fact hitherto unknown; nor, from the omission to note the engine-speed or the quantity of water circulated, have the figures more than a relative character. But they are an interesting illustration of the value of low-cylinder temperature for power production. Under the condition of limited water supply, therefore, the automobilist who has power rather than efficiency in view may do well to use the rapid and effective forced, rather than the slow and less efficient natural, circulation of water for cylinder cooling. The somewhat antagonistic requirements of efficiency and power, under the aspect here considered, would best be met by compressing in a cool chamber, transferring, fixing, and expanding in a hot one. On this I may have something to say on another occasion.

THE suggestion has been made that the Posting Proprietors' Association in the Dukeries should consider the adoption of motor-vehicles in preference to railing against automobiles.

IN connection with the Nice-Abbazia race, the Continental Caoutchouc and Guttapercha Company is offering a series of prizes for cars fitted with Continental tyres. For cars of 650 to 1,000 kilos, six prizes varying from 2,500 to 200 francs are offered; for cars of 400 to 650 kilos, eight prizes ranging from 2,000 to 100 francs; for vehicles of 250 to 400 kilos, three — 1,000, 750 and 500 francs; and for those below 250 kilos three other prizes of similar value.

THE DELAHAYE LIGHT CAR.

WHILE still continuing to build cars on their old system, with the engine at the rear, Messrs. Delahaye and Co., of Rue du Banquier, Paris, have lately brought out a light car with the engine located under a bonnet in the fore part of the frame, of which we are this week able to publish illustrations. In the new vehicle the motor and its accessories on the one hand, and the transmission on the other, are divided into two

shaft. The belt-shipping arrangement is so devised as to bring the belt on to the loose pulley from either the inner or outer driving pulley. A hand lever at the side of the car actuates band brakes on drums attached to the hubs of each of the rear road wheels. The frame is built low, and as the wheel base is long—5½ ft.—a high speed may be attained without danger. The road wheels are of the artillery type, all being 30 in. in diameter and shod with pneumatic tires. Any type of body, such as the tonneau, as illustrated, phaeton, charette, etc., may be fitted.

FIG. 1.—THE DELAHAYE LIGHT CAR.

distinct groups, one at the front end, and one about the centre of the car. As will be seen from Fig. 2 the frame is of tubular construction rendered extremely rigid by a series of connecting stays. As regards the engine, the horizontal type has been retained. The cylinder has a diameter of 110 mm. by 140 mm. stroke, and develops 6 h.p. The water circulation is maintained by a gear-driven pump and radiators. The ignition is, of course, electrical, and a novel feature is that, combined with the spark-retarding device, is an arrangement for opening the compression cock.

Coming now to the transmission mechanism, it may be stated here that three speeds forward and a reverse motion are provided. The engine shaft is equipped with a wide pulley, which is connected with either of three pulleys on the differential counter-shaft by a single belt. The outer of the three pulleys is keyed on its shaft, and when the belt is shipped on to it the high speed is obtained. The inner pulley runs loose on the shaft, so that when the belt is on it the engine is thrown out of connection with the transmission mechanism. For the first and second speeds, the belt is moved over on to the inner pulley; the latter is carried on a sleeve on which is mounted a spur-wheel, gearing with a pinion on a short forward countershaft. On the latter are also carried a couple of pinions, either of which may be made to mesh with corresponding spur wheels on the differential shaft, from which the power is conveyed to the rear road wheels by the usual duplicate set of chains and chain wheels. The change speed gear is enclosed in a dust-proof oil-containing case of aluminium. Steering is controlled by an inclined hand wheel, on the pillar of which are mounted the levers controlling the motor and variable gear. The driver has three pedals under his control—one in connection with a throttle on the inlet pipe, one for shipping the belt on to the loose pulley, and one for shipping the belt and applying a powerful band brake on the differential

THE Marquis of Anglesey has been elected a member of the Automobile Club of Ireland, which has decided to open a garage for the use of members. The site selected is Dawson Lane, which is one of the most central position in Dublin.

MR. PERCY W. NORTHEY, of the Electric Motive Power Company, Limited, Balham, S.W., is at present at work on an improved type of electrical motor-car which promises considerable advance in several directions.

A CHILD has been knocked down and run over by the new motor-omnibus plying in London. Great Church Lane, Hammersmith (where the accident occurred) is a well-known narrow thoroughfare, the scene of frequent accidents. So frequently do accidents occur at this place that only recently the local Council decided to spend several thousands of pounds in widening the road.

A FIVE miles motor-cycle handicap was included in the programme of the Brighton Cycling Club's race meeting at Preston Park track on Monday. Twelve riders entered, and eight ran in two heats. The first heat lay between W. J. Westfield, motor-bicycle, scratch; J. J. Leonard, motor-bicycle, 320 yards; E. B. Blaker, motor-tricycle, 2 laps; J. Best, motor-bicycle, 2 laps 600 yards; and F. W. Frith, motor-bicycle, 2 laps. Leonard won in 11 minutes 30 seconds, Best being second and Blaker third. In the second test A. Rivett, on a motor-bicycle, was the only competitor to finish, his time being 9 minutes 26 seconds. In the

FIG. 2.—PLAN OF DELAHAYE LIGHT CAR.

final. Best, Rivett, Blaker, and Leonard competed. Best's machine gave out after a couple of laps had been completed. The race resolved itself into a contest between Rivett and Blaker, but the former was able to improve the lead already held, and won by a lap and a quarter, Leonard finishing third, three-quarters of a lap behind. Time, 9 minutes 1½ seconds.

A 7-H.P. MOTOR-BICYCLE.

ALREADY motor-bicycles fitted with very high-powered motors are making their appearance for racing purposes. Our illustration depicts a machine which has lately been completed by Mr. William Driver, of Lehigh Avenue, Philadelphia, U.S.A. As will be seen, the frame of the machine is of special construction, the position of the saddle and the enormously long handle bars being striking features. The motor is of the air-cooled variety and is said to develop 7.h.p. at a speed of 1,200 revolutions per minute. It drives the rear wheel by means of a flat belt one inch wide by $\frac{1}{2}$ inch in thickness. No pedals are pro-

vided, and apparently the motor has to be started by running the machine along the road, the rider then having to vault into the saddle.

AUTOMOBILE STATIONS.

THE storage, care and repair of automobiles has developed into a regular business in France and the United States, and is opening up in this country. The majority of motor-vehicle owners who live in the closely-built-up parts of towns have not the facilities or the time to devote to the proper care of their machines, and as a consequence "automobile stations" are multiplying rapidly. One great disadvantage in America, however, is that these stations are usually located in the business parts of the city, at a distance from the residences of the owners of the vehicles, thus necessitating a long ride in the train or the tram-car before a trip can be undertaken.

It was this state of affairs which induced the Century Wheelman, the premier cycling organisation of Philadelphia, if not of the United States, to transform a portion of its immense wheel-room into an automobile station. This has resulted not only in a considerable increase in annual receipts, but in a large accession of uptown automobilists, who embraced the opportunity of securing storage and repair facilities for their machines much nearer home and at less expense than similar conveniences could be had otherwise. This mutual benefit will doubtless result in similar experiments elsewhere, the larger bicycle clubs throughout the country, many of which have been in financial straits since the decline of cycling as a sport, being peculiarly adapted to the purpose, having in the majority of cases large wheel-rooms which are now practically unused, and, besides, possessing well-furnished club houses with locker-rooms and the bath-room facilities so necessary after a long trip with its consequent grime and dust.

The example set by the Century Wheelman will doubtless be followed by many other cycling organisations, not only in America, but also in Europe. Indeed, it is in the nature of things that organisations and individuals interested in good roads should work together. Why should they not live together?

MESSRS. VAUX AND SONS, of Sunderland, are employing motor-wagons in their business.

GLASGOW TO LONDON.

CONDITIONS OF THE FORTHCOMING TRIAL.

THE Scottish Automobile Club (Western Section) is organising a non-stop trial from Glasgow to London to take place on the 16th and 17th inst. It will be conducted under the rules of the A.C.G.B.I., the object being to demonstrate that, with reasonable rest, Glasgow and London are within two days' car runs of one another. It will be a trial of reliability. No advantage, from the point of view of marks, will be obtained by a vehicle which travels at more than twelve miles an hour. Marks will be deducted for all stops other than stops for traffic. The trial is open to motor-vehicles made in the United Kingdom and abroad, and to all persons registered at the Automobile Club of Great Britain and Ireland; but the number of cars of any particular type and horse power, entered by a manufacturer or agent, is limited to two.

The trial will consist of two non-stop runs—Glasgow to York on April 16th, and York to London on April 17th. The route is as follows:—Glasgow, Hamilton, Lanark, Biggar, Peebles, 54½ miles; Galashiels, Melrose, Kelso, Coldstream, Berwick, 114 miles; Alnwick, Morpeth, Newcastle, 177½ miles; Chester-le-Street, Durham, 192 miles; Darlington, Northallerton, 226 miles; Thirsk, York, 258 miles. Tadcaster, Ferrybridge, Wentbridge, Doncaster, Bawtry, Tuxford, Newark, 343 miles; Stamford, Norman's Cross, Huntingdon, St. Neot's, Hitchin, London, 468 miles.

The entry fee is £5 5s., and entries must be lodged with Mr. Robert J. Smith, C.A., 59, St. Vincent Street, Glasgow, hon. secretary, not later than the 10th inst. There will be a maximum number of marks for the run, and one mark will be deducted for every minute during which the vehicle is at rest from the time of starting to the conclusion of the run, except for:—Compulsory stop at York; traffic; accidental detours. There will also be deducted, in addition, one mark for every minute in excess of the official maximum time for the run, the time occupied by all stops having first been added. The official maximum time will be the time which would be occupied by a vehicle in traversing the trial route at a maximum legal speed plus the extra time allowed for towns and villages. Observers will insist on eight miles per hour speed in these places. For the run on April 16th, Glasgow to York, 258 miles, the maximum time allowed is 22 hrs. 50 mins.; and York to London on 17th, 210 miles, 18 hrs. 20 mins. There will be a minimum time for various stages in the journey which will be intimated to drivers and observers before starting. Arrival at the end of a stage in advance of the time allowed will involve immediate disqualification of the vehicle.

Certificates will state the total number of marks, the number allowed, and, separately, the deductions for (1) stops, and for (2) tyre troubles; also the motive power, b.h.p., as stated by the manufacturer, number of passengers carried, and nature of tyres. Vehicles will start from Glasgow Cross, on April 16th, before 7 a.m., and from a point in York, on April 17th, before 9 a.m. On arrival at York time will be taken and the cars will be stored until the following morning. Time in London will be taken at the Automobile Club.

Before the beginning of the second day's run, a vehicle will be allowed half-an-hour for replenishing fuel, lubricating, and adjustment. The number of persons engaged on replenishing, lubrication, and adjustment is limited to two persons per vehicle. One mark will be deducted for every minute occupied in replenishing fuel, oiling, lubricating, or adjustment in excess of the allowance of thirty minutes. If a part be replaced the driver must inform the Club secretary in writing, under pain of disqualification.

The Committee reserve power, in the event of their considering the number of entries insufficient, by giving notice and return of fees to entrants, not later than noon on April 11th, to cancel the trial.

EFFORTS are being made to induce the Indian Government to modify the present regulations concerning petroleum spirit.

CONTINENTAL NOTES.

By "AUTOMAN."

UNDER the patronage of the A.C.F. the Association General Automobile has been formed with the object of helping the A.C.F. to encourage the progress of the automobile industry. The temporary offices are situated at 46, Avenue de la Grande Armée, Paris. There are to be five classes of members, namely—1, high patrons; 2, honorary members; 3, life members; 4, founder members; 5, ordinary members. The subscription for ordinary members will be 20 francs per annum, but members of the Touring Club of France, Chambre Syndicale de l'Automobile, Chambre Syndicale du Cycle, etc., will only pay 15 francs per annum, whilst members of the A.C.F. and the affiliated clubs pay only 10 francs per annum. Life members pay 250 francs, and honorary members and high patrons nothing. Ordinary members must be proposed and seconded and balloted for, but members of the A.C.F. and affiliated clubs are

which is worrying all of those who are interested in the self-propelled vehicle. The new inventor is M. Lacroix, and he has made an inner tube which is itself covered with compressed rubber and supporting canvas in such a manner that it is almost impervious to nails and sharp articles; and not only that, but he claims that even should a sharp object pierce the inner tube no air will escape, as the compressed rubber will close round the object, which can even be withdrawn with impunity. Another advantage claimed by M. Lacroix is that the inner tube may be blown up to any pressure without possibility of exploding. Trials at the offices of the *Velo* seem to have demonstrated the practicability of the invention.

I AM sorry to say that I cannot quite agree with the opinion which Mr. S. F. Edge expresses in his letter in the last issue of the *Journal* on the subject of "Races on the Continent." It is principally with the foundation on which he bases his argument that I disagree with him, for I cannot see any indication of the

PRINCE AND PRINCESS ALBERT OF BELGIUM OFF FOR A MOTOR-CAR TRIP NEAR BRUSSELS.

[La Belgique Automobile.

admitted without such formalities—just on payment of the subscription. Ladies are eligible for membership if proposed by members of their families.

AUTOMOBILISTS received a shock the other day on seeing a paragraph in the *New York Herald* which gave out that the Paris-Vienna race was to be abandoned on account of the refusal of the Bavarian authorities to allow the cars to pass over their territory. I am glad to say, however, that the report is a canard. The French Chamber is on the verge of a general election, and has, as I write, only a few more days to sit. Therefore many important decisions are left in suspense. There is, however, every probability that a little later on official sanction will be given for the Paris-Vienna race, so far as concerns French soil.

A LEADING article in the *Velo* calls the attention of chauffeurs to the long-looked-for non-puncturable pneumatic tyre. There is no doubt that if such an article could be or has been discovered it would give the trade an enormous impetus and solve a difficulty

racing car being further removed from the ordinary car. In fact, the contrary is the case. Up to 1900 the racing car of the year was the touring model for the following year, as, for instance, Panhard and Levassor's Paris-Amsterdam and Paris-Bordeaux models. In 1901 it is true that Panhard, Mors, and Napier made high-powered, over-weighted cars which are now obsolete; but, on the other hand, the light Panhard and the Renault became standard carriages, and the limit of weight adopted by the A.C.F. put an end to the divergence which might have arisen between the racing car and the touring car, and turned the attention of manufacturers towards the light car, which is not only the racing car of this year, but which is taking the place of the ordinary touring car, thus showing that with the exception of some cars last year the racing models and the ordinary models are following precisely the same lines.

THERE were thirty-one starters in the caravan from Paris to Nice on Monday afternoon last. The tour is being organised by the *Auto-Velo* in connection with the Nice fortnight. The

tourists collected in the Place de la Concorde in front of the A.C.F. The weather was very unfavourable, rain pouring and muddy roads, when, at a few minutes past noon, the first car led off, driven by M. Georges Prade, but later in the afternoon the rain ceased, and the journey to Sens was accomplished successfully. There were no Englishmen in the party. Sir David Salomons, who had entered, sent a messenger to say that he did not intend to start.

MESSRS. W. K. VANDERBILT, JUN., and D. W. Bishop have been touring in the Department of the Var, and one day last week they were detained at Luc for driving their automobiles at excessive speed. It was only after being kept for some hours at the police station that they were allowed to continue their way.

THE STATUARY PRESENTED TO THE MARQUIS DE DION.
(See page 62 of last issue.)

SOME two or three years back a concern, known as "La Poste Electrique Internationale," registered in Belgium with a capital of £320,000, was introduced to the notice of the French public with a great flourish of trumpets. Sumptuous offices were taken in Paris, where the promoter of the undertaking, M. Brémont de Verragaude, installed himself in princely style and began to gather in the money which a naive and simple-minded public remitted by every post in exchange for debentures. The company has long since gone to pieces, but last week, in the Eleventh Correctional Court, the Comte de Morny, Brémont de Verragaude, and other directors and persons connected with the concern were arraigned on charges arising out of the promotion and management of the affair. The object for which the company was formed, as stated in the prospectus, was to establish on all the main roads of Europe relay stations, or "post houses," for electric motor-cars. These post houses were to be at regular distances of twenty or thirty miles, and were to be fitted with all modern conveniences for

recharging batteries, etc. An experienced mechanic was to be in constant attendance, and also a doctor at each post house to bind up any wounds caused by accidents. Even bedrooms were to be provided in case the passing *chauffeur* desired to take a rest. In grandiloquent terms the prospectus stated that, thanks to the new company, the great highways of Europe were to form a vast "electrodrome," over which hundreds of thousands of electric motor-cars were to skim like birds—stopping, of course, on the way, for recharging, refreshment and repairs at the company's electric post houses. The profits were to be enormous. A few months after the debentures had been subscribed, the Comte de Morny resigned his position as director, and lodged a formal complaint against M. de Verragaude. The company went into liquidation, and as the result of numerous complaints a Judge of Instruction was appointed to inquire into the business. Verragaude, the promoter, was arrested, but afterwards admitted to bail. He complained that he, as manager, had merely carried out the instructions of the president, the Comte de Morny, and consequently a warrant was issued for the Comte's arrest. The latter, however, was away travelling in Colombia, and Verragaude insinuated that the Comte had gone abroad to avoid the consequences of his acts. As soon as Comte de Morny heard of this warrant he returned to France and surrendered himself. Last week he was arraigned in company with two other defendants, Chretien and Verragaude. The latter, however, did not appear. Evidence was brought to show that two persons had been induced to pay money, and had lodged City of Paris bonds as a deposit to obtain concessions from the company to work some of its electric relays. These bonds were deposited at the Bank of France, and the company raised a 15,000 francs loan thereon. The case for the prosecution was that Verragaude misappropriated this money with the complicity of the Comte de Morny and Chretien. Morny's defence was that, although he signed the order depositing the stock at the bank, he was not aware that Verragaude intended obtaining an advance, and that he resigned as soon as he heard of it. This defence was corroborated by Chretien, with the result that the Comte was acquitted. Chretien, against whom two previous convictions were proved, was sentenced to six months, and Brémont, alias Verragaude, was fined 4,000 francs and sentenced to two years' imprisonment.

A NUMBER of "heavy-weight" motor vehicles entered in a special long distance contest arranged for conveyances of their class started on their journey from Paris to Nice on Wednesday last week. Fourteen immense cars arrived shortly before six o'clock in the barrack yard at Vincennes, where, under the supervision of the stewards of the contest, they took a stated number of passengers on board or loaded a required weight of luggage. The competing vehicles are divided into five classes, according to the weight carried or drawn. Among the vehicles now on the road are five omnibuses sent by the De Dietrich firm, two by Peugeot, one by the German Daimler Company, and a steam tractor by Turgan and Foy drawing several artillery carts. The long distance from Paris to Nice is to be covered in twelve daily stages. The military authorities are taking much interest in the competition, which is expected to be of great practical value, and three officers are following the heavy vehicles on a motor-car.

THE Thornycroft Motor Wagon Company of America has been incorporated at Trenton, N.J., with a capital of £180,000, to manufacture steam motor-wagons under the Thornycroft patents.

THE Buffoline Noiseless Gear Company, of Chapel Street, Levenshulme, near Manchester, have issued a circular on gears for motor-vehicles, and advocating the Buffoline noiseless gear wheels, which can mesh into any metal wheel, and do not require much lubrication. It remains to be seen, observe the makers, whether builders of automobiles will adopt departures from present custom, and will design vehicles which will enable silent wheels to gain their full advantage.

THE MOTOR-HORSE.

THE most noble conquest ever made by man is that of the motor-horse, his ever ready and willing comrade; his companion since the days of antiquity.

The trusty steed shares with him the fatigues and fortunes of war and the glory of battle. He rejoiceth in days of victory and becomes depressed with defeat.

As dauntless as his master, the motor-horse fears not the clash of arms; he loves it and seeks it with the same ardour

He is cool as a cucumber under fire, and unshaken by the most trying and unexpected incident of conflict.

He shares the pleasures of the chase, and adds to that of his master, who is never troubled by a thought for his mount, confident in the security which the new force has given him.

On the race-course he shines and sparkles; it is his element *par excellence*, and the whole world stands and wonders at his speed.

As docile as courageous, he is not carried away by his fire and knows how to display self-control. Evil temper never prompts him to vicious or destructive conduct.

He is always disposed to return to his stables, where he is content with the same limited quantity of food, administered

with due regard to economy rather than appetite. When not at work he conscientiously fasts, and, provided that he is kept clean, he is always ready for work, for he knows not fatigue.—*La Nature*.

THE Princess of Savoy and the Duchess of Aosta arrived by motor-car at Nice the other day.

ONE of the features of the 100 miles non-stop endurance trial to be held by the Automobile Club of America in May next is a tyre contest. The provision which makes all stops due to defects in mechanism, construction or operation count against the obtaining of a certificate from the Club, except those due to tyre troubles, must necessarily bring the latter into prominence. Particular notice will be taken of stops due to tyres, so as not to forfeit the desired certificate, and the record of these stops will constitute a tyre contest.

THE BERGMANN ROTARY MAGNETO-ELECTRIC IGNITION DEVICE.

THE question of the ignition of the explosive charge in petrol motors continues to attract considerable attention. The adoption of the Bergmann rotary magneto device by the German Daimler Company gives colour to the claim that

FIG. 1.—FRONT VIEW OF MODEL OF BERGMANN MAGNETO IGNITION DEVICE.

the arrangement possesses some points of improvement, so that a description, with illustrations, may not be without interest. The

FIG. 2.—DIAGRAM OF CONNECTIONS.

Bergmann rotary magneto-electric machine produces alternating currents of low tension. The only movable part of the machine,

the armature, has a rotary motion. The magnetic field can be shifted so that no matter what be the relative position of the magneto armature and the engine piston, the spark always passes at the moment of maximum tension. The complete outfit is composed of three parts: (1) the magneto generator, (2) the interrupting mechanism, (3) the ignition plug. The magneto is always placed near the engine, which permits the armature to be given a rotary motion. The magneto may be

FIG. 3.—DIAGRAM OF CONNECTIONS—ELEVATION AND PLAN.

driven (1) by connecting it directly with the engine shaft this connection should be slightly flexible to allow the armature a little play; (2) by gears, and preferably by raw-hide gears, which are noiseless; (3) by chains and sprockets. The latter are especially applicable where the available space is

FIG. 4.—SIDE VIEW OF MODEL OF BERGMANN MAGNETO.

limited. This transmission is possible with the Bergmann generator, as the slight variations of the position of the armature coil due to stretching of the chain have no appreciable

influence on the generation of current, and are easily corrected by adjusting the direction of the magnetic field.

The magneto may run at the same speed as the engine. Where possible, with high speed motors, running at 1,200 revolutions per minute, for instance, it is, however, sufficient and even advantageous to reduce the speed to one-half. Sparks of an intensity sufficient to effect ignition are obtained at very low speeds. Around the shuttle armature A (Fig. 2) is placed a concentric sleeve B, which may be turned around its axis, and thus move the direction of the magnetic field.

The interrupting mechanism may be constructed on several

FIG. 5.

different lines, one of which is indicated by Fig. 3. The time of ignition is varied by varying the time of interruption. This may be done by displacing the igniter lever H or the ignition cam N. The lever H must not touch lever d before the moment of interruption. The spark is the stronger the greater the force with which the lever H strikes the lever d. At the moment of rupture in the circuit the magneto produces the strongest current. The adjustment to insure this result is indicated in Fig. 3. By displacing the lever H with relation to the cam N the spark occurs at some other position of the armature with relation to the sleeve

FIG. 6. —BERGMANN MAGNETO, AS FITTED TO BENZ-TYPE MOTOR—
ELEVATION AND PLAN.

B, and is consequently weak. It is therefore necessary to make the motion of the ignition lever and the sleeve dependent, so that an energetic spark is obtained whatever be the timing of the igniter. This end is attained by giving to the sleeve, by means of a link, an angular displacement proportional to the

longitudinal displacement of the lever H on its shaft h. The proportion between the two displacements is determined by experiment.

The igniter, or plug, Fig. 5, is of bronze. The rod d has a bearing in the plug, and the other rod c is insulated from it by steatite. The two rods are of wrought iron, but the hammer is of slightly hardened steel. The plug is fastened to the cylinder by means of its flange, and an asbestos washer is used to insure a tight joint. The interrupting mechanism is charged according to the position of the valve boxes and of the exhaust cam. The ignition cam turns, of course, at one-half the speed of the crank shaft, and may have the raised portion either on its circumference or on the face. The ignition lever H terminates in an elastic piece, which avoids any injury being done to the mechanism by a reversal of the motor. The time of ignition is, however, so easily controlled that a reversal during starting is very improbable.

Among the advantages claimed for the device are: —(1) The possibility of moving the magnetic field in advancing or retarding

FIG. 7. —BERGMANN MAGNETO, AS FITTED TO DE DION MOTOR.

the ignition spark, and through this changing the speed of the motor; (2) the low tension, which can be easily insulated; and (3) the absence of accumulators, dry batteries, or induction coils. We may add that the Bergmann device is handled in this country by the Orient Express Car Syndicate, 1, Princes Road, Holland Park Avenue, London, W.

At the automobile exhibition just held in Chicago there was exhibited a steam tricycle, fitted with a two-cylinder engine, and placarded with the legend, "Built in 1888 by E. F. Brown, Chicago."

THE Automobile Club of America has decided to award annually a gold medal to the police officer who exhibits the greatest bravery and risk to himself in stopping a runaway horse in New York.

THE president of the Automobile Club of California has issued a circular letter to horse owners stating that it is the desire of members of the Club to be as considerate as possible to them, calling their attention to the fact that horses can easily be accustomed to automobiles, and offering in behalf of the Club to place at any given point two or three motor-cars for the training of timid horses.

AN American genius is reported to have secured a patent for a curious device for creating energy by feeding a tape of explosive caps into a chamber where they are successively exploded by a mechanically-driven hammer. The resulting gas from each explosion passes into a pressure storage chamber, whence it is drawn into a motor, in a manner similar to that in which steam is taken from a boiler into a steam-engine.

A NOVEL STEAM CAR.

A NOVEL form of steam-car, which has been named the "Transit," has lately been completed at the works of the Steamobile Company, at Keene, N.H., U.S.A., from the designs of Mr. W. S. Rogers, the manager of the company. As will be seen from Fig. 1, the novelty lies in the form of the carriage body, the *tonneau* being placed in the front part of the frame, instead of in the rear, as usual. The normal carry-

FIG. 1.—THE STEAMOBILE TONNEAU.

ing capacity of the car is four people, but it is stated that "five can ride pleasantly, six comfortably, and seven on a pinch." The claim for the design is that the front passengers have a free and unobstructed view of the road and scenery in front of them and are not annoyed by the dust and dirt to be found on all automobiles where the seats are behind the driver. The driver's seat is no higher than that in the present types of steam carriages, but he is able to see over the heads of the passengers. The *tonneau*, which is large and roomy, with well upholstered seats, can be removed in ten minutes' time and a parcel chest substituted, making it a delivery wagon of convenient form (Fig. 2). The weight of the vehicle complete is about 12 cwt.,

FIG. 2.—THE STEAMOBILE DELIVERY VAN.

water capacity 36 gallons, and the petrol capacity 12 gallons. The car is fitted with the Steamobile Company's special 6-h.p. engine and their straight shell boiler with 428 tubes.

THE Alliance Electrical Company, Limited, of 137, Regent Street, S.W., is, we learn, about to place a new electrical motor-car on the market.

THE stud of electrical motor-cars owned by the proprietors of the Carlton Hotel, London, will be increased in time for the Ascot Races.

HOW TO SELECT A MOTOR-CAR.

ALMOST daily we are asked by some correspondent to specify which is the best motor-car on the market. To such a question it is difficult to give a categorical answer, since personal tastes and prejudices enter so largely into the matter. As the French say, *chacun à son goût*, which means nearly the same thing as the old Latin *de gustibus non disputandum*. Still, so numerous are the various types of motor-carriages now in common use, that one who has but a superficial knowledge of mechanics scarcely knows which form to select for his own purposes. Yet there are several plain considerations which are bound to govern the most inexperienced layman in the choice of a motor-car.

The use to which the vehicle will be put is a question of paramount importance. It should be determined in advance whether the car is to be employed for long-distance travelling or for town driving. In the first case a petrol carriage will probably prove the most serviceable, while in town electrical and steam vehicles may be considered.

The question of price comes next. The automobile industry at present is in very much the same state as was the bicycle industry in 1889. At that time a good machine was worth about £30. Now a bicycle, better constructed and more durable, can be bought for a third of the money. As in those days, it is better to purchase a car from one of the large manufacturers. The prospective automobile buyer should not hesitate to pay £20 or £30 more for a car that will perform all the services which he may expect it to do. When the amateur visits the various depots and compares different models, he should not allow himself to be wholly influenced by the exterior of the carriage or by the more or less happy arrangement of parts; for external appearance has little to do with mechanical construction, and can be made to suit the taste of the purchaser. What is of greater moment is the motor and co-acting mechanism. The motor constitutes the essential part of the car; everything else is largely of secondary importance. The purchaser should carefully examine the car which he has in mind and ascertain whether its motor and power-transmitting mechanism are good and adapted to the needs of the vehicle; whether the framework is strong and capable of yielding to strains and shocks, and whether the controlling and steering mechanisms are easily operated. The prime consideration, it must be repeated, is a good motor, simple in construction and operation, all the parts of which are readily accessible and easily controlled.

Light cars, of which there are several types in general use, have the advantage of being cheaper than the larger automobiles. They are eminently serviceable, not only in towns but also for long-distance travelling and touring. An important point on which the purchaser of a motor-car for country use should satisfy himself is the hill-climbing power of the vehicle submitted to him. It is not necessary that the car should take its full load up a steep hill, but it is essential for satisfactory touring that ordinary hills should be taken at a fairly good speed, and without having to shed any of its passengers. Many automobiles are so under-powered—that is, the weight of the carriage body and load is too great for the power of the motor—that on a hill of any length or height they cannot pull their load at a speed of more than four miles an hour. The buyer should insist on a hill-climbing test in his presence. After this purchasers would do well to take the time over a mile on the flat, to see that the car as geared for hill-climbing will also make good time on the level.

An engineer's shop is to be established in connection with the Sheen House Club, so that repairs to members' motor-cars can be done on the premises under competent supervision.

MR. J. BROUGHTON DUGDALE has been re-elected president of the Midland Automobile Club. The new committee consists of Messrs. Austin, Millership, Dixon, Cox, Palethorpe, Siddeley, Crowdy, Holder, and Chatwin.

HERE AND THERE.

In replacing the outer cover of a motor pneumatic tyre great care is necessary to avoid pinching the air tube. There are many motorists who consider that nearly all damage to air-tubes is caused by external objects, and that nails in particular are the worst enemies of the pneumatic tyre, but it has been proved by experience that many cases of tyres bursting have been due to pinched air-tubes. There are two kinds of pinches; pinching the air-tube between the cover and the rim (Fig. 1), and pinching it between the cover and the valve stem or the safety belt. To minimise the risks of pinching in mounting the tyres it is necessary with ordinary inner-tubes to have their section smaller than that of the inside section of the covers, so

FIG. 1.

FIG. 2.

that when the tyre is inflated the air-tube is fully stretched and, therefore, in the worst condition in case of perforation. Fig 2 shows an air-tube designed to avoid pinching, which can be made of such a size that, even when fully inflated, the rubber is not extended, and will be in the best condition to close a puncture and avoid rubbing against the walls of the cover. It is known as the "Compoid," and is manufactured by Messrs. Falconnet, Perodeaud and Cie, of Choisy-le-Roi, France, who claim for it many advantages and that it does not diminish the resilience of the tyre nor increase its weight in an appreciable manner.

AN order for a 35 h.p. Mors car has, it is announced, just been placed by the King of the Belgians.

THE Wurttemberg Engineering Society has decided to affix a memorial tablet on the front of the residence of the late Herr Gottlieb Daimler.

A MORNING journal tells of the new enthusiasm of the Pope for automobilism; but is it so new? We believe Leo XIII. had his first motor-car ride about two years ago.

MESSRS. ROTHERHAM AND SONS, of Coventry, who are making a speciality of lubricators and other small accessories for motor-cars, have sent us a copy of their price-list of the same.

SO much has already been written in these columns about the Nice-Abbazia-Nice race that it must now suffice to remind readers that the event commences on Tuesday, the 8th inst.

THE latest entry for the Paris-Vienna motor-car race is that of a young lady, Mlle. de Meuve, who has not contented herself with entering in the tourist division, but will compete in the regular racing class.

A STORY is told of a negro in Alabama who for the first time saw a motor-car. He called his friend and said: "The Yankees freed de nigger, and now I beliege they have gone and freed de mule."

M. LE GRAND, of Levallois, near Paris, has just brought out a new tyre for motor bicycles, the tread of which is covered with thin steel plates, similar to the "armoured" tyres seen on many of the cars at the last Paris Show.

SEVERAL hundred members of the Automobile Club, on sixty-five cars, stayed at Newmarket on Thursday night and left on Friday morning for Cromer; so we learn from a paragraph circulated by one of the news agencies.

THE cost of maintaining a 16-h.p. American-made automobile for thirty days, during which time the vehicle covered 700 miles, has been recently published. It totalled thirty-eight dollars for gasoline, cylinder oil, and glycerine, and included twenty dollars for the month's storage.

A MOTOR-CAR service is being projected between the West End of London and Windsor and Kingston-on-Thames.

THE York City Council is being asked to make special bye-laws regulating automobiles within the walls of the city.

MESSRS. HIGGINS AND Co. are opening a motor-car depository and garage in the Margravine Road, Fulham Palace Road, W.

THE Bridgwater Motor Company, who have been appointed repairers to the Automobile Club, have room on their premises to store seventy cars.

MR. WILLIAM LEA, of Berry Street, Liverpool, will keep his motor-car dépôt open day and night, Sundays excepted, during the coming season.

A PAPER on motor-cars will be read at a conference on rural industries, which the Countess of Warwick is convening at Warwick Castle on May 1st.

PROPRIETORS of garages, repairing depots, and hotels wishing for appointments for 1902 by the Automobile Club should make application before Saturday, the 19th inst.

AMONG the South Coast firms on the Automobile Club's list of repairers is the Brighton and Sussex Motor Car and General Engineering Works, of which Mr. F. Constable is manager.

MR. J. H. YOXALL, M.P., has promised to do what he can "to promote improvements upon highways, which will tend to facilitate the use of mechanical traction for the purposes for which horses are now used too often, because unavoidably, in a cruel way."

THE Archduke Leopold Salvator recently undertook a tour on a 6-h.p. Locomobile *via* Tullnerbach-Pressbaum, Laab, Kalksburg, Mauer, Schonbrun, and up the Gloriette. On the return journey the Archduchess Blanca, with three princesses, entered the car to drive back to the Palace.

PRESSURE on our "Correspondence" columns prevents the publication this week of a characteristic letter from Mr. Joseph Pennell, in which he suggests that Mr. Kennett may care to join him for a portion of a thousand miles trip he intends to take to Florence on his motor-bicycle.

THE manufacture of induction coils for use in connection with the electrical ignition on petrol motor-cars has been taken up by the Marconi Wireless Telegraph Co., Ltd., of 18, Finch Lane, London, E.C. The chief claims put forward in favour of the new coils are—strength, certainty of sparking, economy in current consumption, high finish, proof against damp, and low price. The illustration shows the general appearance of the coils,

which are stated to be absolutely damp proof, a consideration of the greatest importance. Owing to the company's experience in the construction of large coils, specially wound to withstand the trying conditions of wireless telegraphy, it is able to produce a thoroughly trustworthy coil, generating a greater heat in the spark than is attained in the usual type. We understand that the Daimler Motor Company has already placed a substantial order for this type of coil with the Marconi Company.

CORRESPONDENCE.

COST OF MAINTENANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letters on Motor-Drivers, Mechanics and their Wages, I cannot understand any reasonable gentleman expecting to get a mechanic and driver to look after an 8 or 12 h.p. car (not a voiturette be it noted) at the wage of £50 a year. If a man is expected to clean the car properly, also engines, bearings, etc., and to be able to take off wheels, adjust bearings, chains, and see that engines and parts are kept clean and in good order, also to understand the engines, etc., should they stop or not give off their proper power, is it not better to have a man who understands these various parts and is able to adjust them on the road than to have to keep writing or sending to makers for the least thing that should happen which causes delay and waste of time?

Should the gentleman take great interest in his vehicle, and have time to look after his engines, etc., then he certainly does not want a mechanic, but a man just to clean car, oil, and fill up, etc. For this kind of work the man could not expect more than 18s. to £1 a week. If you want a practical man to look after a car, keep it in good order, and to do repairs, then you cannot get one for 18s. a week. If a car is worth paying £600 to £800 for, I should think it is worth looking after. My experience is that people who own motor-cars seem to forget that their men like one day a week to themselves. Instead of that, Sunday is generally as long as any other day. Perhaps this is one reason why they expect a little more than 18s. a week.

Yours faithfully,

W. R. R.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—To a man of no mechanical knowledge the parts and system of a motor-car appear complicated, but to the handy man with a desire to learn, it is very simple, as in all good makers' cars the parts are interchangeable. The aspirant who will content himself with a 4½ h.p. car carrying three or four up most gradients, and running over the legal limit, content with say 3,000 miles a year, ought to do it on £1 or £1 10s. per week. The only simile I can give is the yachtsman (proper) who wastes money, and the more practical amateur yacht owner, who gets as much pleasure at two-thirds of the cost of the former. With regard to the engineer refusing to help a fellow motorist on the road because this poor fellow only paid his engineer 18s. a week, it reflects no credit on either the owner of the car or the engineer.

My advice, after over two years' experience, is:—(a) Buy a simple car; (b) As parts are all interchangeable any ordinary mechanic under your direction can replace them; (c) solid tyres for the driving wheels, pneumatic front; (d) drive yourself; (e) When in trouble that you cannot find, send for a man who has interest in your car, pay 15s. to £1 per diem and travelling expenses.—Faithfully yours,

AUGUSTUS KENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been wanting to get a small motor-car, but have been waiting for the exhibition in April before deciding which one to get. On reading in the *Journal* for March 18th, the letter from "A Motorist," a doubt occurs in my mind as to whether I can stand the annual expense. I have always thought that if I could get over a first outlay on the car I should get on well and have good times, but now my eyes have been opened by his letter, and I can see I have to face a still greater outlay in expenses, with the result that I am doubtful about getting one at all.

I also notice in the *Journal* a statement that the cost of repairs for the second year is £6 to £7,—compare this with the other. The more I read, the more I think myself like the lively ball of the table, knocked from end to end until I am afraid I shall be knocked out altogether.—Yours truly,

ONE IN DOUBT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to a letter in your columns from Mr. Mawdsley Brooke, I fail to see his reason for keeping a man to fill his water and petrol tanks, and grease cups, because if the owner be a man who thoroughly understands his machine, and is also a thrifty person, I wonder he does not let the £50 per annum accumulate. What is more ruinous to a rising industry than to see a car in charge of one of these cheap men being towed along with a horse, through some trifling failure, which a man paid a decent wage and who understands his work would have put to rights very quickly.

The wage Mr. Brooke suggests is not equal to that of a carman, whose work requires no special knowledge or skill, who at the same time has no Sunday work and fairly regular hours, which a motor driver does not. I could give numerous instances in which a cheap man has practically ruined a car, costing the owner in the long run a good deal more than the extra wage paid for a competent man, under whose care such things would not have occurred.—Yours truly,

A PRIVATE DRIVER.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to my letter of the 8th ult., I should possibly, for the benefit of your less practical readers, have been more explicit, and have to thank Mr. Pennell for calling my attention to it; 2½ in. by 2½ in. would be the diameter of piston and length of stroke respectively, which, with the size of the discs (or flywheels), we may call the vital part of the motor from the power point of view. Horse-power is nowadays a very vague and variable term. That motor-bicycles of moderate weight, well under 100 lbs., and not above the foregoing dimensions, can and are being built capable of doing good work on a journey of more than fifty miles without trouble, as Mr. Pennell remarks, is confirmed by a communication I have just received from Zurich, where a friend arrived on his Trent motor-bicycle after having done 650 kilometres, and with no trouble whatever, not even a puncture.—Yours faithfully,

A. E. BOOKER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with interest Mr. Swinton's "Experience with Motor-Bicycles" in your issue of the 22nd ult. I have ridden a "Werner" with engine in front of handle bar over 3,000 miles and find it a thoroughly reliable machine, my only drawback being the tendency of the large belt rim fixed on the road-wheel to get out of line owing to the fastening clips giving with the pull of the belt; in resetting the fasteners either work loose or snap off.

This winter I have had fitted by Messrs. Evan Jones and Sons, cycle makers, Carnarvon, a new driving-wheel, with the belt rim built in the spokes, which is much stronger, and a decided improvement on the Werner method. Since the alteration was made I have had no trouble whatever, and I have already travelled some 500 miles, 100 of which were covered through two and three inches of snow in a hilly district at an average rate of fifteen miles an hour.—Yours truly,

G. H. JONES.

CRACKED WATER-JACKETS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent, "W. B.," who wishes to know if there is any means of repairing a cracked water-jacket, I may say that if the crack is situated in a part of the cylinder with a clear space free from projections, such as valves, bosses, etc., a thin steel clamp may be used, drawn together at its ends with a bolt and nut, and packed where the crack is with thin sheet asbestos covered with white lead. If, however, the crack is so situated that it is impossible to fix a band round the cylinder, it is advisable to carefully fit a plate over the crack, securing it to the wall of the jacket with small screws, and packing with asbestos and white lead. The holes for the screws may be drilled right through the shell, and if the screws are made a good fit in the holes and the packing is carefully done there will be no leakage. This method also has the advantage of strengthening the damaged part, especially if the crack be round the cylinder. Many cylinders are made so light in the wall that the outer shell of the water-jacket (when cast in one piece with the cylinder) gives a large amount of support in resisting the force of the explosion, especially in the case of premature firing.—Yours truly,

JOHN W. SMITH.

QUERIES RE PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers kindly inform me what they think is wrong with my International Charette? I can get a very good spark on the plug, but only a very feeble explosion, although on advancing the sparking I can get a fairly good backfire. I have varied the mixture, but it only answers with the lever in one place. The accumulators are fully charged and ignition seems all right. I use Pratt's motor-spirit. I have tried two or three different plugs with the same results in each case.—Yours truly,

ST. NICHOLAS.

LIGHTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have for nearly a year driven a car carrying at night two Dietz lamps, each showing a white light ahead, and a small red light in rear, and have never been challenged for carrying insufficient lights.

When purchasing the lamps for a new car I was warned that it is obligatory to carry a red light on the off rear end of the car, and that the small red spot lights in the backs of the front side lamps do not comply with the regulations of the Board of Trade.

These latter provide that:—"A motor-car must carry a lamp (not two) attached to the extreme point of its off-side, free from all obstruction to the light, and so constructed as to show a white light to the front, and a red light behind."

I shall be glad of opinions as to whether I am more correct in maintaining that if the side-lamps have red spot lights in the backs, and are not obstructed by wings or otherwise, they are sufficient, and that no third lamp is necessary.—Yours truly,

CHARIOTEER.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—Referring to Mr. G. Henderson's letter in the issue of the 15th ult., I cannot see why he should suggest that the Wolseley car does not compare with French productions. I think it is far ahead of French makes for its price and finish. It is made to wear. Speaking of horizontal engines, I can say after five years' experience there is little or no fault to find with them. Perhaps Mr. Henderson will explain the disadvantages, etc. I think if Mr. Henderson was to ride on a two-cylinder car with horizontal engine, either Wolseley or Benz, he would soon change his opinion; and this is the reason why they are not so out of date as he thinks.—Yours truly,

W. RANDOLPH.

BREAK-DOWNS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Doc's" letter, in your issue of the 22nd ult., I venture to give a few hints as to temporary break-downs. In the first place, owners of cars should study their machines so as to be thoroughly conversant with them. Do not forget to turn on the petrol tap and switch on electricity, seeing that the small connecting plug is in its place. The mixture is found by turning starting handle and moving mixture lever backward and forward. If then you cannot start, examine sparking plug by taking out and laying on any metal part of engine, care being taken that the part connected with high tension wire does not touch the motor. Turn handle or fly-wheel of motor round slowly with current on. If the spark is a fine healthy one it is all right, but if feeble your batteries may be getting low. Another cause of a feeble spark is that the wire to earth may be broken or disconnected. If so, it must be repaired or replaced immediately. If there is no spark at all, examine battery with a volt or ampere-meter. It should not register less than $2\frac{1}{2}$ amperes. If batteries are all right examine trembler, which is the most frequent cause of stoppage, due to oil getting between the platinum on trembler and platinum-tipped screw. The best way is to take trembler off, and scrape or file the platinum clean. See that all wires are intact and terminals screwed up tight. If spark is satisfactory, and you cannot then get a start, examine carburettor. If a spray, the small apertures that convey the petrol into carburettor may have become stopped up, or carburettor may have flooded through float leaking and filling with petrol, sinking it, and so letting petrol get above its proper level. See that the petrol spirit is of the proper density. In summer it should not be of more than 70 and in winter 68 specific gravity at a temperature of 59 deg. Fahr. This is important, as there exists a difference of eight-tenths of a degree in the density of the petrol for every degree of temperature.

Missfires may be due to: 1. Batteries running down; 2. Trembler wanting adjustment; 3. Broken porcelain; 4. Broken wires; 5. Sooty plug, through bad mixture or too much lubricant; 6. Bad spirit; 7. Bad mixture; 8. Motor overheating; 9. Loose terminals.

Sudden stoppages may be due to: Keys in either valves jumping out, broken valves, exhaust valves jamming, loose terminals, exhaustion of petrol supply, high tension wire becoming disconnected from plug or carburettor getting flooded. Of course, there are other causes of getting hung up, due to secondary things, but these are the principal causes of non-working.—Yours truly,

J. H. DICKINSON.

MECHANICAL FLIGHT UP-TO-DATE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent Mr. Fred Crockett, alluding to my current series as above, remarks: "I feel so far pleased to know that I have not been working on the wrong lines in my experiments." As Mr. Crockett proposes experimenting on buoyancy or ballooning lines, and as his remark implies that I favour such lines, I wish him to grasp the fact that I repudiate any such advocacy absolutely. I thought some of the past chapters had expressed my conviction on that point unmistakably. Let Mr. Crockett refer to the chapter on "Anti-Levitation," as it appears doubtful whether he can have read it. In remarking that "I have been interested in the study of mechanical flight," &c., Mr. Crockett, in a manner, contradicts himself: balloon propulsion is not mechanical flight. The former system stands no chance whatever of being the ultimate means of aerial transit. If Mr. Crockett becomes a convert to the cause of legitimate mechanical flight, i.e., aviation, I shall be glad to advise him further as to choice of motor, or anything else on the subject he may wish to know.—Yours faithfully,

SIDNEY H. HOLLANDS.

ELECTRICAL IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is with somewhat mixed feelings I have followed this correspondence in the *Journal*. The state of things electrical in motor-car and cycle work was brought vividly to my notice, however, a week ago by being called in by an acquaintance of mine in connection with his coil and spark-

ing troubles. A few minutes' examination put the matter right—simply a wrongconnection, and want of a little expert adjustment. He is now delighted with his "fat" spark. In your issue of the 22nd ult., I notice the plaint of "Seven Horse," who wants to go back to tube ignition. But given the right material to begin with, there should be no worries with electrical ignition gear. If those not acquainted with electrical apparatus were just given a few simple explanations and rules to follow by an electrician who is an expert on induction coils, the bulk of these "mysterious" failures would disappear, and the undoubted advantages of this method would be more fully realised, and in a measure give confidence in an industry which has every need of real help from its well-wishers. With this end in view, I shall be happy to give any advice or help on this matter to those who are experiencing electrical difficulties.—Yours truly,

ROBT. HORNBY.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the report of a meeting of manufacturers and sellers of motor vehicles, held at the Automobile Club on the 20th March, Mr. S. F. Edge is said to have stated that the Automobile Mutual Protection Association, Limited, was not open to all members of the trade; the statement was not only inaccurate, but Mr. Edge was, of all people, least justified in making it, inasmuch as some months ago he wrote me saying he would like to join the Association, and asking what was required of him to enable him to do so. I not only gave Mr. Edge all particulars, but told him I would be pleased to put his name forward for election, if he would fill in a form of application for membership which I sent him. This form he never made use of.

I need only add that, with but one exception, no candidate for election has been refused admission to the Association, and in the case referred to the Committee considered that the person in question was not a member of the motor industry, and entitled to admission under the regulations.—Yours truly,

GEO. R. HELMORE, Sec. A.M.P.A., Ltd.

Mr. Edgar Soames replies to "W. B.'s" inquiry as to repairing a cracked water-jacket by saying that he repaired a somewhat bad exterior fracture with red lead.

MOTOR-CYCLE TRIALS.

THE Motor-cycle Trial organised by the Metropolitan District Association of the Cyclists' Touring Club and the Automobile Club of Great Britain and Ireland is to take place at the Crystal Palace to-day (Saturday) at 4 p.m. The meeting is open to motor-bicycles of any horse-power, and motor-tricycles not exceeding $2\frac{1}{2}$ h.p., that is, the cubic contents of the cylinders must not exceed 19.9 cubic inches. No prizes are offered, and no certificates will be given, but records of the consumption of fuel, non-stop, and speed on hill, and general results, will be published. Competitors must be on the ground within the cycle track at the Crystal Palace with machines at 4 p.m., otherwise they may be disqualified. The stewards of the Automobile Club will then fill up petroleum spirit tanks completely. Motor-cycles will then be ridden 20 miles on the Crystal Palace track. This will not be a race, and no records of time will be taken, except that if the time taken by a motor-cycle in completing the 20 miles exceeds one hour it will be disqualified. Pedalling after the motor-cycle has crossed the starting line will not be permitted. The use of the pedals after starting will disqualify. If a motor-cycle stops on the track after starting it will be disqualified.

On the completion of the 20 miles the machines will be ridden directly off the track without dismounting, and will proceed up Rock Hill, turn at the top, descend, turn at the bottom, and repeat the ascent twice, making three ascents in all, and return without dismounting to the track enclosure. Pedalling will be permitted when the motor-cycle leaves the track, but if the motor-cycle be ridden up the hill without the use of pedals the fact will be recorded. Stopping or dismounting from the time the motor-cycle leaves the track enclosure until its return will disqualify unless the stop be caused by traffic or for other reasons admitted by the observers. On returning to the track enclosure the consumption of petrol spirit will be measured and recorded. Exhaust boxes must not be removed or opened.

LEAVING CARS ON THE FOOTPATH.

EVEN motor-cars must not be left on the footpath opposite one's own house. This was the discovery made at King's Heath Police Court by Charles Thompson, residing at Heron Gate, Alcester Road, King's Heath. He left the car on the path for over thirty-five minutes. He was indignant at being told that he would be reported, and he kept the car for another quarter of an hour in the same position. In turning round in the road he nearly ran the policeman down. The defendant denied the insinuations of the officer, and said that owing to the lamp giving him some trouble he had to leave the car there longer than he expected. He was fined 10s., and 8s. 6d. costs.

FURIOUS DRIVING CASES.

At Hove, Richard Greenhill Silverlock (15), of Sackville Road, Hove, denied having driven a light locomotive at a speed greater than was reasonable and proper, having regard to the traffic on the highway, in Old Shoreham Road, Hove, about five o'clock on the evening of the 5th ult. Evidence in support of the information was given by P.C. Walter Easton, a Hove constable, who said defendant was driving a motor-bicycle to which a chair was attached. In the chair was defendant's mother. The constable said the bicycle went 200 yards in 15secs., which witness said worked out at the rate of about twenty-seven miles per hour. Defendant was fined 5s. and 12s. costs.

At the Salisbury County Petty Sessions, Robert Standish Sievier, of Elston House, Shrewton, was summoned for driving a motor-car at a greater speed than was reasonable and proper, so as to endanger the lives and limbs of passengers, on the highway at Downton, on February 13th. Mr. A. Whitehead, for the defence, contended as there was no evidence to prove that his client was the driver of the car, the case should be dismissed. The magistrates, however, imposed the full penalty of £10 and costs.

THERE was a renewal of motor-car prosecutions at the Chertsey Petty Sessions last week. H. S. Halford, Kensington; Herbert Froy, Court Field Gardens, S.W., and B. Dodson, Long Acre, London, were summoned for furiously driving motor-cars in Oatlands Drive, Weybridge, on March 8th. A fine of 20s. and costs was inflicted in each case.

ANDREW FLETCHER, who was described as of the 2nd Life Guards, was summoned before the Brighton Borough Bench for furiously driving a motor-car on the Grand Junction Parade on March 15th. Police-constable Ranger said about 3.30 on Saturday afternoon he was on mounted patrol duty on the Grand Junction Parade, where he saw a motor-car being driven at a furious rate. He estimated the speed at from sixteen to eighteen miles an hour. Witness put up his hand, and shouted to the driver to stop, but as no notice was taken he had to gallop after the car. It slowed down somewhat, and when witness caught it up the driver steered it into the centre of the road so that it struck the hind quarters of the horse. The car was travelling at a pace much too fast for the safety of the public. George Morant, staying at the Hotel Metropole, said that when the constable galloped after the car it was going about twice as fast again, and it would have been impossible to catch it unless it slowed down. The Mayor said the Bench were quite satisfied that the car was being driven at much too rapid a rate, and defendant would be fined £5 and costs.

FREDERICK PARRISH, motor-car driver, Melton, was summoned at the Melton Mowbray Petty Sessions for driving his car furiously on the highway at Kirby Bellars on the 7th ult., and also with driving without a proper light on the 14th ult. at Melton, and further with driving backwards on the latter occasion. Mr. G. Rowlett appeared for the police, and stated that the defendant was not allowed by law to drive more than twelve miles an hour. Superintendent Mantle deposed that he was driving from Melton Mowbray to Kirby Bellars when defendant came towards him at a rate of eighteen to twenty miles an hour. The Bench retired to consider their finding, and on their return inflicted fines amounting together to £2 10s.

ROBERT M'GILWIE, 1, Thistle Place, Edinburgh, was fined £3, at the Edinburgh City Police Court, for furiously driving a motor-car. The accused has been previously convicted, and on the present occasion he collided with a cable car.

At Daventry Police Court, Leo Bryan Tucker, of Coventry, was fined £5 and £1 0s. 6d. costs, for driving a motor-car through Daventry above the rate of fourteen miles an hour. Henry Longland, a farmer, of Newnham, said defendant passed him on the Birmingham road, travelling at twenty to twenty-five miles an hour. He gave no alarm, and witness's horse was so frightened that it bolted, smashed a lamp-post, and broke the shafts of the vehicle. Defendant did not stop to see what had happened, and consequently witness telegraphed to the police of the next town, Towcester. Police-constable Benson also stated he saw the car travelling at the rate of twenty miles an hour. Defendant said he blew his "hooter" on passing Longland, and slowed down to three miles an hour. The magistrates observed that by Longland's telegram it was proved that defendant went the eight miles from Weedon to Towcester in a little over a quarter of an hour. It was a bad case, they said, made worse by the defendant not stopping when he saw the accident.

A. H. DOWSON, of Keynsham, was summoned at the Bristol Police Court for furiously driving a motor-car. The police said he was travelling at the rate of 22½ miles per hour, but the defendant stated that he was not going at more than ten miles an hour. The Bench imposed a fine of 40s. and costs.

FREDERICK BERSEY was defendant in an adjourned summons at Brighton, which alleged that he drove a motor-car at a greater speed than was reasonable and proper on King's Road on the 8th ult. A plea of guilty was entered. P.C. Sheppard estimated the speed at which defendant was travelling at 18 miles an hour on King's Road, about 11.30 in the morning. The Mayor said just now Brighton seemed to be a happy hunting ground for motor cars, and defendant would be fined £5 and costs.

W. L. CREYKE, of Oxford, was summoned at the Abingdon County Petty Sessions, for driving a motor car at an excessive speed, in Sunningwell, on March 11. He pleaded guilty to driving at a rate of

more than twelve miles an hour. P.C. Ponsford said he timed defendant, and found he covered 530 yards in thirty-five seconds, or at a rate of more than thirty miles an hour. A fine of £10 was imposed, with 8s. 3d. costs.

A MOTOR-CAR MYSTERY.

WALTER BRANDON, of Gordon Mansions, W.C., has surrendered to his bail at Marlborough-street Police-court, London, to answer the remanded charge of having caused an obstruction in Great Windmill-street, W., with a motor carriage on the night of the 18th ult., and reported in the JOURNAL on the 22nd ult. It was alleged by the police that on the night in question a motor-car was left standing outside the Trocadero Restaurant from five minutes past eleven till five minutes past twelve, causing a great obstruction to the traffic. The police sent into the restaurant several times asking for the driver, and were informed that he refused to come out and take it away. Eventually Mr. Brandon came out, and the police asked him if he were the owner, and he said he was not, but it was alleged, admitted that he had been driving it. Mr. Brandon was eventually taken into custody and charged with causing an obstruction with the motor. On the case coming on for hearing, Mr. Staplee Firth, solicitor, appeared for the defence. After hearing evidence at great length, Mr. Denman said it was a difficult matter when a motor-car was left like that in question to find out to whom it belonged. The police appeared to have done what they could to ascertain who was the owner, but the evidence called for the defence showed that Mr. Brandon had nothing to do with it. A mistake had been made, and the charge must be dismissed.

THE Auto-Carriage Company, Ltd., are removing from Great Portland Street, W., to larger and more convenient premises at 15, Newman Street, London, W., where a repair department for Bardon cars is being established.

THE French Chambre Syndicale de l'Automobile has adopted a recommendation that the mechanism of a motor-vehicle should be so arranged that no part projects above the upper plane of the frame. This decision has been arrived at in order to avoid the necessity of hollowing out or cutting away parts of the body which would impair the strength of the latter.

ACCORDING to the decision of a French court, the manufacturers or agents of automobiles, or their agents, must supply the *permis de circulation* as an accessory. It appears that a Frenchman bought a motor-car of the Paris agent of a foreign manufacturer, but the *permis de circulation* was refused because the model was not approved by the expert engineers appointed *ad hoc*. Thereupon the court, upon being appealed to, decided as above.

IN connection with the International Exhibition to be held at Cork this year, an artistic souvenir has been issued which should do much to attract visitors to the city on the Lee and motorists to the south of Ireland. Every year sees an increased number of motor-cars in the Emerald Isle, and this illustrated souvenir, which has been published for the Exhibition authorities by Messrs. Guy and Company, Limited, will prove useful as well as interesting. While we must regret that the jaunting car will have to go, it is satisfactory to know that the vehicle to supersede it will not cause pain or trouble to the jarvey's faithful friend for so many generations.

THE Motor-Car Journal.

Vol. IV.]

LONDON, SATURDAY, APRIL 12, 1902.

[No. 162.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AS Saturday, the 19th inst., draws near the thoughts of motoring enthusiasts are more than ever concentrated on the Exhibition which will then open at the Agricultural Hall, Islington, N.—a place within easy reach of all the great railway termini, and therefore one that is likely to attract a large number of provincial motorists who are sure to take this opportunity of seeing the most complete and representative collection of motor-cars ever got together in this country.

The Exhibition.

In addition to the display of automobiles from all the leading European countries, as well as from the principal British works, there will be some features of considerable interest, notably a dirigible balloon fitted with a Buchet motor. In steam and electrical vehicles, as well as in petrol cars, many new ideas will be shown for the first time.

The Prince of Wales.

THE interest of the English Royal family in motoring has been so strongly shown of late that it will occasion no surprise to learn that the Prince of Wales has signified his intention of visiting the forthcoming Exhibition at the Agricultural Hall. Last year's display of automobiles attracted a large attendance of public men and leaders of Society, but this year's Exhibition will probably eclipse all its predecessors so far as a representative attendance is concerned. In determining to visit the Exhibition the Prince of Wales not only gives further evidence of his interest in the sport, but also his desire to see the automobile industry in a thoroughly prosperous condition.

Dinner at the Exhibition.

On the Wednesday of Exhibition week the Automobile Club will hold a dinner at the Agricultural Hall, to which members and their friends are invited. The tickets will be 5s. each, and can be obtained on application to Messrs. Cordingley and Co., at the Hall during the Exhibition, or from the steward of the Automobile Club. It will be remembered that it was at one of these Exhibition dinners that Sir Francis Jeune made his first memorable speech on the delights and pleasures of automobilism; and although the list of speakers has not yet been arranged, it may be taken for granted that the high level of previous years will be fully maintained.

Collapse of the Great Race.

GREAT was the surprise at the announcement in last week's *Journal* as to the possibility of a collapse of the much-anticipated Nice-Abbazia-Nice race. Unfortunately the possibility materialised into a certainty, and great was the consternation amongst Continental automobilists when it became known that the race had been prohibited. After all the preparation that had been made and the great expense to which French manufac-

turers had gone in connection with the matter it seems a wanton piece of irritation on the part of the Italian authorities to throw obstacles in the way of a contest at the last moment.

Some Reasons.

MR. BALLIN HINDE, who is making a motor-car journey from Frankfort, via Nice, to London, has just returned from a journey over the Italian portion of the course which was to have been taken in the Nice-Abbazia race. He reports that the North Italian roads are narrow, irregular, and sinuous, the major portion of the route requiring the greatest care in negotiation. The peasants with their market carts on such roads present an ever-recurring danger. Quite unaccustomed to automobiles in any form, they are incapable of judging in any way the speed of an approaching car, and it is upon them in the narrow channel before they with their unmanageable wagons can get clear.

Why not Before?

ALL this is urged on behalf of the Italian authorities; but it was as equally true when the matter was first mooted as within six days of the event, and it is this action of the Government at the last moment that all interested in the matter naturally complain of. Makers had gone to enormous outlay, with a view to the contest, in building more than sixty new racing cars as well as in establishing extensive storage and repairing premises at Nice, and at various Italian towns, and, finally, in paying the expenses of the drivers of the machines, and of armies of mechanics, engineers, and skilled workmen, who have been sent to the Riviera. The Automobile Clubs of France, of Nice, and of Turin had, moreover, disbursed money to provide for the arrangements of the contest, and this outlay has all been thrown away. M. Serpollet's lament is not exceptional when he says, "Two hundred thousand francs I have thrown out of the window."

A Strange Difference.

Two cases heard at Chelmsford—the one immediately after the other—illustrate the obviously unfair way in which motorists are treated in many parts of the country. In this particular instance a Leytonstone engineer, driving a motor-car at a speed which was said to be eighteen miles an hour, was fined £5 and 10s. 6d. costs, whereas a drunken carman in charge of a horse and cart and similarly charged was let off with a fine of 10s. and 3s. 6d. costs. Surely we are not to infer that a sober motorist is to be regarded as more dangerous than a drunken carman. Curiously enough, we have since seen the report of a case at Wimbledon, where a motorist charged with being intoxicated and driving a motor-phæton to the common danger, has been fined only 40s. including costs.

Club Trials.

ELSEWHERE we give some of the regulations and classifications which have been agreed to by the Races and the Trials Organisations Committees of the Automobile Club. It has been proposed to hold these trials in September, but the Committee which is advising the Club with regard to electrical vehicles recommends July as the most suitable month for the

competition of electrical cars. Steam cars will have a place in the forthcoming trials, and marks will be deducted for stops made for fuel or water, but the cause of stoppages will be published in the results.

Steam Cars in Australia.

A MELBOURNE correspondent informs us that Australia has been invaded by the Locomobile Company of America, a representative of that concern having recently arrived with twenty-three vehicles. Agencies have been established at four different points, viz.: New Zealand, Sydney, Brisbane, and Melbourne, and it is stated that all the cars were disposed of within four weeks. He then took steamer for China, where he expects to meet another consignment of his company's vehicles. Our correspondent continues:—"The great drawback to motor-vehicles in Australia is the high price of petrol, a difficulty which must be overcome, and which ought to be easy enough to do by a proper arrangement for buying and shipping. We are very much in the dark here as to which is the better, steam or petrol vehicles for general purposes. I had about made up my mind to get a petrol car, but since the new steamers arrived I have almost been persuaded from my first love and think that I will now wait for more information on the subject."

MR. F. OWERS AND MR. S. H. PEARCE ON THE FORMER'S
18-H.P. DAIMLER.

Provincial Representation on the A.C.G.B.I.

FOR some time the leading provincial clubs have felt that metropolitan influence overwhelms country opinion at the committee meetings of the Automobile Club, and representations on the subject have lately been made. These have been considered by the Club Committee, who have made inquiries which show that the present day of meeting (Monday) is the only day in the week that suits the existing members of the Executive Committee. Under these circumstances the Executive Committee has agreed "that if any representative of a provincial Club on the Club Committee could see his way to attend on Mondays, and would be willing to sit from 5 o'clock until midnight every Monday, he should be appointed immediately a vacancy occurs on the Executive Committee." Whether this will be agreeable to provincial representatives remains to be seen.

The Chicago Exhibition.

GREAT success seems to have attended the Automobile Exhibition recently held at Chicago, and the exhibitors were well satisfied with the results. Not only were the public anxious to see the novelties, but the manufacturers were equally desirous that their employees should see the show, and thus become fully equipped with knowledge of the most modern types of cars, etc. Several makers sent their foremen and leading workers, paying their expenses on a liberal scale, so that they should learn what competitors were doing. The idea illustrates the keenness of business methods in the United States, and will probably find imitation at the Exhibition which opens at the Agricultural Hall on Saturday, the 19th inst.

Motor War Cars.

COLONEL CROMPTON and others have shown the War Office the value of mechanical traction in offensive operations, and now Mr. F. R. Simms is emphasising the utility of motor-vehicles in defensive schemes. Last Friday at the Crystal Palace he gave a demonstration of the war car described on another page, and he must be gratified with the attention which the Press has bestowed on his invention. Sir Fortescue Flannery, M.P., was among the visitors, and recognised the ingenuity with which the arrangements have been devised to secure storage capacity for ammunition as well as safety for the gunners. In the course of a brief speech to the company, Mr. Simms drew attention to the fact that although the King is not alone as a Royal motorist, he is the only head of the State who also owns a racing stable—a distinction that affords another proof of the interest that sportsmen have in the automobile.

Prosecutions in Surrey.

SURREY has an unenviable reputation—or rather notoriety—among motorists, and the vigorous action of its authorities against steam-vehicles still continues to cause expense to the county with no result—save to cause motorists to avoid many of the Surrey roadways. The latest instance of the absurd character of the persecution now going on has just occurred at Dorking, where Mr. Payne, of the Carlton Hotel, has been summoned under the old Locomotive Act, his steam-vehicle having been blowing off steam—an offence that seems to incur the wrath of the Surrey police to an inordinate degree. Once previously at this bench a fine had been imposed; but Mr. Payne was fortunate in obtaining the services of Mr. Staplee Firth for the defence, with the result that the summons was dismissed. We believe that about thirteen similar cases have been dismissed, and that Surrey is the only county in which such prosecutions take place. In an interview with Mr. Halsey, the Chairman of the Surrey County Council, that gentleman says that that body is not responsible for these silly and expensive prosecutions. There is a joint committee of the magistrates and the Council who have the necessary authority to undertake such prosecutions, but we should like to know who is actually and directly responsible in the matter.

A Scottish Agitation.

AT the last meeting of the Brechin District Committee, Mr. John Shiell brought up the question of motor-cars being run on the roads in Lochlee parish. The roads there were very narrow, and people walking or driving were in danger of their lives when they met a motor-car rushing along. Mr. Smith said that that was more a matter for the County Road Board to deal with. Mr. Soutar asked if the drivers of motors were bound to stop when asked? He said he had often held up his hand as a signal for the drivers of the vehicles to stop, but they paid no attention to him. He had also remonstrated with them, but as most of the drivers in Glenesk were Frenchmen he was afraid they did not quite understand his broad Scotch. It was ultimately agreed to bring the subject under the notice of the County Road Board.

**The Automobilist's
Spring Cleaning.**

In another part of the present issue we reproduce an article by Mr. A. L. Clough, in the *Horseless Age*, the perusal of which can be strongly recommended to all motorists. That motor vehicles, like all other pieces of mechanism, will get out of order and require repairing is to be expected, and the advice given to spend a little time on a general overhaul of one's vehicle ere summer, with its warm, long days, is upon us, will, if followed, conduce largely to the pleasure of the many enjoyable runs that motorists have in prospect.

**The Friend
of
Horses.**

AMONG those who are devoted to animals, the Rev. F. Lawrence, hon. secretary of the Church Society for the Promotion of Kindness to Animals, is well known as an advocate of everything tending to mitigate the troubles of animals. In a circular recently sent out to the branches of his society, as well as to individual sympathisers, he writes:—"I submit for universal acceptance that the general use of motor-cars will contribute to the benefit of horses, who will be better treated and more highly thought of, and no longer called upon to perform such drudgery as dragging heavy loads up steep ascents." With this view of the case every automobilist will be found in accord.

**The Demand for
Mechanics.**

WE have received an interesting letter from a mechanic, who comments on the difficulty there exists as to finding good mechanics in connection with automobilism. He cannot endorse, from his own experience, the statement that good mechanics are in demand, and says he was stranded in a West of England city. An advertisement was inserted several times in many engineering journals offering his services as a good all-round machinist understanding motors. Since then he has approached a number of motor-car manufacturers—all to no purpose. Regretfully he comes to the conclusion that good men are not so much in demand as he had been led to believe. At the same time, while giving expression to these views, we must repeat that the trade does find a difficulty in getting really reliable and efficient mechanics. The number of men in this country with a thoroughly practical knowledge of automobile matters is comparatively limited.

Electrical Critics.

WHY cannot our contemporaries devoting space to electrical investments, vehicles, and similar matters, maintain a businesslike attitude towards petrol and steam cars? They never seem so happy as when decrying petrol cars; certainly they would be better employed in keeping to the matters about which they are supposed to know something than in criticising one form of automobilism that is making great headway. So far as we are concerned we welcome electrical and petrol steam vehicles with equal pleasure, because it must be recognised that there is a niche for all, and that each has its peculiar features rendering it valuable under certain conditions. But to attempt to assert (in the present state of the industry) that only one form is really valuable is absurd.

**Impartiality
Necessary.**

THAT every form of motive power should be encouraged is a statement that finds assurance in the new classifications for steam and electric vehicles which are being made in connection with the automobile contests to be held this spring by the Long Island and the American Automobile Clubs. There will be classes for electrical vehicles capable of covering 100 miles without the necessity of recharging, and also for steam vehicles able to run 100 miles without the renewal of water. This fact alone demonstrates the advance that has been made

during recent months, and shows how ridiculous are the critics who would seek to disparage steam, electricity, or petrol in connection with automobilism.

**Motor 'Bus
Services.**

MANY provincial towns are as much in need of efficient and reliable motor-bus services as is London, and we are glad to see suggestions in advocacy of such innovations are being made in several places. Outside our own little island, too, interest is being taken in the subject, and we hear from Shanghai that the Municipal Council there is prepared to receive offers for a motor-omnibus concession. Whether this will be arranged on equitable terms we will not venture to say, but the fact that such a venture has been mooted is significant of the forward policy that is characteristic of Eastern countries.

Weak Points.

THOUGH we sometimes see descriptions of cars in which weak points are absent, such desirable vehicles are rarely to be met with in a material form, and the lines on which a large proportion of the advance made during the past few years has proceeded, consist in the suitable and convenient location of such parts as must "go" under continuous wear or abnormal strain. The coming of the pneumatic tyre, the weak point *par excellence* of the modern car, is chiefly due to its being a preferable victim to road inequalities rather than that wheels, springs, or machinery should suffer, and its eminent suitability for roadside repair. The adherence of a minority of two or three makers to the belt as an item in the transmission mechanism may well be due to the same reason. Two mishaps to a car which recently came under our notice are a good illustration of the advantage of having weak points in convenient places.

AT THE BELL HOTEL, TRETTFORD.

**Further
Examples.**

THE car was one in which the application of the foot-brake did not disconnect the engine, and a sudden stoppage to avoid a collision resulted in the shearing of a rather weak key connecting the engine shaft with the gear—no very troublesome repair, which was made apparently with a stronger key to avoid a repetition of the mishap. Shortly afterwards, similar circumstances, same neglect to ungear; result, a badly-stripped driving sprocket. Of course neither need have occurred, and neither reflected on the car, but it is certainly preferable that the part to give way, even with careless driving,

should be an easy one to replace. In another case, a pump firmly connected to the driving shaft broke one of its pump-cogs, and, of course, was jammed to destruction; while in another car we recently saw, the connection, also a direct one, avoiding the trouble of friction wheels, etc., was made by a simple wire staple, which, though amply strong enough to drive, would certainly give way and save the pump in case of its jamming. The worst point about gear-driven live axles is that the bevel gear, usually the first part to "go," is an inconvenient and expensive replacement; one might almost suggest that weakness in the shaft or its universal joints would be preferable; while in such minor matters as studs, a weak centre that would avoid the necessity of drilling out if broken commends itself as a minor consideration in building a "fool-proof" car.

A WRIT of *fi. fa.* is in the hands of the Sheriff in respect to the taxed costs in connection with the Maybach carburettor case of the British Motor Traction Company, v. Friswell. The company was registered with a million pounds capital and, we understand, there are debentures outstanding in the hands of Mr. H. J. Lawson and others.

ON Wednesday, before the Association of Engineers in Charge, at the St. Bride Foundation Institute, London, E.C., Mr. W. Hollamby read a paper on "Self-Propelled Road Vehicles." Mr. Percy Richardson, London manager of the Daimler Company, presided.

A NEW catalogue of the Weston steam cars comes from 14, Mortimer Street, W. It gives illustrations and descriptions of the Stanhope, Victoria, and dogcart phaeton vehicles, as well as of the heavy touring car recently referred to in these columns. The Weston water lift is also fully described, and the catalogue will be of interest to all contemplating the purchase of a steam car.

LAST week a new 10-h.p. car was delivered to its owner at the works of Georges Richard at noon, and with four passengers started in the pouring rain on a journey to Marseilles. It rained in torrents for the first day and a half; so much so that the occupants were obliged to buy new clothes, as they were wet to the skin. On Saturday night they slept at Montargis, 87 miles from Paris; on Sunday, at Bourg St-Andeol they passed through snow a foot deep, and spent the night at Valence, 397 miles from Paris. On Monday, noonday, they arrived in Marseilles, 554 miles from Paris, having averaged 25 miles per hour, notwithstanding the adverse climatic conditions.

THE latest production of the Milwaukee Automobile Company, of Milwaukee, U.S.A., is a steam touring car with a tonneau body. In general appearance the vehicle closely resembles a petrol car, the boiler being located under a bonnet in the fore part of the frame. The boiler is of semi-flash pattern, similar to that used in the torpedo boats in the U.S. Navy. It comprises 526 feet of $\frac{3}{4}$ inch tubing, and has a steaming capacity of thirty-two boiler horsepower. Steam is delivered at a normal temperature of 400 degrees F. Sufficient water is carried for a run of 150 miles. The burner is of the Clarkson type, but modified, and possesses radical improvements over the original. Paraffin is used as fuel, the supply carried being fifty-two gallons. The engine is a compound condenser with central valves, and is entirely jacketed. Working as a simple engine it develops 26-h.p., and as a compound 13-h.p. A feed water heater which delivers the water to the boiler at a temperature of over 212 degrees is fitted. All lubrication is by force feed from one reservoir. Another novel feature is a system of variable speed gears, giving three speeds. The normal gear gives a ratio between the engine and driving wheels of two and one-half to one. A hill-climbing drive gives a ratio of four to one. For racing purposes a third gear is provided of one and one-half to one. Other new departures in steam cars are the adoption of inclined wheel steering and artillery wood wheels. We may add that Messrs. Shippey Bros., the British agents, have a number of these cars on order, and hope to be able to show one at the forthcoming Exhibition.

THE NICE WEEK.

NICE has this week been quite busy, from an automobile point of view, although the interdiction of the Nice-Abbazia-Nice race has taken a good deal of interest out of the event. The week was opened on Sunday with a battle of flowers in the Jardin Public. Numbers of beautifully decorated cars took part, and the route was lined with distinguished people. On Monday the annual hill-climbing competition from Nice to La Turbie, over a hilly course of 15½ kilometres, was held. The contest was divided into eight categories, viz.:—(A) Motor cycles weighing less than 50 kilogrammes; (B) motor-cycles weighing between 50 and 100 kilogrammes; (C) light racing cars weighing between 250 and 400 kilogrammes; (D) racing cars between 400 and 650 kilogrammes; (E) racing cars between 650 and 1,000 kilogrammes; (F) touring cars weighing between 400 and 650 kilogrammes; (G) touring cars between 650 and 1,000 kilogrammes; and (H) touring cars over 1,000 kilogrammes.

Considerable disappointment was evinced when it was announced that the Panhard racers would not take part in the competition, which was further adversely affected by the heavy fog which hung over the route. In Class A, Williams was first, his time being 22min. 2 4-5sec. Osmont on his De Dion tricycle was first in Class B, time 18min. 6 3-5sec. In the other sections, the fastest times were made as follows:—Class C, Guillaume, 20min. 20sec.; Class D, Gabriel on a Darracq, 16min. 50 3-5sec.; Class E, Stead on a Mercedes, 16min. 37 3-5sec.; Class F, Tranchant, 27min. 59 2-5 sec. Class G, Count Zichy, 19min. 20 2-5 sec.; and Class H, Gray Dinsmore, 25min. 21 3-5 sec. It is noteworthy that the first five cars in Class D, racers weighing between 400 and 650 kilogrammes, were all Darracqs.

The triumph of the Mercedes car, driven by Mr. Stead, moved M. Gabriel to attempt the same feat on a 20-h.p. Darracq, weighing 1,300lbs. On Tuesday morning he went for the Nice-La Turbie record, and did the distance in 15min. 46sec., beating the previous best by 51sec. He had, however, the advantage of clear weather as compared with the fog of previous day. On Tuesday and Wednesday the various cars were placed on exhibition in Nice, while Thursday was devoted to the annual series of mile contests on the Promenade des Anglais, the results of which are not to hand at the moment of going to press.

MESSRS. DAVIS, ALLEN AND COMPANY having accepted the challenge of the Birmingham Motor Manufacturing and Supply Company, a hill-climbing and speed trial between the Mitchell and Rex motor-bicycles is to be held near Coventry this (Saturday) afternoon.

ON a stony road at the Parc d'Achères, near Paris, the Hon. C. S. Rolls, on Wednesday, beat the French automobile record for the kilometre by 6½ seconds with a flying start. He attained a speed of sixty-five miles an hour on a 28-h.p. Mors car, the time being taken by the official timekeepers of the A.C.F.

IN addition to the new 22-h.p. car which the Daimler Company are building for the King, there will be on view at the Automobile Club's exhibition to-day (Saturday) week, the car upon which Dr. Lehmann intends to tour round the world. As already announced, this tour will begin at the Agricultural Hall, on the 23rd inst. During the past week the travellers have been taking spins around Paris on their car and attracting universal attention.

THE firm of Georges Richard are giving steady deliveries to their customers of their new 10-h.p. and 20 h.p. cars which were the object of so much attention at the last Paris Exhibition. Their London agents, Messrs. Mann and Overton's, Limited, will exhibit at the forthcoming exhibition at the Agricultural Hall, the first four of these new cars imported into England. The 10-h.p. car weighs a little over 13 cwt., and has two cylinders, three speeds and reverse, and is gear driven and chainless, whilst the 20 h.p. has four cylinders, and is also chainless, and weighs complete with body about 17 cwt. The first 20 h.p. to come to England has been purchased by Mr. Isidore Clifford.

MECHANICAL FLIGHT UP-TO-DATE.*

BY SIDNEY H. HOLLANDS.

CHAPTER VI.—*continued.*

TO advert now to the next class in order—the wing or flapping type of propeller. The very earliest record we have of the application of wing-propellers is that of the mechanical dove of Archytas (who is also the reputed inventor of the kite) living 400 B.C. This is rather remote and legendary, but if true it antedates the aerial screw by about two thousand years. The old, old story of the winged Dædalus and Icarus is far too mythical and impossible for further comment, and is now worn quite threadbare. Wing and screw propellers have been held to belong to the same class. Their respective functions and working conditions, however, differ so that they must be classed separately. Apart from the fact that, while the one is vibratory and intermittent, the other is rotative and continuous, the wing is not only a propeller, it is a propeller-sustainer, while the screw, or rotating fan is not, the function of the latter being propulsion only. So-called "ascensional," or lifting screws (rotating on a vertical axis) may at once be summarily and finally dismissed as a *practicable* means of flight. We now know, and the fact is recognised by the best authorities, that this oft-proposed system is the most extravagant of any in its demand for power. Besides requiring an enormous power ratio, this system, of course, derives no assistance from gravity and air-inertia (as systems of true flight do), but exactly the reverse. In short, horizontality of propulsion (together with high velocity of transit) may be said to be imperative to economical flight.

Hitherto, the best results have been obtained with screw-propulsion, *i.e.*, screw-propelled inclined aerocurves (Langley), in which the total load sustained and propelled was 30 lbs. for one actual b.h.p., and it is claimed for the Maxim aeroplane machine that a total weight of 28 lbs. was lifted and propelled for each b.h.p. These results are so far highly satisfactory, in that they have proved indisputably the practical possibility of true mechanical flight; but they have by no means conclusively proved that the rotating screw or fan is the most efficient propeller, particularly when we remember that the rival winged system includes sustentation (in part at least) with propulsion. We have not yet been enabled to make a fair comparison of these two systems. No winged machines comparable at all in size or in power with the screw-propelled machines of Langley and of Maxim have yet been constructed. The best wing-propelled machines that have yet been made (using steam motors, too) are the admirable "Hargrave" models. (Mr. Hargrave has also made and tried screw-propelled models.) These have actually made considerable flights for models, and—I think and hope Mr. Hargrave will pardon my saying—in spite of a rather rudimentary and inefficient form of wing. These results, among others, have led me to hope great things from wing and "wave-action" propulsion.

When we turn to the birds, we find that instead of a total load of only 28 or 30 lbs. sustained and propelled per actual h.p. expended on it, we have in the pelican 230 lbs. per actual h.p. This, it must be said, however, is the highest weight ratio yet found in nature; the comparatively small allowance of power for weight in this bird indicates, too, that it derives exceptional aid from the extraneous natural forces, and we must contrive to follow its example. When we come to the pigeon we see that it is comparatively a very powerful bird, having at the rate of one actual h.p. per 45 lbs., and yet the Langley "aerodrome" had and needed a 50 per cent. higher power-ratio than even this.

These facts look very encouraging for wing propulsion. It is only logical to attribute this marked disparity, at least in a great measure, to the higher efficiency of winged systems. I am fortunately enabled to give some interesting particulars of the

performance of the best and largest of Mr. Hargrave's winged models, *viz.*, "No. 17" (illustrated in the previous chapter). Its total weight is 4 lbs. $\frac{1}{2}$ oz., including 5 ozs. weight of fuel (spirit) and water; the wings swept through arcs of 112 degs. at a speed of 140 double-strokes per minute, which produced a horizontal thrust of just one pound, the effective power was 166 ($\frac{1}{8}$) actual h.p. The maximum range of flight, limited by supply of water and fuel, was 1,640 yards. Thus we see that we have here a practicable, though small, steam winged aviator, with a power ratio of one actual h.p. per 24 lbs. of total weight, and the probability that with an improved form of wings much better results still would be obtained.

Reverting now to the "wave-action" type of propeller-sustainer, this ingenious system is analogous to the undulatory locomotion of the skate, and other flat fish. It was introduced by that earnest and veteran aviationist the late Frederick W. Brearey, B.Sc., about twenty-two years ago, who gave numerous lectures on it, with successful demonstrations by models, all over the country. The prime mover in these little machines consisted of stout indiarubber strands in torsion, one machine being of such size and power that it was hard work for one man on a winch to wind it up, no better motor then being available. At the best, this form of motor gave but very short duration of flight, as for an equal duration of power it was much heavier than the beautiful light steam motors

A GROUP OF SCREWS AND OTHER OBJECTS EXPERIMENTED WITH. (MAXIM.)
Note—Some of the above are *embryo* propellers, but are all of the same diameter, and their resistance to rotation (severally) was compared with that marked U. (UNITY.)

now have available for that type of machine, but which at that time unhappily were not. A motor that I subsequently designed specially for Mr. Brearey's machine—and only shortly before his decease—is illustrated in the preceding chapter. The "wave-action" system is described in Mr. Brearey's own words as follows:—

"A surface is provided according to the weight to be carried, the supporting surface of a parachute being known. Placed upon a truck, so that its position shall be horizontal whilst run down inclined rails, the fabric will be inflated by the upward pressure of the air, and the wave arms raised to that point where their further elevation is restrained by the pectoral cords. The machine will naturally float away from the incline, and the occupant must then set his motor in action. The downward blow of the wing-arms will cause the wave fabric attached thereto to imprison a mass of compressed air, and the following wave will force it along the underside of the fabric. This will cause propulsion. The return or upstroke cuts off and diverts from the upper part that air which, but for the rise of the wave-arms, would flow over the back and shunts it underneath, whilst that which is embraced in the concave fabric following the upstroke is thrown off in a wave to the rear above the machine and so on alternately."

* All rights reserved.

THE VICTORIA MOTOR-BICYCLE.

THE latest motor-bicycle to appeal for public favour is the Victoria, of which an illustration is given herewith (Fig. 3). A novel feature of the engine is that the cylinder is bored from the solid steel bar, the radiating fins being turned up in the lathe. The diameter of the cylinder is 70 mm., and the stroke 72 mm.: the engine, which is fitted with an outside fly-wheel weighing 15 lbs., and having a diameter of twelve inches, is claimed to give off $2\frac{1}{2}$ actual horse power on the driving rim. The exhaust valve is actuated by a special two-to-one reducing gear, as shown in the illustrations of the motor (Figs. 1 and 2). A special ball valve permits the air to escape out of the crank case without forming a cushion resistance against the working of the piston. As this escaping air generally carries oil with it, a nickel-plated pipe is fitted, which leads the oil drop to the ground behind the bottom bracket, but just outside the path of the tyre. The lubrication of the cylinder is carried out by means of a tongue, which licks the oil inside the crank case and throws it up into the cylinder. Provision has been made so that no trace of oil can reach the sparking plug, which is located in the centre of the combustion chamber. The normal speed of the engine is 1,600 revo-

FIG. 1.

FIG. 2.

lutions per minute. Either a surface or spray type of carburettor can be fitted. Electrical ignition is employed, the induction coil having a special silk insulated cable, wound by a new process. The high-tension wire is about $2\frac{1}{2}$ inches long, and does not touch the frame at any point. The frame or earth wire is only one inch long, so that, with the exception of the switch wire, no wires run along the frame. As will be seen, the motor forms part of the seat tube of the machine, and drives the rear wheel by a $\frac{3}{4}$ inch round twisted chrome belt. A jockey pulley is arranged to slide up and down, to allow the belt to be easily adjusted by the displacement of a hexagonal nut. The machine is being put on the market by Messrs. Brandes and Perkins, of 178, Lockhurst Lane, Coventry, who claim that a speed of forty-four miles per hour can easily be reached on the level, and that no hill, provided the belt is well adjusted, is too steep for it to climb.

In case of petrol becoming accidentally ignited, it is useless to try to extinguish the flame by means of water, as the spirit will float on it and continue to burn. Dry sand is very effective as an extinguisher, and a supply should be kept constantly on hand where petrol is stored or used.

CONTINENTAL NOTES.

BY "AUTOMAN."

IN twenty years' time, when the leader-writer of the day sits down to chronicle the rise and progress of automobilism, and to hold up to public ridicule the then incomprehensible opposition which it had to encounter and surmount at the opening of the twentieth century, the most startling fact to point back to will undoubtedly be the extraordinary veto put on the Nice-Abbazia-Nice motor-car race, at the eleventh hour, by the ill-advised Italian Government, who have already begun to regret and to fear the consequences, which may be far reaching. The most unexpected consequence is the storm of abuse levelled at the devoted heads of the Government by almost every section of the French press, who, forgetting that they are somewhat responsible for the course of events, owing to their attitude over the unfortunate accident in the Paris-Berlin race, are unloading vials of printed wrath, and with one accord dubbing the Italian Government, and all that pertains to it, with the opprobrious title of "Muffe."

THE history of the affair is interesting. In the first place, and in reply to a letter addressed to him by the Baron von Zuylen, president of the A.C.F., the Minister of Public Works wrote, on January 21st, from Rome, as follows to M. le President de l'Automobile Club de France, to inform him "that I have watched with sympathy the steps taken by the Automobile Club of Nice, and seconded by your honourable association, and that as far as possible I am willing to remove all difficulties, in order that the projected race may be a success. I will give special orders along the route, with the exception of special precautions and eventual responsibilities in case of accidents." On the 22nd of January the Minister wrote to Count Biscaretti di Ruffia, president of the Automobile Club of Turin, as follows:—"The Minister of the Interior has communicated to me your letter concerning the coming race for automobilists from the frontier to a city in the kingdom not yet determined. I am inclined to free the participants from the observance of the law of April 28th, 1901, but, in order that I may give instructions to the prefects, I must know the towns on the route."

ON the strength of these letters it was publicly announced that the race would take place, and the Italian Government cannot possibly have been ignorant of the fact that it was being organised and that large sums of money were being lavished on it. The papers all the world over talked of it, and all went well until April 2nd—just six days before the start for Abbazia—when the Minister of the Interior withdrew the permission. The Baron de Zuylen immediately telegraphed to the Minister, but received no reply. After waiting a couple of days he telegraphed as follows:—"Giulitti, Minister of the Interior, and Zanardelli, President of the Council of Ministers, Rome, beg to point out painful impression and indignation felt by numerous manufacturers, who, trusting in the word of the Italian Government, have sacrificed large sums of money in view of the Nice-Abbazia-Nice race, authorised by letter of January 22nd. This prohibition, coming at the eleventh hour, when more than 100 vehicles have been made specially for this race, is such a fragrant violation of the most elementary laws that we are still confident in the good faith of the Italian Government, and trust you will still withdraw the veto." It was not until the evening of April 5th that the following reply arrived:—

"By telegraph to-day, the Minister of the Interior begs me to reply to your telegram addressed to Rome, and which he received at Cavour, and by which you requested him to revoke the order vetoing the automobile race across Italian territory from Coni to Abbazia. I have to say that the race has been forbidden because the conditions laid down by the Minister of the Interior have not been observed, namely, not to use roads on which there were steam tramways, or to cross communes on fair or market days.

Public opinion being very much against races of this kind, which have already caused damage and are very dangerous in countries where the population is thick, the veto is absolutely irrevocable."

FURIOUS is not an adequate word to describe the condition into which the French manufacturers were thrown. Austria has not yet consented to authorise the Paris-Vienna race, and fears are freely expressed that the Italian prohibition may incline the Austrian authorities to follow in the same direction, so that the year's effort will be a dead loss. There is only one remedy possible. The French Government cannot stand idly aside and look on complacently at the injury of a great industry, due to a hasty decision, brought about by the imprudent speech of M. Gautier de Clagny at the time of the Reims accident. The revulsion of feeling has already begun, and there is already a governmental automobile race authorised. To save the trade from disaster they will almost be compelled to step in and authorise the Paris-Vienna race on French soil, and a side wind says that after the elections it will be done. In the meantime the *rapprochement* between Italy and France has

HIGH EXPLOSIVES IN MOTORS.

THE problem of using high explosives as a source of energy has always been a fascinating one, but the difficulties and dangers besetting the path of the investigator in this line have hitherto rendered progress almost imperceptible, though since the days of the early "gunpowder motor," consisting of a fan-wheel actuated by the blast from an explosion-chamber fed with charges by its rotation, such ingenious though unpractical devices have appeared as the Bourdon tube motor of (if memory serves) M. Tatin, in which a cartridge was fired at each stroke, actuating the mechanism of a model flying machine by the consequent pulsations of the Bourdon tube, and the somewhat mythical Pennsylvania production of five years ago, in which a bicycle motor 3 in. by 1 in., worked by powder of some kind, was said to give one h.p. The question, however, has acquired an additional interest in view of the reported use of picric acid, one of the best known of modern explosives, by one of the competitors in the recent French consumption trials,

FIG. 3.—THE VICTORIA MOTOR-BICYCLE. (See opposite page.)

suffered a severe blow, because every Frenchman, whether automobilist or not, is deeply offended.

THE London Motor Garage Company, Limited, has been registered, with a capital of £20,000, to carry on business as storers and repairers of motor cars and cycles, etc.

MESSRS. STERN BROTHERS are now producing a new oil for super-heated steam which, they inform us, will stand a temperature of over 800 degrees Fahrenheit. The oil is pure hydrocarbon, and is said to be particularly suitable for Gardner-Serpollet cars.

MESSRS. J. ROTHSCHILD AND FILS, LIMITED, has been registered with a capital of £4,000 to adopt an agreement between Rheims Auscher and Company (representing J. Rothschild and Fils, of Paris) of the one part and A. R. Lucas of the other part, and to carry on business as manufacturers of and dealers in motor-cars, etc.

and though no very definite information regarding the experiments in this direction are available as yet, some remarks on the substance in question may claim a certain amount of general interest, as well as laying a desirable emphasis on the risk attaching to incautious experiment in such a tempting field.

Picric acid, or trinitrophenol, is a substance obtained by the action of nitric acid on carbolic acid, and thus bears a certain analogy to nitro-glycerine, though its explosive properties remained long unrecognised. If gently heated it may be melted (at 120 deg. C.) and even vapourised, the vapour burning without explosion. If, however, it is heated suddenly, as by throwing on a red-hot plate in small quantities, it explodes, while its salts, as potassium and ammonium picrate, are even more explosive, the latter, mixed with potassium nitrate, forming Brugère's powder. The pure acid, though not easily exploded alone, does so violently if ignited by a detonator, and a special point to notice is that with some metallic oxides, and even with a few fragments of lime, it becomes capable of violent explosion. This sensitive-

ness to the action of oxides may obviously prove a source of risk to its use in motors. It does not leave any residue on complete combustion, but this is not attained without the addition of an oxidising agent, which, as increasing its explosive force, would probably be quite inadmissible for motor purposes, and the question as to what residue, and whether a dangerous one, might accumulate under such conditions of use requires investigation. It is soluble in 100 parts of cold water, and also in either alcohol and petroleum, though to what extent in petrol does not appear, while its temperature of explosion is said to be 2,620 deg. C., and its heat of combustion 618 calories.

The advantages which may accrue with modern high-speed motors by the admixture of substances with the normal fuel which increase the rapidity as well as the force of combustion is obvious, but an ample course of experiment with stationary motors, with particular reference to indicator readings, to discover whether danger may be apprehended from irregular, oscillating, and excessive explosions (as has been the case with acetylene motors), is desirable before taking them as companions of the road—lest the ardent motorist, or what is left of him, find cause to echo the motto of the sixteenth century alchemical compiler:—

"Crede ratem ventis, corpus ne crede chimistis :

Est quaevis chimica tutior aura fide."

R. W. BUTTEMER.

THE "SEER" TRANSPARENT SPARKING PLUG.

MR. G. CALVERT, 12, Woodville Road, Mildmay Park, N., has been experimenting for some time past to produce a transparent sparking plug, enabling the spark to be seen when under compression. After abandoning several types, he has hit upon an arrangement which, after trials, he claims to be thoroughly satisfactory. Referring to the sectional illustration given herewith, the main shell of the plug is of the usual De Dion type, the difference being in the insulator employed.

This is tubular, and is closed at the inner end only; it is made of a specially annealed fireproof glass, such as is used in chimneys for incandescent gas lights, and globes for incandescent electric lamps. The high-tension wire is fused through the glass, and is perfectly proof against leakage. It then passes along the inside of the tube, and is turned over at the end, and secured by a band slip, to which the high-tension wire from the coil is attached. By looking down the tube the spark can be plainly seen and tested under compression. The insulator is adaptable to any De Dion plug. Mr. Calvert adds that he has found that glass is not nearly so liable to harbour a deposit as porcelain, nor so liable to breakage when properly annealed.

A CYCLE dealer at Dalkeith, Mr. Walter Young, who has just been a bridegroom, has created some local excitement by utilising a motor-car for his wedding party. This is said to be the first motor-car wedding that has taken place in Scotland.

MR. E. KEYNES PURCHASE is acting as hon. architect and surveyor in connection with the new premises of the Automobile Club. It is hoped that these will be illuminated with Bleriot lamps during the Coronation festivities.

AMONG new members of the Automobile Club are Prince Dolgorovki, Earl de Grey, Messrs. W. J. Bull, M.P., P. S. Foster, M.P., J. Gretton, M.P., W. H. Allen, M.R.I., and H. E. Esmond, Major H. L. Sapte, and Captain Bowman-Manifold, R.E.

A RUN INTO CORNWALL.

A PARTY of four—Mr. Edmunds and his son and manservant, and Mr. Crampton—left London on the car "Antrona," a 10 horse-power Daimler, on March 19th, leaving Streatham at 2 p.m. They travelled *via* Kingston, Staines, towards Windsor, and intended going through Windsor Forest, Bishops Gate, to Forest Gate, thence to Reading, but were informed at the Park gate that motor-cars were not allowed. So they had to divert their course, running through Windsor on to Reading, arriving there at 4.40, a distance of about thirty-five miles. The day was bright and fine, and the roads dry and dusty. Capital running was made after leaving Reading on to Newbury, a distance of seventeen miles, where the party stopped at the old coaching inn, "The George," while tea was being prepared. Losing no time, as night was approaching, "Antrona" left Newbury at 6.10, running through Hungerford at 6.45, thence through the lovely forest of Savernake. The sun had just set, a brilliant moon was shining, and the forms of the startled deer, as they heard the approaching car, made a picture not easily forgotten. As the car neared Marlborough lamps were lighted before leaving the forest, for under the shade of the trees and high banks it was very necessary to have the full power of the Bleriot assisted by three oil lamps. It is under conditions like this that one appreciates the value of the acetylene flame. Marlborough was reached, then Calne, and on through Chippenham, where the sleepy inhabitants seemed much startled and interested as the car passed swiftly on to Box. A lovely run on top speed down the roads, which were in splendid condition, into the old city of Bath followed, "Antrona" arriving about 9 o'clock at the New Empire Hotel. The car was put up for the night at Stuckey's stables, and the party, somewhat dusty in appearance, presented a strange contrast to the good folk in evening dress seated in the lounge of the hotel.

The next day revealed a great change in the weather. It was very disappointing to look on the wet roads and roofs from the hotel windows, and it was decided to wait till the weather cleared somewhat, and make use of the time in oiling and cleaning the engines and changing the sprockets, as it was reported that a very hilly district awaited them. A spare pair of new chains and nine-tooth sprockets were substituted for the elevens, and subsequently the party felt they were amply justified in making the change. On replenishing the petrol tanks, which were completely filled before leaving London, it was noted that only four gallons had been consumed during the journey to Bath. Messrs. Fuller, coachbuilders, placed their very commodious showroom at the disposal of the party for carrying out the work on the car, and much interest was taken by the various employees in the proceedings. A somewhat hurried visit was made to the cathedral and the old Roman Baths, and had not time been very pressing some of the party would certainly have got into hot water (from the natural springs). Bath was left, after a very enjoyable lunch and long cigars, supplied by an admiring Norwich friend, who professed to be almost persuaded to automobili-m. though no man more devoted to horses lives in his county, where the party were invited to visit him with the motor-car at the earliest opportunity.

The place to fully appreciate the value of hill-climbing sprockets, powerful engines, brakes, and everything under control, was never more apparent on the whole run than on the road between Bath and Wells. Through the heavy rain falling on the dust-coated roads, a peculiar condition of slime had been produced that was most treacherous and difficult to negotiate the car over, and consequently very slow travelling was made. At one time the hail and wind storm was so severe that the car had to be turned round and stopped, so that the hood formed a protection against the elements. Fortunately, the rain ceased, and "Antrona" proceeded very carefully down the tortuous hills into the old cathedral town of Wells, where it arrived at 5.45. A break in the clouds and a bright gleam of sunshine enabled a fair photograph to be taken from the car of the beautiful cathedral, with its wonderfully carved west front. Passing under the old

gateway the cathedral close was reached. A halt was made of a few minutes, and a consultation held, to consider whether the party should proceed, or stay the night at Wells, in consequence of the unpromising weather and the vile state of the roads. It was decided to push on, and the quaint old town of Glastonbury was reached in about 30 minutes, the roads, though wet, having a good safe surface. A call for light refreshments was made at an inn, where the party was so hospitably welcomed that they were almost persuaded to stay the night, and when persuasion did not avail, they were warned as to the difficulty of the roads and the bad condition for running on to Taunton in the dark. Neither persuasion nor warnings prevailed, however, and, with a view to making up for lost time, "Antrona" departed at top speed on to Street, a town which apparently takes its name from being one long continuous street for two miles, with houses on each side, and dusk coming on it seemed as if one would never get to the end of it. After this a very monotonous run on narrow roads, over a greasy surface, with miles of hedges and ditches, was made over Sedgemoor, until the Bridgwater road was reached; here again the good quality of a well-made road was much appreciated while running in the dark to Taunton. The last few miles seemed interminably long, and it was difficult to distinguish in some places between roads and walls, and but for great alertness a serious mistake might have been made at a railway bridge, where a parapet wall, being of the same colour as the road, was nearly run into.

At Taunton the manager of Claridge's London Hotel gave the party a most hospitable welcome, and though 8.30 at night, he provided an excellent repast for the hungry travellers, taking especial pains when he learnt that it was a birthday anniversary for the senior member of the party.

Next day the weather looked somewhat more promising. Before leaving Taunton the works of the Newton Engineering Company were visited, and the courtesy of Mr. Hickley, the manager, much appreciated. Himself a motorist, he took great interest in the car, which he supplied with petrol and other small items. Here "Antrona" was weighed on the weighbridge, turning the scale, when empty, at 27½ cwt. Taunton was left at 10.45, the roads being in fair condition, and the scenery very interesting through the lovely district between Wellington, South Appledore, and Cullompton. They were now nearing Exeter, making good running, with roads of excellent surface, but the sky looked threatening, and just before entering Exeter encountered an almost cyclonic dust storm. Evidently here the rain had not fallen; the dust was so dense the car had to be stopped a few seconds, as it was impossible to see the road. One noticed that in this district the horses seemed very frightened, and the drivers even more so, evidently not being accustomed to the new mode of travel. A capital lunch was excellently served at the old Royal Clarence Hotel, facing the cathedral, which was reached at 1.15, a distance of thirty-three miles from Taunton. At 2.45 "Antrona" started again, going down the main street of Exeter, with its steep grade, crossing the bridge over the river Exe, then ascending a very stiff long hill to Crockerwell, over roads of good surface, though, like many in Devonshire, none too wide, and with many turns; and great caution was necessary in going at top speed with so limited a view of the road ahead. The country was now getting wilder and grander, there were many hills with stiff grades, and the roads had patches of unrolled stones, amounting in the aggregate to several miles, between Crockerwell and Okehampton. It is impossible to adequately describe the conditions, apparently tons of stones, many of them being three or four inches cube, and simply dumped down on the road, covering like a blanket the whole width of the road, not unlike a railroad in course of construction before the top-dressing or sleepers are laid; and it was here that one realised the value of the Collier Twin tyres, which, though they had been running without attention, in fact ever since put on the car in November last, stood bravely up to their work, and showed that they had come out unscathed when the car arrived at Okehampton at 4.45. This quaint little out-of-the-world town is evidently keeping up with the times, as the hotel

was electrically lighted. When the party stopped for tea the people were much interested in the car. A glance at the Contour maps will show the heavy grades and hilly district through which "Antrona" was travelling, but the roads were fairly well laid, and the surface, though wet, not slippery here. The weather had broken, and the car was travelling alternately through heavy rain and patches of bright sunshine, and skirting Dartmoor as the evening was coming, some of the cloud effects and distant views were magnificent. Again many patches of stones were met, but, fortunately, without any bad results. The quaint old town of Launceston came into view about 6.45; this is literally a city built on a hill, the ruined old castle at the top being visible for many miles. The steep road down to the bridge of the river Tamar was in a very greasy condition, and but for careful handling a sideslip would have been certain, it being only prevented by most judicious application of brakes and very slow running. Crossing into Cornwall a long stiff hill with a horrible surface of wet

THE ARRIVAL OF THE "ANTRONA" AT FALMOUTH.

slime was encountered, and it was with considerable feelings of thankfulness that the party reached the top safely, passing under the old gateway, catching a glimpse of the wonderfully carved granite walls of the old Launceston Church. Running along narrow winding streets, "Antrona" was brought up in front of the White Hart Hotel at 7 o'clock: here rooms were obtained and dinner ordered. As the car was being driven round to the coach-house adjoining, an enterprising agent for petrol, Mr. Prockter, appeared, and expressed every readiness to supply the necessary requirements for "Antrona" as regards petrol, lubricating oil, and carbide. It was particularly gratifying to note, when so far away from one's base, that people were sufficiently interested in automobilism to thus cater for the wants of the motorist. It was surprising to see how little lubricating oil—less than a quart—was wanted to replenish the stock for the whole run from London to Launceston, a distance of over 230 miles. This is probably due to the excellent effect of the Estcourt cooler. Though considered unsightly by some, it is certainly a most valuable adjunct in a long run; it obviates the necessity and care of a pump, and, in the case of "Antrona's" cooler, when full only requiring 1½ gallons of water, and during the whole run at no time was a replacement of more than two or three pints of water necessary. Evidently an engine can be overcooled as well as overheated, and much of the efficient running of "Antrona's" engines is due to the Estcourt radiator.

(To be concluded.)

E

MOTOR-BICYCLE TROUBLES AND THEIR REMEDY.

IN view of the increasing popularity of motor-bicycles, a few remarks as to the causes of stoppages and the way to remedy them may not be without interest. Short circuiting (escape of electric current) may be caused by several means, such as the insulating material covering the wires being worn through or worn so thin by chafing against a portion of the tank or frame work that the current can escape from the wire to the frame. Another simple cause of stoppage is owing to one of the terminals or connections of the wire coming loose and the contact not being sufficiently close or firm to pass the current with regularity. A loose contact generally results in a very jumpy gait of

MR. E. H. ARNETT ON HIS WERNER.

the motor and occasional backfires. Wet is a very frequent cause of trouble, water being an excellent conductor of electricity, and if two of the terminals or two of the wires get connected by a film of moisture a short circuit is the inevitable result. If the rider should happen to be riding for a considerable time in the rain the insulation round his wires may get soaked through, and as a matter of course trouble may be expected. It is, however, very easy to avoid electrical and all other troubles on any first-grade motor-bicycle. The rule is, first of all, to test the accumulator with a voltmeter to see that the necessary charge is there (or, if a battery is used, test with an amperemeter), then see that all contacts and connections are firmly made, and that every wire connection is covered and insulated perfectly by the proper insulating tape or rubber supplied by all motor firms for this pur-

pose. Except for a breakage in the wire or a defective induction coil, the rider should, if these cautions be observed, be free from electrical troubles between the battery and the sparking plug. I am assuming that the rider knows about the adjustment of the contact breaker, though, of course, he might possibly have trouble at that part of the machine owing to the platinum points becoming worn down or dirty with oil, in which case the engine would "miss fire," as only a weak current, or possibly no current at all, would pass. Jumpy progression of the machine is also sometimes caused by the platinum on the contact blade or upon the tipped screw becoming loose. The remedies in these cases are very obvious: clean the contact points, or replace with new blade or screw as required.

The sparking plug seems to cause a lot of trouble with some people, but I myself have not experienced this, for with three genuine De Dion plugs I travelled as nearly as I can estimate 11,000 miles during a season and a half. The porcelain of the plugs is, of course, very brittle, and care must be taken not to knock it. Apart from an absolute breakage, the main cause of stoppage is through the plug inside the cylinder getting fouled with soot through an imperfect mixture being used, or more often through there being too much lubricating oil in the cylinder, which oil, getting over the top of the piston head, gets burnt up when an explosion takes place, causing a heavy deposit of soot. When this happens remove the plug and clean both the points of the wires and also the porcelain with petrol and a piece of fine rag, or with a little fine emery cloth. Soot is a conductor of electricity, and if the soot is not removed the current passes through this instead of from wire to wire as it should do to cause a spark. The points of the wires should be about one thirty-second of an inch apart. The switch-handle sometimes gets fouled inside, and requires cleaning before a proper contact can be made. The carburettor is also a cause of stoppage sometimes. In cold weather a "surface" carburettor frequently fails to act if the machine has been left standing for a time. The best way to get started is to procure some boiling water, and, after soaking some rags in the same, wrap the hot rags round the carburettor till the petrol in the carburettor is warm enough to evaporate sufficiently. I have found that the most reliable carburettor, and also the most certain in its results, is one of the spray type as fitted to the new Werner motor-bicycle.

ERNEST H. ARNETT.

ACCORDING to the *Star*, J. H. Martin, the jockey, has a motor-car, "and he clothes himself when driving in a bearskin." Really!

LAST week the King landed at Lulworth, and went by motor-car to Melbury Park, Evershot, the country seat of the Earl of Ilchester, a trip that gave His Majesty typical views of Wessex.

THE opening run of the Motor Cycling Club will take place to-day (Saturday). The meeting place is to be at the Station Hotel, Purley Corner, at 3.30 p.m. to start at 4.0 p.m. Those who elect to start nearer London will meet at Hyde Park Corner (St. George's Hospital) at 2.30 p.m. Tea will be taken at Crawley at five o'clock, and dinner at the Gloucester Hotel, Brighton, at 8.15 p.m., Mr. Mark Mayhew, L.C.C., in the chair. Tickets (4s. each) for the dinner can be obtained from Mr. Anthony Westlake, hon. secretary, 20, Endell Street, W.C., or Mr. G. E. Roberts, hon. assistant secretary, 29, Horsford Road, Brixton Hill, S.W.

ON Thursday last week we had an opportunity of inspecting the first of several cars that the Motor Manufacturing Company, Limited, are building for a public service in South Africa. The vehicle was just on the point of being despatched to the docks, so that we were only able to give it a brief examination. The motor comprises four cylinders, and is of 12 h.p. A new departure is in connection with the governor, which now acts on the admission instead of on the exhaust valves. The radiator, too, is on new lines; it is of the ordinary form, but is inclosed in a casing open at the front and rear, the cooling of the water being accelerated by means of a fan driven off the engine shaft. The carriage body is of wagonette form in natural wood, and has seating capacity for twelve persons. Sirdar solid rubber tyres are fitted to the road wheels.

THE SIMMS WAR CAR.

THE workmanlike appearance of the motor war-car which Mr. Frederick R. Simms has designed was well demonstrated at the Crystal Palace a few days ago. The car has been constructed by Mr. Simms for Messrs. Vickers, Sons and Maxim, Limited, and represents the culmination of nearly three years' experimental work. As will be seen from the accompanying illustration, the car is rectangular in form, and enveloped with armour of crinoline shape, longitudinally flattened, and having a ram fore and aft of an angle of 45 deg. The extreme length is 28 ft., the beam 8 ft., and the height of the armour 10 ft.—this being about 18 in. from the ground. As showing the extreme care and thoughtfulness with which the car has been designed, we may mention that the inside top edge of the armour is filled with half-embedded rollers, thus preventing anyone, even if he succeeds in scaling the sides, obtaining a hold when he gets to the top.

Semi-elliptical springs are used in attaching the armour to the frame of the car. These are mounted on steel trestles, suitably braced and stayed to the main frame. The armour is consequently not rigidly fixed to the car frame, but is separated from it, thus obviating the detrimental vibration imparted by the road wheels to the frame. This is practically the only means of preventing the rivets joining the armour-plates from shaking loose. Distance links are also fixed between the armour and the frame to prevent excessive lateral movement.

The engine employed is of the Cannstatt Daimler type, 16 h.p., and fitted with the Simms-Bosch magneto-electrical ignition and timing gear. The bore of the cylinder is 90 mm., the stroke 130 mm., and the compression 60 lbs. per square inch. Cooling is effected by a Cannstatt marine type cooler. The engine is located in the centre of the frame of the car so as not to impede operations of the crew. Four speeds—1½, 3, 5, and 9 miles per hour—are provided, which can, however, be increased 25 per cent. by means of the accelerator. Power is transmitted to the driving wheels by means of a counter-shaft, on which is fitted the differential gear. At either end of the shaft is a sprocket wheel, and these sprocket wheels drive the rear wheels by means of Brampton chains. The steering is controlled by hand wheel and gear, and

so efficient are the braking arrangements that, when going at full speed, the car can be brought to a dead stop within six to eight yards—a capital performance, when it is remembered that the total weight of the car complete, with armour, two pom-poms, and two automatic quick-firing Maxims and fuel, is 5 tons 12 cwt.

At the back of the rear axle and underneath the main frame is a tank carrying enough fuel for 200 miles, while in the front and rear of the armour are boxed compartments to contain 10,000 rounds of ammunition. There is sufficient platform room for about a score of men, and a specially-constructed rope ladder is provided, which can be drawn in when the car is moving or engaged in action. The Simms war car will doubtless prove useful as an adjunct to the defensive equipment of our coasts.

THE Kingston Motor and Cycle Company, of Kingston-on-Thames, has been placed on the list of repairers to the Automobile Club.

THE ARGYLL LIGHT DELIVERY VAN.

IN addition to pleasure cars, the Hozier Engineering Company, Limited, of Bridgeton, N.B., are now devoting attention to light delivery vans. Fig. 3 on page 102 depicts a vehicle of this type they have lately turned out for a Glasgow firm. It is fitted with an 8-h.p. engine, and is intended to carry a

FIGS. 1 & 2.—ELEVATION AND PLAN OF ARGYLL 8 H.P. CH. SSIS.

load of 8cwt. at a maximum speed of fourteen miles per hour. So far as the mechanism and general construction of the van is concerned, this is identical with that of the Argyll light car described in a recent issue. It need therefore only be mentioned that two types of engines are being fitted, either of which may be had to order—namely, the Simms, fitted with Simms-Bosch ignition, or the latest De Dion pattern made by the Motor Manufacturing Company, Limited. The power is transmitted from the engine to the gear-box by means of a friction clutch of large diameter. Three speeds forward and reverse motion are provided, all actuated by one lever, a cam being used which renders it impossible for any one gear to get into mesh before the other is released. A universally-jointed shaft transmits the power from the gear-box to the back live axle (Figs. 1 and 2). Efficient brake power is provided. The frame of the vehicle is tubular, the rods running along the whole length to make it perfectly rigid. The road wheels are of the artillery type, and in the case of the delivery van are shod with 2 in. solid rubber tyres.

THE Victoria Motor Company, Limited, has been registered with a capital of £2,000, to deal in motors, motor-cycles, etc.

AN enterprising motor-cycle agent in the Thames Valley is offering instruction in the management of motor-bicycles at 3s. per hour, the sums thus paid to be returned to purchasers of machines.

THE Western Section of the Scottish Automobile Club is arranging motor car runs as follows:—May 3rd, to Biggar; June 7th, to Girvan, where the members of the Club will be the guests at the country seat of Mr. Weir, of Cathcart.

THE invention of a brass clamp to fasten the nets to the table in connection with ping-pong is said to have raised a Birmingham brass-founder from a comparatively obscure position to an altitude of prosperity that provides him with the luxury of a motor-car.

THE AUTOMOBILIST'S SPRING CLEANING.

THE approach of spring, which is the signal for a burst of unappreciated activity upon the part of our friends the poets, and which means to them a return of the flowers and the birds, is none the less interesting, though of less romantic concern, to the automobilist. To him the year is divided into two parts, namely, the season when one can use his vehicle with pleasure and the season when one cannot, although there are motorists to whom a long drive in winter is a source of joy; and the significance of spring to him is that it ushers in the former long-sighed-for period. Just as spring cleaning is now the order of the day in domestic circles, at the present time the motorist may well indulge in a complete overhauling of his vehicle preparatory to its season's work.

There are usually quite a number of minor defects about a car, which are tolerated as long as they do not seriously interfere with

of a half-dozen or more separate oil cups, or has become disgusted with the dribble of the lubricant from oil reservoirs packed with wick. In that case he may look about for room to locate a multiple oiler and its necessary piping. If water economy has proved unsatisfactory in past seasons one may be led to seek relief, in this direction, by adding a circulating pump and radiators. And then there is the matter of painting. If the vehicle has seen hard service during the past season, the probability is that it is needed. One should be sure to wait until every bit of mechanical work about the carriage is completed, beyond any possibility of resumption, before any painting or varnishing is done. It requires only a very few slips of the mechanic's monkey wrench to chip off the shining new coat to a state of shabbiness, and the prints of black hands upon fresh paint are not ornamental.

In case there are no special repairs needed or improvements to be added, the spring cleaning resolves itself into a thorough course of inspection, cleaning and readjustment covering all parts of the machine. One is always interested to see in what condition tyres

FIG. 3.—THE ARGYLL LIGHT DELIVERY VAN. (See page 101).

its operation, and which are not serious enough to warrant the loss of use which their cure, in the busy season, would entail. Now is the proper time to look after these with such a degree of thoroughness that their recurrence during the coming season may be next to impossible. If the vehicle has shown any bad habits, it is a favourable opportunity to institute an investigation for the purpose of locating the trouble and applying a suitable remedy. It may be, too, that it will be found upon inquiry that the manufacturers have brought out some useful improvement or attachment, which it may be practicable to install upon the vehicle, and thus, to a certain extent, bring it up to date. The better class of manufacturers will be found ready to give an old customer the benefit of any such new "wrinkle" at a reasonable price, to the end that he may remain upon the satisfied list.

It may be found that the manufacturers have improved their carburettor to such an extent that a change may be warranted. Perchance the owner is weary of filling and regulating the feed

will prove to be, as it is a matter that affects the pocket-book most deeply. The tyres should, of course, have been relieved of the weight of the vehicle during the period of disuse. They should now be pumped up, and, if any one does not hold air properly and the fault is not in a leaky valve, it should be taken off and examined. This is a good time to have wire wheels trued up and to look out for broken spokes. The bearings of the wheels should be thoroughly cleaned, readjusted if there is need, and packed with vaseline or heavy lubricant. It is well to bear in mind that steering gear and brakes are the two special parts of an automobile upon the integrity of which human life depends, and these portions should be given a special inspection. Backlash or lost motion in the steering gear is a most annoying thing and one which inevitably results from long usage. If there has been any nut or screw upon any part of the steering gear that has shown a tendency to work loose, do not tolerate it a moment longer, and do not trust any nut without a split pin to hold it. The brakes, too, are en-

titled to a really painstaking examination. There will be a certain amount of stretch of the pull rods and wear of the braking surfaces to be attended to at the end of a season's use. There should be no "drag" of the brake shoes or straps allowed when the brakes are supposed to be out of action. The utmost care as to the security of all nuts will be well expended here.

Upon almost every car there are usually one or more nuts which seem to have a congenital tendency to work loose, as they are found in that condition at almost every inspection of the machine. It is a favourable time to deal finally with these bad nuts so that they may never again figure in the trouble account. One can deal with bad nuts either by providing split pins, check nuts or set screws, or even by the brutal recourse of heading over the end of the stud. For large nuts that are otherwise incorrigible the application of a set-screw will prove a certain cure.

It is well to take off the chain and put it to soak in paraffin in order to clean it thoroughly. If it is soaked in a pan having a false bottom of wire-netting and the liquid is agitated from time to time, the dirt will collect below the false bottom and leave the chain quite free from grit. The paraffin may then be drained off and the chain given a bath in warm melted tallow, with which has been mixed some graphite of the finest grade. A chain should be examined for stretch, and, if enough wear is found to cause it to run seriously out of pitch, it may be good policy to discard it, and invest in a new one. If the chain is very much worn the probabilities are that the outlines of the sprocket teeth are badly out of shape, in which case it may be best to secure new sprockets, for it is just as bad judgment to put new chains on old sprockets as "new wine in old bottles." If sprockets are to be changed, it is well to consider whether any other "gear" would be preferable. Automobiles are generally geared to meet average conditions, but if a particular car is to be used in a very hilly country, where the roads are bad, it may be good policy, when a change is to be made, to add a tooth or two to the rear sprocket and thus secure a gear better adapted to the conditions; while, if the carriage is operated in a level country, where the roads are fine, and a little more speed is desired, a tooth or two may be dropped from the rear sprocket.

Despite the utmost precautions, a considerable amount of dirt and moisture will be found to have collected in the carburettor and the petrol tank. The carburettor should be disconnected and taken entirely to pieces, and all parts and passages should be thoroughly cleaned. If the needle valve which is operated by the float does not shut off properly it should be ground into its seat until tight. Every drop of liquid should be drained out of the tank and every particle of sediment should be washed out with petrol in order to make a fresh start. The rubber connections of the cooling system may need renewal, as they deteriorate under the action of hot water, and tanks or radiators may have developed slight leaks which demand treatment.

If the engine has been addicted to any bad habits now is the time to try and reform them. There may have been an annoying knock, which can be disposed of, or perhaps the compression, which is the very life and spirit of a petrol motor, may have become weak. The old oil should be drawn off from the engine-crankcase and the reciprocating parts given a bath of paraffin. The bearing of the connecting rod on the crank-shaft should be carefully examined to see if there is any back-lash which might give rise to a "knock." If so, it should be taken up by an adjustment of the brasses, at the same time assuring oneself that the brasses are left in a perfectly secure condition; for a loose connecting rod is a very destructive thing. The main crank-shaft bearings and the bearing of the connecting rod in the piston should be looked after as regards their adjustment and the efficiency of their lubrication. Both the exhaust and the inlet valve should be carefully ground into their seats by the use of emery or quartz paste, if there is the slightest suspicion against their tightness. Care should be taken to see that the jacket water does not leak into the cylinder on account of the cylinder head joint having given out. A general examination as to the lubrication of all parts should be made. Oil cups should be removed and cleaned, so that their

sight feeds may be visible, and all oil-ways should be demonstrated to be clear.

The ignition mechanism deserves its share of attention. If any trouble has ever been experienced from broken wires or short circuits this is a good opportunity to re-wire the carriage. In the general overhauling the friction-clutch should not be overlooked, but should be adjusted carefully.

If the automobilist's spring cleaning and renovating is well done, it will bear abundant and satisfactory fruit in a smoothness of operation and a comparative freedom from trouble during the coming season, and will save many fold the time and trouble spent on it.

A PUBLIC SERVICE STEAM CAR.

THE Mobile Company of America, of Tarrytown, on the Hudson, N.Y., U.S.A., has recently introduced a public service car driven by steam. As will be seen from the accompanying illustration, the mechanical part of the vehicle is similar to that adopted in the now popular light American steam cars, the only difference being a stronger frame,

longer wheel base, and a wagonette body to seat ten persons. A car of this type, with nine passengers, recently made the journey from Tarrytown to New York, a run of twenty-eight miles, in somewhat less than two hours.

MR. W. R. McTAGGART, 102, Grafton Street, Dublin, has been appointed sole agent for F.N. motor-bicycles in Ireland.

"TUITION in roadside repairing" is offered to motorists by a firm in the West End of London. Such information can be given "at your own residence if required." Certainly it is better to do all needful repairs at home than to wait till a public road is reached.

THE Automobile Club of America is arranging for a series of tests over a mile course. The competition will be divided into classes as follows: (1) Motor-bicycles and tricycles; (2) petrol vehicles, sub-divided into three classes, viz., under 1,000 lbs., between 1,000 and 2,000 lbs., and over 2,000 lbs.; (3) steam vehicles; (4) electrical vehicles.

THREE prizes of respectively £500, £250, and £100 are being offered by the German Ministries of Agriculture for the best military tractors operated by alcohol motors, the vehicles to be of home construction and to be capable of hauling a load of fifteen tons at an average speed of five kilometres per hour. Entries close on January 1st next, and the trials are to take place in February, 1903.

A COMBINATION BALL AND ROLLER BEARING HUB.

THE accompanying illustrations depict a combination ball and roller-bearing hub for the road wheels of motor-cars, which has just been introduced by Mr. J. R. Churchill, of 115A, Queen Victoria Street, E.C. The object of the arrangement is to obtain the advantages of roller bearings without the expense of employing two such bearings for each wheel. It will be seen that the device comprises

FIG. 1.—HUB FOR REAR AXLE.

a special hub and flange proper, together with only one set of rollers in a cage and one set of balls to work in suitable races. The rollers are so placed as to receive all the dead weight on the wheel (or as much of it as may be desired in any special case), the balls being placed to take none, or very little, of the dead load,

FIG. 2.—HUB FOR STEERING AXLE.

the function of the latter being to take the side stresses coming on the wheel when in actual use. By their joint action, the roller bearing and the ball bearing are claimed to keep the wheel in strict alignment with the axle. In the case of rear wheels for side chain drives, the roller bearing is placed so as to take, direct, the full pull of the chain on the sprocket as well as the dead weight on the wheel itself. The hubs are made for both front (steering) and rear axles in a variety of sizes.

THE Aero Club of the United Kingdom has ordered its first balloon.

On Saturday last, at Netherall Gardens, N.W., some trials were made of a new device intended to prevent the running back of motor-cars on steep grades. It consisted of a couple of large wooden wedges supported one behind each of the rear road wheels. In climbing hills these can be let down on the road behind the wheels. While it cannot be said that they add to the appearance of the car, the wedges appear to be capable of preventing all chance of the car running back in a hilly country. We may add that a very similar arrangement was shown on one of the cars at the exhibition in Paris, in January, 1901.

MOTOR-CYCLE TRIALS.

THE Motor-Cycle Trial organised by the Metropolitan District Association of the Cyclists' Touring Club and the Automobile Club of Great Britain and Ireland took place at the Crystal Palace on Saturday last. The meeting was open to motor-bicycles of any horse-power, and motor-tricycles not exceeding $2\frac{1}{2}$ h.p. The conditions were that the stewards of the Automobile Club would fill up petroleum spirit tanks completely, after which the machines were to be ridden 20 miles on the track. It was not a race, as no records of time were taken, but if the time taken in completing the 20 miles exceeded one hour the rider was disqualified. Pedalling after the motor-cycle crossed the starting line was not permitted, a stoppage of any kind on the track disqualifying the machine and rider.

On the completion of the 20 miles run the machines had to be ridden directly off the track without dismounting, and proceed up Rock Hill, turning at the top, descend, turn at the bottom, and repeat the ascent twice, making three ascents in all, and return without dismounting to the track enclosure. Pedalling was permitted when the motor-cycles left the track. The hill is 800 yards long, the steepest portion of which has a gradient of 1 in $6\frac{1}{2}$.

The afternoon was anything but a pleasant one, heavy showers falling at intervals and completely drenching the track. It was, therefore, not surprising that out of the 23 entries only fifteen put in an appearance. The operation of filling the petrol tanks on the different machines was put in hand at about the appointed hour, the riders being despatched on their journey, not together, but at somewhat irregular intervals. Of the fifteen machines which started, fourteen were motor-bicycles—representing thirteen different makers—the fifteenth being a Singer motor-tricycle. Although the 20 miles on the track was not to be a race, it was soon evident that a trial of speed was being indulged in by two of the competitors—H. Martin, on the $2\frac{1}{2}$ h.p. Excelsior, finding a rival in a 2 h.p. Mitchell, ridden by G. V. Rogers, an expert American motor-bicyclist, who reached this country only a week or so ago. As already mentioned, no records were taken of the time occupied by the different competitors in reeling off the 20 miles on the track, but we ascertained that Rogers on the Mitchell led the pace by doing it in 37 min. Of the fifteen competitors, ten succeeded in completing the 20 miles without pedalling or a stoppage of any kind, which, under the weather conditions, is very satisfactory; while, as will be seen below, the cause of the stoppages of the remaining five were not such as would be a serious matter on the road.

As a result of the starting of the competitors at irregular intervals, certain of the riders finished their 20 miles on the track a long time ahead of the others, so that machines were leaving and re-entering it for the second part of the programme while others were still careering around, and, as a result of the somewhat unsatisfactory arrangements at the gate, it was a wonder that no accident occurred. As it was, there were some very close shaves. The difficulty of the hill-climbing task was increased owing to the wet and soft condition of the roadway, particularly on the steepest grade, and it was a matter of some surprise that such a large proportion got through the task. Of the ten competitors left after the track trial seven succeeded in performing the hill-climb the stipulated number of times, the failure of the Mitchell, which did so well on the track, being due to the stretching of the driving belt.

As the competitors returned to the track, after the hill-climbing trial, the consumption of petrol was ascertained, under the direction of Mr. Worby Beaumont, the method adopted being to pour from a measured glass sufficient petrol to refill the tanks on the machines. No new types were seen amongst the competing machines, but we noticed a new departure on the Werner ridden by E. H. Arnott. In place of the small flat-belt pulley on the motor shaft, a small chain wheel was fixed, the power being conveyed to the ordinary belt pulley by a block chain of the usual bicycle type. There were no teeth on the rear pulley, the necessary grip or slip being obtained by a small sprocket mounted as an adjustable idler behind the motor. Mr. Arnott

informed us that while it is merely an experiment, so far as he has tried it the arrangement has given very satisfactory results. We append a table giving a *résumé* of the results of the trials, and, to save reference, may add that 20 fluid ounces are equal to a pint:—

Name of Competitor.	Machine.	Petrol Consumption.	Time occupied in making Ascent and Descent of hilly course in grounds.					
			First Attempt.	Second Attempt.	Third Attempt.	Fourth Attempt.	Fifth Attempt.	Sixth Attempt.
F. Birch ...	Singer 2½ h.p. Bicycle	31½	1 57½	1 56½	1 40½			
B. Yates ...	Humber 2 h.p. "	38	1 30½	1 31½	1 44			
T. B. André ...	Derby 1½ h.p. "	42	2 10	2 21½	2 50½			
E. Perks ...	Singer 2½ h.p. Tricycle	42	1 31½	2 46	1 38			
H. Martin ...	Excelsior 2½ h.p. Bicycle	44	2 28	1 41½	1 28			
A. T. Nixon ...	Hewetson 1½ h.p. "	50	2 19½	1 48½	1 52½			
E. H. Arnott ...	Werner 1½ h.p. "	110*	2 5½	1 56	1 58½			
C. R. Abbott ...	Stretton 2½ h.p. "	—	stopped on track owing to failure of sparking plug.					
W. Parry ...	Minerva 1½ h.p. "	—	2 17½	—	—			
J. C. Nixon †	U. M. I. 1½ h.p. "	—	1 52½	2 33½	1 49½			
E. Perman ...	Enfield 1½ h.p. "	—	3 1½	—	—			
G. V. Rogers ...	Mitchell 2 h.p. "	—	3 30½	—	—			
A. Westlake ...	Chapelle 2½ h.p. "	—	stopped on track owing to loose ignition wire.					
A. C. Wright ...	Ormonde 1½ h.p. "	—	driving belt broke on track.					
J. J. Leonard ...	Werner 1½ h.p. "	—	did not complete 20 miles on track owing to error.					

* Large consumption was due to petrol tank leaking at top.

† Consumption not taken because of stoppage on track owing to belt coming off pulley.

The best performance of the day, from the consumption point of view, as will be seen, was that of the Singer 2½-h.p. bicycle, its steadiness of running being much commented upon. The Humber 2-h.p. bicycle was a good second as regards consumption, and in the hill climbing came out with the best times, the Singer being second, the use of the pedals being not resorted to, we understand, by either machine during the whole of the trial.

At a recent fire at Bryn Mawr College, Bryn Mawr, Pa., U.S.A., the private motor-car of Mr. L. S. Clarke, president of the Autocar Company, Ardmore, Pa., rendered signal service in carrying coal from a neighbouring coal yard to the fire engines.

MESSRS. COXETER AND SONS, Limited, of Abingdon-on-Thames, will have a supply of petrol at their Oxford depot in Broad Street on the occasion of the Automobile Club's trial on the 3rd prox. Workmen will also be in attendance should any cars require repairs.

MR. A. E. EDWARDS, who was to have read a paper on Motor-Vehicles before the Birmingham Association of Mechanical Engineers on Saturday last, unfortunately met with a motor-car accident a few days before. The reading of the paper has been postponed until to-day (Saturday).

It is proposed to establish a small model village at Willingdon, near Eastbourne. Should the proposal become a reality, a rapid and inexpensive means of transit between the two places will be necessary, and already a motor-bus service is being advocated in view of the early completion of the King's Drive.

MESSRS. JOHN CHILD MEREDITH, Limited, of Birmingham, have sent us a sample of the "Bilar" sparking plug, which, apart from its small size, comprises several special features. No cement is used in its construction, and the porcelain is in two pieces to allow for expansion, the outer part taking the form of a bell-shaped piece. A rod passes down the centre, and is held in position by a lock nut, between which and the porcelain is fixed a small spiral spring. Thus, while the rod is securely held, provision is made for the expansion of the porcelain without it becoming crushed. We have not had an opportunity yet of testing the plug, but the arrangement strikes us as being a good one.

ENGINES AND BOILERS FOR LIGHT STEAM CARS.

DURING the past twelve months we have had many enquiries as to where engines and boilers could be obtained suitable for use on light steam cars similar to those used on the increasingly-popular vehicles of America in construction. Several firms are now going into this department among them being Messrs. F. Wilkinson and Company, of the

FIG. 1.

Beaver Steam Car Works, Cornbrook Road, Manchester, two of whose specialities we are this week able to illustrate.

Fig. 1 shows a two-cylinder steam engine developing 5 h.p.; the cylinders are 2½ in. diameter by 3½ in. stroke. The engine frame is made wholly of gun metal. The valves are set to

FIG. 2.

cut-off so as to use steam expansively. The main eccentrics run on ball bearings. The engine, which is of American construction, is equipped with boiler-feed and fuel pumps.

Fig. 2 shows a steel boiler of the type used on light steam cars. It is fitted with a large number of ½ in. copper tubes, and is made in a variety of sizes according to the steam-raising capacity desired.

THE BOLLÉE VARIABLE ADMISSION VALVE MECHANISM.

M LEON BOLLEE, whose novel three-wheel car will still be remembered by most motorists, has recently devised a new variable admission valve mechanism for petrol motors. The device, combined with the admission valve, A, of the motor, which is controlled by the spring, B, and has under normal conditions of running a maximum opening or lift, X, consists essentially of a lever, C, pivoted at D, the arm of the lever toward the valve stem terminating in a fork, F, embracing the prolongation of this stem by means of a sleeve, E. This sleeve is provided with a collar which abuts against the arms of the fork when the valve opens and leaves the latter a play equal to X. The opposite end of the lever, C, is placed under the action of a flat spring, H, tending to force it into the position of maximum valve opening. It is also connected by means of a rod, I, and a spring, J, to a bell crank lever, K, which in turn connects with a rod, L, leading to the operating device convenient to the operator. The lever, C, is also provided with a projection, M, abutting against N and thus limiting the motion of the lever, C, and the

maximum opening of the valve. As stated, when the motor is in normal operation the projection, M, of the lever, C, rests on N, and the valve has its maximum opening, X. When the operator desires to decrease the speed of the motor he exerts a tension on the rod, L, which through the interposed mechanism raises the forked end of the lever, C, and thus reduces the lift of the valve. By setting the operating device in the extreme position the arms of the forked end of lever, C, are caused to bear against the collar on sleeve, E. The suction has then to open the valve against the combined retarding forces of the valve spring and spring J, and the opening is consequently small. This latter position of the operating device permits, it is claimed, the motor to be run at a slow speed without load, and to avoid the noise of the exhaust, vibration, and heating under such conditions.

MESSRS. F. WILKINSON AND CO., of Cornbrook Road, Manchester, inform us that they are the sole agents for Great Britain of the Steamobile Company, whose steam-car was described in last week's *Journal*.

COMPETITION REGULATIONS.

SO far as the speed trials and races under the auspices of the Automobile Club are concerned, the following classifications and regulations have been officially adopted.

TOURIST VEHICLES.

The decision as to whether a vehicle is qualified to run as a tourist car or not is left with the Races Committee. Passengers on such cars must be accommodated with seats conveniently placed. The vehicles must be fitted with mud guards and carry such tools as are necessary when on tour. The classifications are as follows:—

Class.	Weight of car.	Passengers.
A	25 cwt. or more	4
B	between 20 and 25 cwt.	4
C	less than 20 cwt.	4
"	" " 18 "	3
"	" " 16 "	2
D	" " 15 "	4
"	" " 13½ "	3
"	" " 12 "	2
E	" " 10 "	4
"	" " 9 "	3
"	" " 8 "	2
F	motor-cycles	—

SPEED TRIALS AND RACES.

With regard to vehicles entered for speed trials and races the following classification has been adopted:—

Special Class.—Vehicles weighing 1,000 kilogs. (equals 19 cwt. 2 qrs. 20 lbs.), or more.

Class A.—Vehicles (carriages) weighing 650 kilogs. (= 12 cwt. 3 qrs. 5 lbs.), or more, but less than 1,000 kilogs.

Class B.—Light carriages weighing 400 kilogs., that is 7 cwt. 3 qrs. 14 lbs., or more, but less than 650 kilogs.

Class C.—Voiturettes weighing 250 kilogs., that is 4 cwt. 3 qrs. 20 lbs., or more, but less than 400 kilogs.

Class D.—Motor cycles weighing less than 250 kilogs. (4 cwt. 3 qrs. 20 lbs.).

Not less than two passengers are to be carried except in Classes C and D, in which only one need be carried. The passengers to weigh on an average not less than 70 kilogs. (154 lbs.), and the average weight to be made up by ballast.

In weighing vehicles, fuel, water, tools, and accessories need not be taken into account, the weight of a car being defined as "its weight with body and cushions."

Among details which have been agreed to by the Trials Organisation Committee of the Club are the following:—Spark-plugs and tyres may be changed during the time allowed for cleaning and repairing. The changing of sprockets is not to be permitted. If tremblers are changed, notice of the fact is to be given. On the entry forms owners of cars are to give the bore and stroke and number of cylinders. For hill-climbing performances the following formula has been adopted:—

$$\frac{\text{horse power} \times 10,000}{\text{price.}}$$

The horse-power is that shown by performance on the hills, and the price is that at which the car is entered. In speed trials the marks are to be allotted by a formula of speed in miles per hour multiplied by ten.

MESSRS. ROBERTSON, LESLIE, FERGUSON AND COMPANY, of Waterford, Ireland, are adopting a motor delivery van.

It having been reported that the Clipper Pneumatic Tyre Company's arrangements with Messrs. Michelin and Co. for the supply of Clipper-Michelin tyres had terminated, we are able to announce that such is not the case. The company is in a position to supply Clipper-Michelin tyres in all the current standard sizes, and will continue to do so as heretofore.

HERE AND THERE.

OUR illustration depicts the touring steam car, one of the latest productions of the Locomobile Company of America. The vehicle has a long wheel base with seating capacity for four persons. In addition to possessing all the features of the latest types of steam cars, provision has been made in the way of extra fuel and water capacity to enable it to be employed for long

MR. W. M. LETTS ON THE NEW LOCOMOBILE TOURING CAR.

runs. The water tank has a capacity of no less than forty-two gallons, while that of the fuel tank is twenty-four gallons.

On Tuesday, the 22nd, the third day of the Automobile Club's exhibition at the Agricultural Hall, a sale of motor-vehicles belonging to members of the Club will be held at Mr. Harrington Moore's City garage.

So many unfounded rumours have been circulated with regard to M. Santos Dumont's plans that little credence is now given to anything appearing in the press about the famous aeronaut. We are able to state, however, on reliable authority that he will make ascents in his air-ship from the Crystal Palace during the month of June.

THE Caledonian Motor-Car and Cycle Company, Limited, of Aberdeen, will in the course of a week or so remove its repairing depot to its new premises, the Caledonia Motor and Cycle Works, Rosebank Terrace, Ferryhill. The offices and showrooms of the company are also being removed to 339A, Union Street, five doors west of the present premises. The company has been appointed official repairer in Aberdeen and district to the Automobile Club.

THE Albion Motor-Car Company, of Glasgow, which is being converted into a limited liability company, and is building larger works to cope with the demand for its cars, has issued a new catalogue, from which we learn that Sir T. D. Gibson Carmichael and Mr. John Wilson, M.P., are owners of Albion cars. The catalogue is well got up, and gives illustrations of the company's sporting dogcart, tonneau car, and doctor's car, as well as a useful lengthy specification of the vehicles.

NATURALLY, the first edition of a directory cannot be expected to be wholly free from errors, and in the first edition of Porter's Directory of the Motor Trades of Great Britain and Ireland several slips occur which will find correction in the next issue. Particulars as to the Automobile Club committee, etc., might have been obtained later than October, 1901, and the names of the firms should have been read with greater care. Still, to use a hackneyed term, the Directory supplies a want, and will find a place on the office bookshelves of most motor-car firms throughout the country. It is published at 44, Castle Street, Liverpool.

THE London Motor Garage Company, Limited, has been registered with a capital of £20,000.

THE *Field* suggests that the representative organisation of automobilists should give serious attention to the provision of bath-rooms in hotels. Why not a committee on the subject?

IN order to increase the productive capacity of their works to eight Argyll cars per week, the Hozier Engineering Company, Limited, is increasing its plant.

THE action brought by the Automobile Association against Mr. Twigg for the alleged wrongful detention of a motor-car has been settled, a compromise having been arrived at.

AT the Shoreham Petty Sessions on Monday, A. F. Mortimer was fined £3 and 23s. costs for driving a motor-car at an improper speed.

THE Automobile Components, Limited, has been registered to carry on the business of manufacturers of and dealers in cycles, motor-cars, etc.

THE Sunlight Motor and Cycle Company, Limited, has been registered with a capital of £1,000, to carry on business in cycles, motor-cars, etc. The registered office is at 30, Paradise Street, Coventry.

MESSRS. STROUD BROS., nurserymen, 182, Green Lanes, Finsbury Park, N., are arranging to have a selection of palms, ferns, etc., for the decoration of stands at the forthcoming Exhibition at the Agricultural Hall, and exhibitors are invited to communicate with them as early as possible.

WITH regard to the Rochet-Schneider light car described in our issue of March 29th, the F.M.I. Syndicate, of 67, Chancery Lane, London, W.C., who have been appointed British agents for the Rochet-Schneider Co., of Lyons, inform us that several improvements have been introduced in the 1902 models. The new type differs from the old one in that the motor is governed on the throttle and not on the exhaust, and that the coil radiator is superseded by a tubular ventilating tank through which air is drawn by a fan *a la* "Mercedes."

OUR illustration gives a general view of the new steam car which is being introduced into this country by the Miesse Steam Motor Syndicate, Ltd. The boiler, which is of the flash type, is placed under a bonnet forward of the dashboard. The burner, which consumes ordinary paraffin, is contained within an asbestos-lagged metal case enclosing the boiler tubes: it consists of two tubes about 2½ in. in diameter, joined together at right angles, and lying along two sides of the fire box. The engine is of the three-cylinder single-acting horizontal type, carried beneath

THE MIESSE STEAM CAR.

the footboard, having its mushroom inlet valves above, and its exhaust valves below the cylinders. The water pump is fitted with an automatic by-pass. A tier of condensers is set in front of the car, and a horizontal nest of plain tubes is carried beneath the floor of the car. We hope to publish a full description of the new car in an early issue.

CORRESPONDENCE.

A SIMPLE AIR PUMP FOR STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am just back from a sea voyage, and find in your issue of March 1st plans, etc., of the Westinghouse air pump, adapted to light steam vehicles by the Overman Company. These pumps are steam thieves. I designed and built one on my own lines two years ago, when motoring first took the States by storm. It was in use but a few months when I started to make the engine do the work at a very economical cost—so low a cost, in fact, that when running there is positively no appreciable difference in speed whether the pump be working or not, even on stiff grades. Therefore I send a sketch of the pump I am now using, the result of two years' experience. It is just a plain, matter-of-fact contrivance, that is always ready when wanted, with nothing to get out of order but the valve, which is no item nowadays. It is inexpensive to make (I prefer brass), and no doubt many men could make most of it themselves. I have a bit of a shop as a plaything, and do all the work without any trouble, wrist-pin and all. I regret I have no memorandums with me, so have had to guess at the few dimensions risked. These, however, would resolve themselves to a practical man, as they did to me.

The pump is similar to a bicycle hand pump, the bore being about $\frac{1}{2}$ in. The washer must be of heavier leather, however, and the edge pared experimentally to give suction as well as discharge before mounting. I have found it well to drill a few holes just below the cup at the end of the up stroke to ensure the full capacity of air. The frame of common band iron is bolted to the cross braces usual to this type of car as in use to-day. Material of, say, 1-16th by 1 inch should be used. A special wrist-pin must be made (chilled, not case-hardened), as seen in sketch. The pin, or finger, giving motion to the pump can be worked out from the head if nut is desired inside of engine frame. From this wrist-pin finger a link carries motion to the pump lever, its idle end being made fast to the brace carrying the floor board. The full stroke of the piston should by no means be used, as the valve cannot stand the rush of air at high speed. About two inches from the outer, or motion end of lever, a cotter is inserted. On the lever is a sliding shoe coupled direct to the pump. When the shoe is against the cotter-pin, the stroke is shortened and the pump in a much more convenient position than along the centre line of motion of the engine. The shoe should be held in position by taking a turn through or round this cotter-pin with a bit of wire. To throw out of gear push

the shoe to the idle end of the lever and fasten in any way desired. This means getting out of the car; but after two years' experimenting with different pump gears and lever control, this is as satisfactory a way as I have found—not that the others did not work, but because they would get out of order. The space is too confined. To be sure, the pump in my case is used but once a day, my car being fitted with large storage air tanks on the back of the vehicle (in place of usual type tank) under high pressure, with independent gauge, from which the fuel reservoirs are charged with air. For the air-discharge valve a type in common use in the bicycle trade may be used; when worn out it can then be replaced anywhere.

After the pump is set up on the frame and coupled up the engine should be brought to the limit of the outward stroke; the pump should then be shored up with washers, as shown, to a squeezing fit, to make sure of getting all the air possible on each stroke. It is a slow pump, and one must not be greedy for air. If the valves deteriorate too rapidly, shorten the stroke by moving cotter-pin on the lever back, and shore up the pump again. Leave the pump barrel extra long on account of the out-of-gear position. Run a line of small brass tubing from any place on the air pipe to very near the pump, and couple with rubber. On this pump line of pipe put a pin valve, which must be closed tight when pump is out to hold pressure.

The pump lever should be horizontal at mid-stroke of piston, but this goes without saying. However, the idle end of lever might come on this pump frame instead of the floor brace, this depending on how the engine is hung.—Yours truly,

WM. H. BRADFORD.

COST OF MAINTENANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been very much interested in the correspondence "Cost of Maintenance." There has been no letter from a steam car owner, so I have pleasure in sending a summary of my expenditure:—

Two tyres (single tube), six bands, repairs, £15. Petrol, £10 10s. Lubricating oil, £1. Repairing burner, 40s. New spokes, 10s. Various small parts, including new chain, 30s. License, 42s. Total, £32 12s. In addition I have had fitted the following extras:—Emergency brake and sprag. Inberthy injector, lamp, spare "torch," lubricators for slides, etc.; total £17 8s.

The car has run in nine months about 3,000 miles, 2,500 miles being entirely in my professional work as a physician, the remainder in touring. I find the consumption of petrol in touring is about half that required in my professional work, e.g., I have frequently travelled 45 to 50 miles, and once 52 miles, on a tank of petrol ($3\frac{1}{2}$ gallons) when touring—usually 25 to 30 miles at home. Excepting a new composition washer in the auxiliary throttle-valve and two new cones in the engine crank bearing, the engine has had no repairs whatever. The boiler has never required any repairs, and my car has never been towed home.

The chief objection to a steam car is the tremendous exhaust on hills and on the level in cold weather, and I am anxious to hear of a satisfactory condenser. The steam car is satisfactory in ease of starting and stopping, absence of noise and vibration, facility of change of speed, and is comparatively easily understood by an amateur. Finally, it can be repaired by engineers where, as I am, there are no skilled motor repairers. I have had no collisions or accidents, and my expenses are what I consider a steam car may cost with the most careful driving.—Yours sincerely,

M. B.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been much interested in the correspondence on this subject, and take the liberty of adding my own experience. My car, which is an English one, belt-driven, and of $3\frac{1}{2}$ h.p., was new last April, and up to December 31st last had been driven 2,800 miles. The following has been the total cost:—

	Per mile.
Repairs and renewals	£20 16 8 = 1.7857d.
Sundry expenses, including fares to works, licence, etc.	12 5 11 = 1.0539d.
Extras, such as driving-gloves, overalls, aprons, luggage-case	7 19 11 = .6817d.
Petrol and lubricating oil	12 15 5 = 1.0946d.
Repairs to tyres	9 19 8 = .8557d.
Depreciation	50 0 0 = 4.2857d.

It will thus be seen that total cost without depreciation has been approximately 54d. per mile, and with depreciation 93d. per mile.

I have done all possible repairs myself, and always drive myself. Furthermore, I have had the advantage of being able to "house" rent free. Now, I consider above to work out far in excess of what a small motor-car should cost. Of course, when I bought the car I was told that the cost of running would be about 1d. per mile. To include rent and wages will bring it nearer 1s. 6d. per mile.

Pneumatic tyres are also a fearful nuisance, and require money being spent on them continually.

The expense of keeping the motor-car has so drained my limited resources that it will be impossible for me to again invest in one for some time; but it will not deter me from trying my luck again later on, for there is nothing, in my opinion, so fascinating and exhilarating as motor driving.—Yours truly,

NIL DESPESANDUM.

THE ACCELERATOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In heavy touring and racing cars of the petrol type, a device is frequently provided by means of which the driver of the vehicle may act on the governor, either entirely interrupting its action or shifting it to a higher speed. The idea or object of this device is to permit occasional bursts of vehicle speed in connection with a normal safe motor speed insured by the governor. A device of this kind is evidently a valuable adjunct in racing vehicles, for the motors of such vehicles are always designed so as to run at very high speeds when ungoverned, a governor being necessary to prevent dangerous speeds when the motor is momentarily running free, etc. But when the vehicle is once on its way in a contest the driver wants the highest speed attainable, practically without regard to the resulting wear and tear on the motor, and the governor must therefore be cut out.

The larger vehicles built in France are chiefly designed with a view to their use in races, and hence the provision of the accelerator is explicable. In this country the conditions are quite different. The question therefore arises in my mind, Is there any need or justification of the accelerator under such conditions? This question must be decided upon two counts—first, the convenience and practical value of such a device to the user, and, second, the effect of its use upon the life of the motor and other parts and the disadvantage of the added complication.

With the higher-powered cars now on the market there are few, if any, of the class in which accelerators are provided that cannot attain a speed "well up to the legal limit" with the motors under governor control. Both efficiency and durability are sacrificed by speeding up the motor, and from the standpoint of minimum cost per unit of distance travelled the use of the accelerator is, to my mind, certainly inadvisable. All points considered, I am led to the opinion that the practical usefulness of the accelerator is somewhat problematical. The opinions of some of our experts on the question would no doubt be of general interest.—Yours truly,

ANTI-ACCELERATOR.

EXHAUST BOXES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have often been troubled with the shunt pipe from the exhaust box to carburettor (Longuemare) breaking. The other day it broke, and I disconnected it from exhaust box (closing up the hole in same), and put the broken end of the shunt pipe near the exhaust box: it had broken off at the exhaust box end. The carburettor seemed to work just as well. It would be interesting to know if others have experienced this, as it seems unnecessary to have this shunt on to the exhaust box, as the carburettor appears to get sufficient heat if the end of the pipe lies near the exhaust box or pipe.—Yours truly,

AMATEUR.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with some surprise in the *Journal* of the 5th inst. a letter from Mr. Helmore, secretary of the Automobile Mutual Protection Association stating that no member of the trade had ever been refused membership of the Association after applying for same. This is not correct. A few months ago I applied to be elected, and had an interview with Mr. Helmore, when, on that gentleman's suggestion, I paid him two years' subscription. Later this money was returned to me, and Mr. Helmore led me to suppose that the Committee refused to elect me, as some of its members had an idea that my views were not in harmony with theirs.—Yours truly,

G. H. SMITH,

Manager of the United Motor Industries, Limited.

MR. S. F. EDGE also writes adhering to the statement he made at the meeting on March 20th, and adding, "I personally know a member of the trade who was refused admission."

THE EXHIBITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if any of your readers could advise me as to which would be the best day to go to the Motor-Car Exhibition, which is to be held at the Agricultural Hall from the 19th to the 26th of this month. Are there going to be any special features on any one day, or are the events of each day going to be alike?—Yours sincerely,

O. K.

[In reply to our correspondent, who writes from a distance from London, we would say that, so far as the cars are concerned, the proceedings on each day will be of equal interest. Similar arrangements will be made on each of the shilling days, so that there will not really be anything to choose between them. Wednesday, the 23rd, will be a half-crown day.—Ed. M.C. J.]

HOW TO SELECT A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with interest your article "How to Select a Motor-Car," and as I am one of those who are anxious to buy a car, I shall be glad of a little further advice. I notice you say the motor is the most important part of the whole thing, and ought to be carefully examined, but what is the good of a novice examining a motor when he knows absolutely nothing about it? I am one of four in this neighbourhood (Devon) who have given up horses with the idea of purchasing cars, but who are met with doubts and difficulties on all sides. I myself have found the greatest difficulty in getting anyone connected with the trade to give me information about a car. Indeed, when last year in London I asked a well-known firm to give me a modest ten mile trial trip. They refused. Consequently I left without purchasing, being told no one in London would do such a thing. The question is, then, what are we to do? We have no experience, and apparently we are not going to have any until we decide to purchase and take everything that is told us as being correct.

The first question is, which is the most suitable car to meet my requirements? I live in South Devon, where hills are steep, long, and badly kept, gradients often one in six. I want a car to take the place of a good useful horse; that is to say, a car that I can run about town in, take a turn in the country (always hilly), or go on tour for a few weeks two or three times a year. I do not want to go flying about at twenty-five or forty miles an hour, or to run a hundred miles a day, but would be content with forty at most. As Mr. Estcourt remarked last week in the *Journal*, I want a car with as few complications as possible and thoroughly reliable, one that will take the hills without shedding its load, and with brake power that will stop and hold the car at all times. I think I have stated my wants fully. I may say that I am limited to about £250.

PERPLEXED.

THE CARE OF ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your article on "The Care of Roads," I think that it is just as important that something should be done to improve the by-lanes as well as the main roads. In the district of Harpenden, Herts, there are many lanes ruined by laying down large flints, where the traffic is so small that they never get ground down. Does the Automobile Club ever take action for getting gradients eased? There is a very bad hill between Redbourne and Harpenden, which a motor-tricycle can hardly surmount, and it is necessary to go a long way round north of Redbourne and Harpenden when I am coming home again. When is the Bill removing the speed limit expected to be read a first time? I hope that the motor-cycle tax will also be abolished by it. Why is this tax so little complained of?—Yours truly,

Cecil Jackson.

A BUSINESS MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—During the last six months I have been doing a great deal of my outdoor work on different motor-cars, and I send you my views as to what a really useful small car should be for the ordinary business man. The car would, of course, be quite useless for racing purposes.

Car to seat three or four.—Two facing front, inclined wheel steering, engine under bonnet; tubular frame, with four equal-sized, rather small wheels under long springs; artillery wheels, with large solid tyres; each wheel easily detachable, so that a spare wheel with chain wheel on it could be kept or even carried when going far from home. Body of varnished wood, with back and seat cushions to strap on, so that they could be cleaned and dried easily. Engine 4½ h.p., petrol, with one cylinder with plenty of water round it; cylinder fitted with two sparking plugs, so that the whole electrical apparatus could be in duplicate, with two cams and tremblers, and arranged so that either plug could be switched on, or both. The gearing extra heavy, sprocket wheels larger than usual, so as to reduce strain and friction on chains; every part standardised; nearly every part fixed with nuts and lock nuts, with ample spanner room, and only three sizes of nuts used. Such a little car, geared to be slow on the level and quick on the hills, with its duplicated sparking, solid tyres, and spare wheel, would be much more reliable and really useful than most, and I think could be sold at a good profit for £100, if every part were machine made and turned out by hundreds.—Yours truly,

ROAD SURVEYOR.

PROF. F. B. HUTTON, of Columbia University, New York, recently lectured before the Automobile Club of America on "Some Underlying Principles of Automobile Design," and after the lecture intimated that a highly revolutionary petrol engine was at present being tested in the Columbia laboratories, which gave promise of flexibility of power equal to that of a steam engine.

THE EXHIBITION.

On Saturday, April 19, the Automobile Club's exhibition at the Agricultural Hall, Islington, will open under the direction of Mr. Charles Cordingley, who organised the first motor-car show at the Agricultural Hall in 1896, and who has promoted every successful British exhibition of the kind since that date.

The exhibition will be open all day, and, as everyone knows, the Hall is accessible from all parts of the Metropolis. Admission will be one shilling on each day except Wednesday, the 23rd, when the charge will be half-a-crown, that day being known as Club day. The public will, however, be admitted.

Next week we shall give an outline of the leading features of the display, and the following issues of the *Journal* will contain a full and complete report of the Exhibition. Those who are unable to visit the Exhibition will therefore find our columns during the next few weeks of permanent interest.

The selection of British-made cars on view will illustrate the progress that has been made in the industry since the last Exhibition, while from the countries of the Continent and from the United States will come a varied and comprehensive display of cars of every type. For the purposes of the Exhibition an attractive poster has been prepared, only a few copies of which now remain. These we shall be pleased to send to any motor-car agent, applying by an early post or by telephone, who is willing to exhibit the same.

So far as the exhibitors are concerned, they are making every effort to ensure that the Exhibition shall be ready on the opening day—a point of value to them judging from the prominence which the Press is certain to give this year's Exhibition.

ALLEGED THEFT OF A MOTOR-CAR.

ADOLPH OTTO, of Ashurst, Levington Road, Anerley, has been charged at the Greenwich Police-court with stealing a bicycle. At the conclusion of the hearing Detective-inspector Fox asked for a remand, as a further charge would be preferred against prisoner concerning a motor-car. This was granted. On Tuesday the prisoner pleaded guilty to stealing a motor-car valued at £200. He obtained the vehicle from a Cambridge firm in April of last year on the hire system, paying £20 down, and agreeing to pay £12 a month afterwards. No further instalments, however, were paid, and the car was found to have been pawned for £25, the prisoner producing a false receipt. Otto was sentenced to three months' imprisonment.

ALLEGED OBSTRUCTION.

CHARLES GILES was summoned before the Hastings Borough Bench for having allowed a motor-car to stand longer than necessary on March 26th in Robertson Street. Defendant pleaded guilty. The Chief Constable stated that the Bexhill Motor-Car Company, for whom defendant was a driver, were running motor-cars. They were not entitled to go on the stage carriage stand. Defendant was fined 2s. 6d. and costs.

FURIOUS DRIVING CASES.

PETER McCALL, 26, Ebrington Street, Plymouth, pleaded not guilty at the Plymouth Police Court to driving a motor-car at a greater rate than twelve miles an hour on December 14th, 1901. The case had been frequently adjourned, the charge had been amended, and the defendant was allowed costs for previous amendment, together with one guinea in addition. Mr. Percy T. Pearce appeared for the defence. The Chief Constable (Mr. Sowerby) and several constables having given evidence, Mr. Pearce, in defence, pointed out that the motor-car might travel at twelve miles an hour, while the borough trams might not do more than eight miles. Therefore the mere fact that it had passed the tram had no weight as evidence. He complained that the police had not acted as fairly as usual in not stopping the man at once, so that he could call the passengers as witnesses. A motor-car could be stopped within four yards when at its fastest speed, yet the Chief Constable did not try to stop it as it passed. He selected a piece of road on a slope where the driver was liable to go a little faster than usual. Walter Turner Smith, manager and engineer of the Plymouth Motor-Car Company, said he had been connected with these cars in Lincolnshire for a period of nine months before. The highest speed possible was twelve miles an hour, since the engine was governed to 720 revolutions a minute. At any higher speed the car would be driving the engine, and not the engine the car. A car had to be driven down Friary Hill, since the gradient was too slight for it to run free. On being questioned by the Chief Constable, he said it was possible that the car might travel faster than twelve miles an hour if the engine were disconnected. He was an expert driver, but he could not drive it down Friary Hill at the speed of fourteen-and-a-half miles, which the Chief Constable had stated. Mr. Frank Barton, a member of the Motor-Car Company, said the car had been a bad one ever since it had been in use. He corroborated the previous expert evidence. The Bench said much of the evidence called in defence was theoretical, and in consideration of the police evidence ordered the defendant to pay £2 and costs or fourteen days' imprisonment. A second charge stood against the same defendant, but the Chief Constable said he did not press for punishment; he only required drivers to moderate

their speeds. He would like to withdraw the case, and permission was granted.

SIDNEY KNEEBONE, 36, Wyndham-square, Plymouth, motor-car driver, has been summoned at Plymouth for driving at a speed dangerous to the public in George-street, on February 12th. The Bench sentenced defendant to pay £2 and costs, or go to prison for fourteen days.

ROBERT M'GILLEN, 41, motor-car driver, 1, Thistle Place, Edinburgh, has been charged at Edinburgh with driving a motor-car in a reckless and careless manner in Coates Place, on the 20th ult., in consequence of which the car collided with a cable car going in the opposite direction. The accused, who had been previously convicted of a similar offence, pleaded guilty, and pathetically added that he had "given up motor-car driving now." The Sheriff said the fact that the accused had already been fined £3 for a similar offence debarred him from imposing a less penalty, and he would repeat that sentence, the option being ten days' imprisonment.

At Yarmouth Police-court, on Saturday, Thomas Self, of Marine Parade, was summoned for furiously riding a motor-bicycle. The case was dismissed on payment of costs.

CHARLES RICHARDS, of Dunkley Street, Wolverhampton, was charged at the local police-court with driving a motor-car at an unreasonable rate in Lichfield Street on March 27th. Police-constable Finney stated that the car was going at about fifteen miles an hour, and Police-constable Parsons put the speed down at which the vehicle was travelling at from sixteen to seventeen miles an hour. Defendant was fined 20s. and the costs.

FRED FLANDERS, a motor cycle manufacturer, has been summoned at Yarmouth for furious riding, and it was stated that he had a trailer car attached to his machine. The defence was that the speed did not exceed the twelve-mile limit, but the clerk ruled that, under the Light Locomotives Act, a self-propelled machine could not draw another vehicle through a town at a greater speed than six miles an hour. The defendant said that a motor-cycle could not be driven at this speed, and could be stopped in a very short distance. The Bench held that the pace was to the danger of the public, and inflicted a fine of 10s. and costs, with a reminder that he was liable to a £10 penalty.

At the Steyning Petty Sessions, Edward Manville, of London, was summoned for driving a light locomotive at an improper speed, at Lancing, on March 15th. This was an adjourned case, and Mr. J. H. Mitchell (Worthing), who appeared for defendant, asked for another adjournment, as the witnesses were not in England at present. P.C. Grinstead said defendant was driving a motor car along the lower road at the rate of at least twenty-five miles an hour. Mr. Mitchell proposed to postpone his cross examination until he could obtain his witnesses. The Chairman, however, decided that the case should be proceeded with. It was a matter which affected the safety of the public, he said, and they could not hold over the case for ever. A fine of £4 and £1 8s. costs was imposed. Mr. Mitchell asked to be allowed to communicate the result to his client ere paying the money. In reply to the magistrates, he intimated that he could not promise payment without seeing his client. He was sure the money would be all right, however. Eventually, time for payment was allowed.

WALTER L. CREYKE, of Abingdon, whose case had been repeatedly adjourned, has been summoned at Lewes Court for driving a motor-car furiously at Rottingdean on January 23rd. Sergeant Seal, in proving the case, said that the defendant's motor-car was going at a speed equal to 26 miles 3 furlongs 68 yards an hour. Mr. J. J. Lines estimated defendant's speed at about 20 miles an hour. Mr. H. J. Vinal represented the defendant, who did not appear, and pointed out that the defendant had pulled up when spoken to by the policeman. Superintendent Stevens mentioned that he had had complaints regarding the defendant from other parts of the county, and asked for a substantial penalty. Defendant was fined £7 10s.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, APRIL 19, 1902.

[No. 163.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Board of Trade returns for March have just been issued, and we hasten to publish the figures relating to the imports and exports of motor-cars and cycles. To deal first with the exports of automobiles of home manufacture, the shipments during the past month amounted to only fifteen vehicles, of a value of £4,478. Of parts, the exports attained a value of £1,098, making a combined total for March of £5,576, as compared with £6,569 in February last. As regards the imports of foreign cars and cycles, these of course show larger figures. In all, 255 cars and cycles were imported into this country last month, the value of the same being returned at £60,873. The value of the "parts thereof" is given as £9,640, so that we get a combined total of £70,513, as compared with £52,682 in February last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised nine vehicles, amounting in value to £2,493, and £429 of parts, bringing down the net imports in March to £67,591. During the first three months of the current year imports of foreign automobiles in Great Britain have reached a total of, roundly, £157,000, while the exports of British-built cars and parts during the same period have amounted to £23,137.

An Earl's Busy Day.

THE Earl of Shrewsbury and Talbot is not only a lover of horses, but also a motorist who regards the sport with enthusiasm. Last year he made several long runs on his 12-h.p. Panhard, notably one from London to York in a day, reaching Berwick-on-Tweed on the following day. As demonstrating what facilities for enjoyment are obtainable by means of the automobile, we may mention that on Thursday of last week his lordship set off from home before noon on his Panhard and had a non-stop run to Rugby—about sixty miles. After lunching and participating in a good afternoon's polo, he left shortly after five for London, arriving there—a distance of between eighty and ninety miles—in good time. Unfortunately a punctured tyre necessitated a short stoppage, but seeing that the tyre had journeyed about 2,000 miles without having before punctured, the Earl of Shrewsbury must be congratulated on combining sport and recreation at such distant places within a few hours.

In Parliament.

MOTOR-CARS and the speed with which they are driven formed the subject of a little conversation in the House of Commons on Monday. In reply to Captain Donelan, Mr. Ritchie said that the Local Government Board was the authority to regulate the speed of motor-cars in London. The maximum speed permitted was twelve miles an hour or such greater pace as was reasonable and proper, having regard to the safety of

human life. Captain Donelan asked, amid a chorus of "Hear, hear," "Are drivers of motor-cars registered or licensed, or do they require to pass any test of efficiency?" Mr. Ritchie replied that they were not—an answer which brought forward Mr. Cathcart Wason to ask that some means should be afforded the police to enable them to identify motor-cars. Mr. Flynn wanted to know "Is it not a fact that motor-cars frequently go over twenty miles an hour?"—a question that concluded the chat.

Lecture at Birmingham.

BEFORE the members of the Birmingham Association of Mechanical Engineers, Mr. E. A. Edwards read an interesting paper on Saturday last on "Mechanical Road Traction," and we regret that pressure on our space does not allow us to give a summary of the useful points emphasized by Mr. Edwards. On the table he had placed several parts of motor-vehicles, which were subsequently critically examined by his fellow members of the Association. These included a Clarkson radiator, a Simms-Bosch magneto machine, a Locomobile boiler, Wolseley engine, Clipper and Collier tyres, Century carburettor, Singer motor-cycle, and a Renold chain.

An Object Lesson.

AN object lesson to British motorists is being given by Mr. Alfred Harmsworth, who has purchased the 40-h.p. Mercedes car which ran third in the recent La Turbie Hill Climbing contest, and which was second in the mile contest at Nice on Sunday, being beaten only by one-fifth second by a car of similar make and horse power. Mr. Harmsworth has purchased the vehicle with the view of using it on the Continent; but, in order that English automobilists may have a chance of examining it in London, it will be exhibited at the Agricultural Hall next week. Although the motor gives 40-h.p., the car weighs only slightly over 19 cwt. It will probably be run on Whit Monday on the track at Bexhill which is now being specially constructed by Lord de la Warr.

The Exhibition Catalogue.

COMPREHENSIVE and nearly exhaustive of the firms engaged in the automobile industry in this country, the catalogue of the Exhibition has a permanent value beyond the average worth of such publications. Of course visitors to the great show will secure their copies at the Agricultural Hall; but there are hundreds of motorists in all parts of England who would like to possess a copy of the work. It is published at 6d., and will be sent for 9d. post free from the office of the *Journal* provided early applications are made.

Portsmouth Automobilists' Opening Run.

THE Portsmouth Automobile Club has been making rapid progress since its inauguration a few weeks ago, and already the committee can boast of over forty members, whilst a number of other gentlemen who are negotiating the purchase of cars have promised to join their ranks upon the completion of their orders. Amongst the former is Earl Russell, who has consented to accept the vice-presidency of the Club. On

D

Saturday last the members had their opening run, and a fairly good muster of cars of all descriptions left the headquarters—the historic old George Hotel, Portsmouth—for a cruise round the country. The first stop was made at Chichester, where high tea was served at the Dolphin Hotel, and after a stroll round the city the journey was continued through Midhurst and Petersfield, returning home, after a most enjoyable afternoon, about 10.30. On the outward journey a little friendly rivalry prevailed amongst the motorists for the honour of being the first arrival at Chichester, a position which was easily secured by Mr. J. Shervell's powerful car, Major Dawson arriving second in his 5½-h.p. Wolsley, and Mr. G. H. Cox's 6-h.p. M.M.C.'s car being third. Earl Russell had promised to be present, but was unfortunately prevented by a serious attack of ignition troubles and running out of accumulators.

The French Record.

As we went to press last week, news came that the Hon. C. S. Rolls had beaten the French automobile record for the kilometre, and we were able to briefly announce that he attained a speed of sixty-five miles an hour on a 28-h.p. Mors car. We may now add that the record was made without any preparation to the car. It had only been run once since the Paris-Berlin race, and the valves had not even been ground. The road at Achères was so bumpy that Mr. Rolls was only on his seat at intervals, while the approach was uphill and on a curve. Had it not been for the patches of stones on the road an even better speed might have been attained. In fact, since the foregoing was written Mr. Rolls has not only again beaten the French record, but has knocked another two-fifths of a second off his own.

OFF TO THE SHOW.

The Badminton Volume.

THE Badminton volume on Motoring has been published this week by Longmans, Green, and Co., and will be on sale at the *Motor-Car Journal* Stand in the Exhibition. This book has been made so well known that many motorists will doubtless take advantage of the opportunity to obtain copies at the Exhibition. Its contributors are all experts in the motor world, and it will certainly find a place on the bookshelves of many owners of motor-vehicles.

On the Riviera.

THE Riviera has been in the throes of what the correspondent of the *Pall Mall Gazette* calls a plague of automobiles. "For some days cars have been constantly arriving, until the streets teem with them. A fit of 'motor-mania' seems to have seized on the Niçois, and on every side nothing else but automobile gossip is heard. If perchance you go into a café you will be surprised to find the staidest villager earnestly discussing the merits of a Panhard-Levassor or extolling the prowess of the local champion. The

Concours d'Élégance at Monte Carlo was a great success. About fifty cars were entered, and they circulated round the grounds for over an hour. M. Jouran's triple phaeton was greatly admired, as were also the petrol-electric cars. Last week the cars were on exhibition in the Boulevard Gambetta, where crowds of people flocked to see them. The Automobile Flower Fête, which was held in the Jardins Publics, was very pretty. There were several very daintily decorated cars, the handsomest being Mr. Reiss' voiturette, which carried in front of it a lyre worked in marguerites and cornflowers. The body of the car was one mass of marguerites."

Another Use for Automobiles.

SOCIETY has so long taken to the motor-car as a means of pleasure that its extension to become a means of safety will be regarded as somewhat of a novelty in many quarters. Last week the Duchess of Sutherland was thrown from a horse while hunting with the North Staffordshire Hounds, and sprained her foot. It was then that she had recourse to a motor-car, in order to get to her residence at Lillieshall. An even more exciting adventure befell the King of the Belgians, himself an ardent motorist, when he was the other evening met at the railway station, on his return from France, by a crowd of excited subjects, who cheered for visionary ideas as well as for himself; but thanks to a motor-car which had been sent to await his arrival, he was able to avoid the more demonstrative section of his people. This is a new aspect of automobilism, which should commend itself to other crowned heads, and in fact to some which are not crowned as well.

The Nottingham Automobile Club.

THE opening run of the Nottingham and District Automobile Club for the season took place on Thursday last week, the destination being Newark. The members left Nottingham soon after two o'clock, and by 4.30 the spacious yard of the Ram Hotel, Newark, was full to overflowing with practically every type of the modern motor-car. The company sitting down for tea included Mr. R. Millington Knowles, J.P., president of the Club; Messrs. G. H. Kirk, G. Cowen (vice-presidents), M. Ross Browne, R. Harbidge, T. Sharp, B. W. Winter, H. Rimington, A. R. Atkey (hon. secretary), B. Blackburn, J. Burton, F. E. Burton, W. J. Dexter, A. F. Houfton, Dr. Houfton, C. L. Schwind, F. J. Smith, R. M. Wright, C. H. Guest, J. G. Stafford, W. Hugh Warburton, and C. S. Hardy. In addition, the company included a large number of ladies and visitors. Considerable interest was manifested on all hands at the very fine display of cars, and the marked advance which had taken place in the carriages owned by members of the Club since the opening run of 1901 was a matter of general surprise and comment. The return journey was commenced about six o'clock, after a most enjoyable gathering.

Incidents at the Exhibition.

MANY little incidents of general interest always occur at such an Exhibition as that now in progress, which, although worthy of publication, often escape notice. Attendants at the stands, as well as visitors to the display, are invited to favour us with short accounts of any interesting experiences which may occur to them during the week at the Agricultural Hall.

To Advertisers.

IN consequence of the pressure of the Exhibition and other matters, it will be necessary to have all displayed advertisements for the issue of the 26th inst. to hand at the offices, 39-40, Shoe Lane, E.C., not later than the afternoon of Tuesday next, the 22nd inst. Small advertisements cannot be inserted if received after the first post on Wednesday, the 23rd inst. Advertisers requiring additional space in next week's issue

should make their requirements known as early as possible to the advertisement manager. It would also be of considerable service to us if all who have occasion to send us blocks for illustration purposes would mark their names on the back of the same. We are continually receiving blocks with no indications as to the senders.

The London Motor-Bus.

So many unfounded rumours have been in circulation with regard to the absence of the new motor-bus on the Hammersmith to Oxford Circus route that we are pleased to be able to assure the public, on the authority of Mr. Duff, the courteous manager of the London Road Car Company, that the vehicle has given satisfaction. To quote his own words:—"We have had no reason to be dissatisfied with the performance of the car so far." But accidents will happen, and even tramcars will prove wayward. An electric tramcar collided with the steam-bus, with the result that some of the machinery of the latter became deranged. Consequently the bus had to be withdrawn for repair, but it will probably be on the road again by the time these lines are in print.

The Reading Club's Whitsun Tour.

FOR the Whitsuntide holidays the Reading Automobile Club has arranged a pleasant tour, which will doubtless be enjoyed by the participants. Mr. J. Paxton Petty, the hon. secretary, has drawn up an admirable timetable for the tour, to which we are much indebted for the particulars given on another page of the present issue. Porlock is well known to motorists. In August, 1900, Mr. S. F. Edge created some sensation by ascending that noted hill on his 16-h.p. Napier. The three miles' climb is equal to a lift of more than 1,300 feet, and comprises gradients as steep as one in six. With three persons up, Mr. Edge's car took the worst slopes at a steady rate of seven miles per hour, covering the distance from the village to the road junction in 17 min. 35 sec. A few weeks later Mr. Hickley, of Taunton—to whom reference was made in the article on "A Run to Cornwall," last week—ascended the hill on a Benz Ideal Victoria, travelling at the rate of about five miles an hour, and only stopping once in the ascent.

In Cornwall.

THESE tours undoubtedly have a splendid influence in popularising the automobile. When we spent an autumn in Cornwall and Devon two years ago, practically the only automobiles we met were those of strangers touring in the district. At Helston, the motor-car was then a novelty; now it is frequently seen in that locality, and during the last few days we have heard of several cars passing through Helston on the way to the Lizard and to Penzance. Mr. March, of Cadgwith, and Mr. H. A. L. Rowe, of Helston, are among the latest residents to become motorists, the latter having just driven home from London on a car which he intends to use for business purposes.

London to Helston.

MR. ROWE's trip was interesting and satisfactory, the whole journey from London—about 350 miles—being run without the slightest hitch. It was on a Belle car, which will be fitted with a van top for light delivery purposes in and around the town. Mr. E. J. Coles has favoured us with an account of the trip, from which we learn that on a recent Saturday, at about 5 p.m., a start was made from Pall Mall, and proceeding via Hammersmith and Bagshot the party reached Camberley in such a heavy rain that further progress was delayed till the morning. On the Sunday the journey was resumed, luncheon being taken at Salisbury, and Honiton being reached at the end

of the day—a distance of 124 miles. On the Monday a start was made for Exeter, from whence the departure took place at 11.30 a.m. with four passengers. The worst hill on the route was encountered about three miles out of the city on the Plymouth road. But the car took the whole load up without a stop. Plymouth was reached at 5 p.m. The next morning, after crossing the ferry to Devonport, a splendid run over Cornish hills and along picturesque valleys to the ancient town of Bodmin was enjoyed. After lunch the trip was concluded at Helston, where a great crowd awaited the arrival of the first resident motorist of that town.

A Case Dismissed.

So seldom is a case of alleged furious driving against motorists dismissed that we may be excused for calling attention to the case heard at Nottingham, which we fully report in another column. The Nottingham Automobile Club defended one of its members against a prosecution which ought not to have been taken, and, in the end, the Bench declared themselves satisfied that excessive speed had not been indulged in. The Club, the defendant, and the Bench are to be congratulated on the result, which should do much to cause law and justice to be respected in Nottinghamshire.

A SNAPSHOT AT CROMER.

Motor-Cars and Elections.

MOTOR-CARS are destined to play an important part in the elections of the future, and, without going so far as to say that victory will rest with those who have the largest stud of fleetest motor-cars, we are inclined to think that the possession of several cars will give a decided advantage. This was evident at the last General Election in this country, and the fact has been recognised so completely in France that a motor-car, of which we give an illustration elsewhere in the present issue, has been constructed specially for electioneering purposes. Its utility is not confined to the day of the poll. Candidates will find such a vehicle useful throughout their campaigns, enabling them to easily get to otherwise inaccessible districts and thus reach hundreds of electors in villages and small hamlets who have hitherto been neglected owing to their location. "The Motor-car as a Political Force" is a subject worthy of discussion by the Primrose League or the Liberal Federation. The use of caravans for propagandist purposes is familiar enough in rural districts, but the adoption of the motor-car would be a distinct advance.

The Motor Cycling Club.

THE first motor-cycling run ever held took place to Brighton on Saturday last, the promoters being the recently-formed Motor Cycling Club. Unfortunately the weather turned out to be very unfavourable, frequent showers rendering the roads treacherously greasy. At four o'clock at Purley corner there must have been some twenty or twenty-five quadricycles, tricycles, and bicycles, the latter predominating. The first stop was at Crawley, and then Brighton was made without a halt, where a dinner, at which about twenty sat down, was held in the evening at the Gloucester Hotel. Very few troubles were experienced, but several sideslips occurred, luckily none causing any serious damage to either rider or machine. The return journey on Sunday was accomplished in the most perfect weather, and, so far as we have been able to learn, without the slightest mishap. Quite a number of motor-cyclists are asking whether the Motor Cycling Club is the same body as that formed under the same title at the meeting held last year at the Frascati's Restaurant. Several who were at the meeting, and undertook offices in the Club then formed, seem themselves very doubtful on the point, so that some definite information from the new secretary on the subject would be interesting.

DURING the past week a motor-car, bearing the identification *plaque* which is compulsory in Paris, has been making daily trips about London.

THE death is announced from Aix-la-Chapelle, at the early age of 39 years, of Herr Franz Kupper, the first president of the West German Automobile Club.

THE Right Hon. Sir J. H. A. Macdonald, the Lord Justice Clerk of Scotland (whose chapter is one of the most interesting in the Badminton book), was announced to lecture on Motor-cars at the Royal Institution on the evening of Friday, the 18th inst.

AMONG the farewell visits of the Prince and Princess of Wales at Copenhagen was one to the Automobile Exhibition there. Next week they will further testify their interest in motor-cars by visiting them at the Agricultural Hall, London.

MR. SHELLEY, of the Hyde, Luton, husband of Lady Margaret Shelley, was thrown from his motor-cycle in Gustard Wood, near Kimpton, Herts, on Monday. His condition is said to be extremely critical.

REGARDING the new Milwaukee steam cars with the boiler under a bonnet in the fore part of the frame, reference to which was made in our last issue, Messrs. Shippey Bros. inform us that they are to be made in three sizes, of, respectively, 8 h.p., 12 h.p., and 26 h.p.

WITH regard to the motor-cycle trial at the Crystal Palace, on the 5th inst., the Secretary of the A.C.G.B.I. informs us that there was a clerical error in the time given by the time-keepers for the second ascent of the "Singer" motor-tricycle, ridden by Mr. E. Perks. The actual time was 1 min. 46 sec. (not 2 min. 46 sec.), equal to 15.43 miles per hour. This brings Mr. Perks' mean time for the three ascents to 1 min. 38.25 secs. Pedals were not used in ascending the hill by the following, viz:—No. 5, Mr. E. Perks, on "Singer" motor-tricycle, did not use his pedals during any of the three ascents. No. 7, Mr. B. Yates, on Humber motor-bicycle, did not use his pedals during the third ascent. No. 6, Mr. F. Birch, on "Singer" motor-bicycle, did not use his pedals during the third ascent. No. 9, Mr. H. Martin, on Excelsior motor-bicycle, did not use his pedals during the third ascent. The Singer Cycle Company, have sent us a long letter on the performance of their machines at the recent trials, pointing out the error in the hill-climbing test, which is officially corrected above. The Company are naturally proud of the fact that their motor bicycle and tricycle mounted the trial hill without pedal assistance and that the consumption of petrol on the bicycle was the smallest of any of the competing machines, showing that they contain the essential points for touring and general roadwork.

GLASGOW TO LONDON.

NINE entries were received for the Glasgow to London non-stop trial organised by the Western Section of the Scottish Automobile Club. Of these eight, shown in the table below, duly started on their long journey on Wednesday morning, the day's destination being York, a distance of 258½ miles, for which a maximum time of 22 hours 50 min. was allowed.

LIST OF STARTERS

8 h.p. De Dion Phaeton	...	De Dion Bouton, Ltd.
8 h.p. Motor Tandem	...	Eagle Engineering and Motor Co.
4½ h.p. Motor Tandem	...	Eagle Engineering and Motor Co.
24 h.p. Napier Car	...	S. F. Edge.
8 h.p. Argyll Light Car	...	Hozier Engineering Co.
8 h.p. M.M.C. Wagonette	...	Motor Manufacturing Co., Ltd.
20 h.p. Wolseley Tonneau	...	Wolseley Tool and Motor Car Co., Ltd.
12 h.p. Stirling Public Service Car	...	Stirling Motor-Carriages, Ltd.

Mr. Edge was the first to make an appearance at York, arriving at 4.35 in the afternoon, having made the journey in 16h. 28min. The roads were heavy, the morning was foggy, some false turns were taken in the cross-country roads, and difficulty was found with a flock of sheep, but, beyond a stoppage owing to a puncture, the car ran through without a hitch. The M.M.C. car driven by Mr. G. Iden arrived at 5.13 p.m., having been detained eleven minutes with a slight adjustment. This car had also trouble with the sheep. A minute later Mr. Stocks appeared with the De Dion car. Up to midnight these were the only three to arrive. The Wolseley car was eight hours behind time at Peebles through tyre troubles, and was not expected at York that night. The Argyll broke down when forty miles from Glasgow, and withdrew. Nothing had been heard of the two Eagle motor tandems; while as to the Stirling public service car, which was making a continuous journey to London under modified regulations, at an average of ten miles an hour, about seven o'clock a telegram was received from the driver stating that he could not come on from Morpeth owing to over-heating, and that he had wired to his company for instructions.

From York the cars were to proceed on Thursday, *via* Tadcaster, Ferrybridge, Westbridge, Doncaster, Newark, Stamford, Norman's Cross, Biggleswade, and Hitchin to London, 209½ miles from York. The maximum time allowed for the second stage was 18 hours 20 minutes, or a total time of 41 hours 10 minutes for 468½ miles. Particulars of the termination of the run will be given in our next issue.

THE question of motor-cycle racing is to be considered by a joint committee of the National Cyclists' Union and the Automobile Club.

UP to the present motor-cars have been but little seen at social functions. Probably the first time they have conveyed a society wedding party to church was the occasion of Sir Leslie Falkiner's wedding to Miss Kathleen Orde-Powlett on Wednesday, when the wedding guests arrived at the Brompton Oratory in motor-cars.

A MOTOR race for M. de Cater's cup took place on Monday. The course was uphill on the Corniche Road for a distance of a kilometre (five-eighths of a mile), with a standing start. The race was won by M. Serpollet in 59.15 sec.; Baras, on a Darracq, was second, with 1 min 3.45 sec., and Degrais, on a Mercedes, third, with 1 min. 5.45 sec.

MR. J. VAN HOYDONK returned to London last week from a successful motor-bicycle trip extending from Dieppe to Nice. He had accompanied Mr. J. Pennell as far as Nice, whence that enthusiastic motor-cyclist intended to continue to Florence, making the journey one of over 1,000 miles. The ride of 801 miles to Nice occupied exactly a week, the start being made from Dieppe on March 31st.

A RUN INTO CORNWALL.

(Concluded from page 99.)

THE following day the party wistfully scanned the skies to forecast the weather. It was very cold, and rain had evidently fallen in the night. It was decided to make a little break in the run, to call on some friends at Yeolmbridge, a little village about four miles from Launceston. The roads were in execrable condition, and here the heaviest running of the whole journey was experienced. A fully-loaded car, with four average weight adults, and quite 2 cwt. of luggage, is no light thing to

MR. EDMUNDS AND PARTY LEAVE FALMOUTH FOR THE SOUTH COAST OF CORNWALL.

propel up hills with bad surfaces and grades of one in eight, and it would have surprised no one if, under such conditions, passengers should have been shed and the car suitably lightened, but this was not necessary, and with two sets of double sprags we were enabled to face hills that otherwise it would have been foolhardy to attempt; but "Antrona's" engines never faltered, plodding away for miles on No. 1 speed up fearful grades, with such a load—certainly a great tribute to the reliability of a well-made Daimler car. It was within three miles of Launceston that a hill was encountered of over a mile in length, where the water for cooling the engine actually boiled, rapidly producing steam, which was the only time it happened on the run, but without any deterrent effect. Stopping at a well at the top of the hill, a pint of water replaced the loss, and the party sped on again towards Davidstowe, leaving St. Stephen's, Launceston, at 10.40. The cold experienced was easily accounted for on viewing the magnificent distant Dartmoor hills, covered with snow: it looked more like an Alpine scene than sunny Devonshire. The roads now, though narrow, were extremely good, and with excellent surface. At one place, ascending a stiff hill in a narrowing road, the party were aware in time of the approach of a huge traction engine with three wagons; there was only just room to pass. Had they met a few minutes earlier it would have been impossible to pass. A stiff grade of about one in twelve, a narrow lane, and a traction engine, presented peculiar conditions to the motorists, and a question was raised as to what should have been done if they could not have passed, and where it was impossible to turn round and dangerous to run backwards. It was suggested that a rope tied from the front of the motor-car to the front of the traction engine might meet the difficulty; under such conditions the car could be run backwards safely to a suitable place for passing.

In a journey of this length it is difficult to do justice to, and almost impossible to describe, all the lovely scenery we passed through, but Cornwall seems like a county

distinct and apart from the rest of England, and the scenery very different to the sister county of Devonshire. Long bleak stretches of moorland, curious quaint stone crosses passed on the roadside, the old disused workings of some tin or copper mines, present entirely new features to the traveller's view, and it was difficult to realise that we were nearly 300 miles away from London, and that the whole journey, with its varying conditions of road and grade, had been accomplished without mishap or interruption, and that the only propelling power was a little sniff of petrol vapour, accompanied by the longer breath of the fresh air through which the vehicle was travelling. Rushing quickly through Davidstow, thence on a lovely road, Camelford was reached, the approach to which requires great caution, as there is a sharp bend in the road, and old Camelford itself was indeed a surprise, with its long narrow street, which appeared as though built on the side of a roof. Sprags were instantly lowered, the horns tooted to clear the way, for there was a fair amount of traffic, and it was doubtful, if once stopped, whether "Antrona" could be got under way again without assistance, but, fortunately, no stoppage occurred, and it was with feelings of relief the party found themselves safely at the top of the stiffest hill they met with in Cornwall. Wadebridge was reached at one o'clock, and a lunch of cold beef and pickles was much appreciated. Leaving at two o'clock by another stiff hill, through lovely country, with a distant view of the sea on the west, St. Columb and Fraddon were passed through; and then one of the best runs of the journey was made over an ideal road, splendidly engineered easy down grade, by the side of the river Tresillian, on to Truro, arriving there at 3.50. "Antrona" picked up a pilot in the shape of a small boy, who guided the party to River Street, where a supply of petrol was obtained. Hurrying on, they climbed up the long hill from Truro, and down the steep run towards Penryn, then on to Falmouth, where they arrived at five o'clock.

In conclusion, it is interesting to note that the total mileage run, including several detours, made up some 330 miles from London, comprehending almost all possible conditions of road—miles of dry and dusty, miles of wet and slimy, with precipitous grades, testing both the hill-climbing and brake-restraining qualities of the car, including several miles of rough stone surface, in some cases six inches deep, and the tyres at the end of the journey, while showing signs of rough usage, and several deep

A BIT OF FALMOUTH.

cuts, appeared as firm and as fully inflated as at the start. These were not new tyres for the run, the mileage indicator on March 24th showing a total of over 3,000 miles continuous running. They have only once been pumped up since they were fitted on

November 16th last, having run almost daily throughout the winter months under the most trying conditions, the gross weight carried probably never less than 30 cwt., and often as much as 35 cwt., and with an average speed with the larger sprockets of eighteen to twenty miles, and of about fifteen miles with the smaller sprockets. On this last run electrical ignition at six volts, not four, was solely used, without a single interruption or miss-fire of any kind. Peto and Radford's batteries were used the whole time without re-charging. The plugs were ordinary De Dion, platinum wires; the induction valves, with a special form of spring devised by Messrs. Pidgeon and Bradley, obviating the use of the nut on the spindle, which, in the old type, is often apt to strip, worked admirably. The small amount of lubricating oil already referred to, being less than one quart for the whole journey, seems almost phenomenal, and probably the total quantity of water used did not exceed a gallon, and this on account of slight leakage when the engine was at rest and the tube packings had contracted. The consumption of petrol was exactly eighteen gallons, and of carbide of calcium for the Bleriot lamp about 1 lb., and though the brakes had very severe work, they were not burnt, and appeared as good and reliable as when the car left London. For some readers it may be interesting to call attention to the special form of double sprag, consisting of two rods pivoted from the same centre, the rear one being slightly longer, and attached to the front one by a chain; such a sprag is indispensable with a car of this weight, travelling up the grades and inclines found in Cornwall, and whenever first speed was resorted to the sprags were always let down, and though, fortunately, never wanted through the engines stopping or chains breaking, yet were a great comfort when having to stop for horses or sudden interruptions while going up a steep grade. It is not sufficient to rely on a good back-acting brake, because there is a moment when, working without sprag, as to whether gravity or engines get the first pull.

A journey of this kind conclusively proves the reliability of a good English-made car. The "Antrona" is a Daimler—a heavy, comfortable touring vehicle, capable of carrying five adults with full complement of luggage.

THE CALVERT BELT FASTENER.

AN improved belt-fastener for the twisted hide belts used in motor-bicycles has been introduced by Mr. G. Calvert, of Mildmay Park, N. Referring to the illustration, the fastener will be seen to consist of two steel stampings, both identical in size, the only difference being that one has an eye on end, and the other a hook. The ends which engage in the belt are of

END VIEW.

anchor form. The fastener is placed in the central core or hole running through all twisted wide belts, the two anchor prongs engaging on opposite sides of the same, thus giving hold on the full thickness of the leather available. There being a central pull only between the belt and the fastener, it is claimed that there is no possibility of the fastener opening, the strains being equally balanced. Moreover, the fastener is sheltered from any contact with the belt pulleys, thus preventing any clicking noise as the fastener passes over the same.

THE Charing Cross Syndicate, Limited, has been registered, with a capital of £10,000, to construct locomotives, motor-cars, etc.

CONTINENTAL NOTES.

BY AUTOMAN.

A FEW years ago it was quite a privilege and an adventure to have a ride in a motor-car. Since then, as automobilism has become more generalised, it has been a pleasant recreation for the rich and for the holiday-maker to take a ride in a motor-car. A certain proportion of vehicles have doubtless been used for strictly utilitarian affairs, but the vulgarisation of the motor-car has become such an actuality that it is almost without surprise that one reads of the prison van of Nuremburg being a self-propelled vehicle. Even the criminals and malefactors of Nuremburg will have the advantage of making acquaintance with self-propelled traffic.

THE Nice fortnight has been a failure from almost every point of view, misfortune after misfortune having dogged its footsteps. In the first place, there came the suppression of the Nice-Abbazia race, and then fog covered La Turbie hill when the climbing contest took place, making the contest dangerous and reducing the speed. On the Tuesday and Wednesday, when there was no racing, there was lovely sunny weather, but on Thursday, the day which had been set out for the mile race, wind and rain made it impossible to proceed, and a shocking side-slip of Page's Decauville put an end to the day's proceedings, which were put off till the morrow. But the bad luck still held on, and it was not until Sunday that it was possible to hold the contest. It may be said that the only redeeming feature of the week was a splendid performance of M. Leon Serpollet on his new 20 h.p. car, on which he lowered the world's record and won the Rothschild cup by doing the kilometre with a flying start in 29½ seconds, at a speed of over 120 kilometres an hour—that is to say, more than seventy-five miles an hour. In the mile race the following were the winners of the different classes:—

Motor-bicycles, Williams, on a Clement, 1 min. 12½ sec.
Motor-tricycles, Osmont, on a De Dion and Bouton, 57½ sec.
Voiturettes, Guillaume, on a Darracq, 1 min. 27½ sec.
Light Cars, Baras on a Darracq, 1 min. 10½ sec.
Cars, Degrais, on a Mercedes, 1 min. 9½ sec.

The following were the record makers of the day for the kilometre with the flying start:—

Serpollet, 29½ sec.

Osmont, 33 sec., exactly equal to Rigal's best time.

The honours of the meeting rest, therefore, with Serpollet and Osmont; whilst amongst the big cars the new 40 h.p. Mercedes carried off the hill-climbing trial, in which, however, Panhard and Levassor did not compete.

THE new Mercedes is certainly a very fine car, and it is greatly to be regretted that Panhard and Levassor, disgusted with the abandonment of the Nice-Abbazia race, went home without competing at La Turbie. The Mercedes is, of course, a four-cylinder car designed by Maybach, with a motor which runs at a speed varied between 150 and 1,200 revolutions a minute. I say this advisedly, as the regulation is so perfect that the speed can be reduced to 150 turns a minute by simply turning a handle which actuates a choked valve on the admission. The ignition is by magneto with a make and break spark; the admission and the exhaust are regulated together, and therefore work in unison; and the motor weighs between eight and nine pounds per h.p. developed. The radiator is similar to that which has always been employed on Mercedes cars, with this difference, that instead of there being a fan the flywheel of the motor supplies the current of air when the car is standing. Only one gallon and a half of water is used, and this evaporates so little that in the whole day's run the loss is inappreciable. Both the change of speed gear and the friction clutch are new, and all the bearings and the wheels run on balls. Chains are still used.

HISTORY repeats itself in automobile as in other worlds, and again Serpollet and Mercedes have been practically the only ones to benefit by the races on the Littoral. No one will begrudge M. Serpollet the success that he has worked so hard to achieve; indeed, his record was hardly made before a banquet was arranged to commemorate the event, and to this the principal automobilists have readily subscribed.

THE Association Générale d'Automobiles has just issued a manifesto, in which it is said that "the Association does not propose to interfere with the A.C.F., which is its founder; it addresses itself particularly to the great masses; it is general, as its title implies, and accessible to anyone. Its utility is incontestable for amateurs, for thinkers, for technicians, inventors and workers; each will find their place in it. The amateur and the thinker will find indications helpful and interesting, and will contribute to the general good by formulating their plans, which will be duly registered and put before the most suitable persons, having all the authority and competence of such a multiple association. The inventor will find in the Association publicity for his ideas, and from the tribune he will be heard by the technician and the capitalist. Our Association will take in hand things of general interest which single-handed would lie idle. It will be a link between the employer and the employed, between the seller and the buyer, grouped together under the same flag and with the same purpose. This flag, a sign of union, will be for us what the Touring Club's flag is to the tourist. We shall work hand in hand with the Touring Club, trying to do for the automobile what it has done for the cycle."

AN automobile fête is to be held at Eisenach, Germany, from the 23rd to the 30th July next. On the first day the start will take place, at Leipsig, of a trial of heavy motor-vehicles, between that town and Eisenach, the cars reaching the latter place on the 24th. On the 25th the competing cars will be on exhibition. A congress of motorists and a run to the Wartburg will be held on the 26th, while on Sunday, July 27th, there will be a race to Meiningen and back, followed by a pleasure run to Reinhartsbrunn, where a concert will be held. The fête will be brought to a conclusion by a three days' tour in the Thuringian Forest, leaving Eisenach on July 28th.

A STEAM road transport service is being established by the military authorities in South Africa, and experienced traction engine drivers are now being appointed.

Two motor-car drivers' licences have just been granted by the Folkestone Town Council to employees of the Folkestone Motors, Ltd.

MR. SHRAPNELL SMITH, of Liverpool, has lately borne witness, on his face, of a nasty sideslip in which he indulged while motor-bicycling.

MR. F. GUY LEWIN, who, last year, went from Land's End to within fifty miles of John o' Groat's on a motor-car, intends to make a trip from end to end of Ireland on a 7 h.p. voiturette during the coming summer.

BETWEEN Bournemouth and Southampton is Milford-on-Sea, through which many motorists pass during the season. Messrs. Fred Keeping and Co. have every convenience for supplying their wants.

MR. R. J. MECREDY has written a useful little pamphlet on the mechanism and management of the Excelsior motor-bicycle. It extends to about sixty pages, and in a preliminary chapter on the internal combustion engine the author refers to the various parts of the Excelsior engine. Chapter III. deals with driving, and the fourth with the care and management of the engine and bicycle. Thirteen pages are devoted to roadside troubles, and the only suggestion we would make is that future editions should be supplied with an index.

THE D'EQUEVILLY VALVE ARRANGEMENT FOR PETROL MOTORS.

AS every motorist knows, the exhaust valve suffers greatly from the heated draughts expelled through it; even where a water jacket is used, the effect of cooling cannot readily transmit itself to the valve, as it does not form an integral part of the jacket, but merely lies in contact with the same. It is equally well known that the mixture of vapour and air admitted through the induction valve is extremely cold—owing to the continued evaporation of the spirit, so much so that a by-pass from the exhaust is usually run through the carburettor, or other means are adopted to raise the temperature of the latter, or at least part of it or its connections. The latter fact is cleverly utilised in the valve under notice so as to neutralise the former, the description of which is taken from *La Locomotion Automobile*. The illustration represents an air-cooled cylinder head,

pierced along its centre by a very large exhaust valve E, the cap F of which is connected with the two-to-one motion shaft by rods not shown. A strong spring, I, draws the valve back. The head and stem of this same valve are, however, recessed and bored out to receive the induction valve D, which is in communication with the carburettor of the inlet pipe by means of holes in the centre part of the stem E. The stem of the valve D is fluted as shewn in the section across the line AB, forming four channels for the charge to pass through to the head of the valve. A light spring H on the upper end of the stem is provided to close the port. By these means the inrush of cold vapour passing actually through the stem and head of the exhaust valve is enabled to cool the latter in a much more effectual manner than could be done by any water jacket. One result of the relative situations of the valves and their springs is particularly noticeable: the spring of the exhaust valve is of course much stronger than that of the inlet valve, and closes its port with such rapidity that the shock of the valve head so reacts on the induction valve, which is seated inside it, that it is bounced just at the moment when suction is begun, and the latter is, open

F

of course, materially aided. In actual test, a 4 h.p. motor, of 90 mm. bore and 110 mm. stroke, and cooled by radiators only, has been found to run in an enclosed workshop for several consecutive hours at a speed of 1,800 revolutions a minute, without the valves ever rising to a heat at which they could not be well touched by the bare hand. The valve is made by M. R. d'Equeville, of Avenue de Wagram, Paris.

THE FISCHER COMBINATION PETROL-ELECTRIC CAR.

THE question of designing a successful combination petrol-electric car appears to be exercising the minds of automobile constructors in different parts of the world. Mr. Jenatzy's record-breaking vehicle is already fairly well known, while more recently the Lohner-Porsche car, described in a recent issue, has been attracting attention. We are now able to give a brief description of a combination vehicle recently turned out by the Fischer Motor Vehicle Company, of Hoboken, N.J., U.S.A. The system consists of a combined petrol engine and dynamo, one electric motor for each (rear) driving wheel, a small storage battery and controller. It will be noticed from the illustrations that there is no mechanical connection between the engine shaft and the road driving wheels. The dynamo, therefore, is free to run at a practically even speed, producing a constant supply of electricity. The electric circuit is so arranged that when running the vehicle under normal conditions (loaded on the level) the current goes directly from the dynamo through the controller to the motors; but when descending inclines, slowing up, or in general when less power is

needed than that furnished by the engine, the current is automatically taken up by the battery, which is connected to the wiring at a point between the dynamo and the controller. Again, when extra power is needed, as in ascending steep grades or starting heavy loads, the battery promptly furnishes the deficiency. This action, carrying the peak of the load, does not have to be watched by the driver, being entirely automatic. As the output of the engine does not vary, no governor is required, and the gas and air mixtures can be set permanently for perfect combustion, so ensuing economy in fuel. Another important and convenient feature is the starting of the engine, which is accomplished by simply throwing in a switch controlled by the driver.

The front portion of the frame carries the petrol engine, dynamo, controller, and steering gear. The front axle is trussed somewhat on the principle of a bridge, and carries extra long and flexible platform springs bolted to the brackets on the frame. The rear axle, with the wheels, springs, two motors and reduction gears, forms a complete driving unit. All parts subject to wear are entirely encased so as to be properly lubricated and at the same time protected from dust and moisture.

The power equipment consists of a 10-h.p. three-cylinder petrol engine, running at a speed of 600 revolutions per minute. Directly on the engine shaft is placed the armature of a 5-kilowatt, 110-volt dynamo. The motors are of a special "twin" type (built together) of 5 h.p. each. The controller is of the series parallel type, giving five forward speeds from $2\frac{1}{2}$ to ten miles per hour, and two reverse speeds, all controlled by one lever. The batteries consist of fifty cells of ninety ampere-

hour capacity. It is reported that the London Road Car Company are in negotiation with the Fischer Company with regard to trying an omnibus built on this system in London.

THE READING CLUB'S WHITSUN TOUR.

AT Whitsuntide the Reading Automobile Club will have a tour to Porlock, Reading being left on the morning of Saturday, the 17th prox., about 6 a.m. Via the Bath road, the party will journey to Hungerford, where breakfast will be taken, and then on to Westbury and Frome. Dinner will be taken at the Star Hotel, Wells, and on resumption the way will be continued through Glastonbury and Taunton to the Red Lion Hotel, at Dulverton. Dulverton is a most attractive village, twenty-five miles from Porlock. On Whit-Sunday morning the journey to Porlock Weir will be resumed, and there the party will find much of interest until Tuesday morning, when the return journey of 140 miles will be made via Bridgwater, Wells, Bath, Calne, and Hungerford.

Some remarks as to contour, etc., will be of general interest. The main Bath road from Reading as far as Hungerford is well known. Just before entering Froxfield the road to Westbury lies over the northern fringe of Salisbury Plain, and is undulating in character, and of excellent surface. Many pretty villages are passed through, notably Pewsey, Easterton, Market Lavington, and Earlstoke. There is a considerable rise out of Westbury towards Frome, but the surface is good. The first hill of any consequence is met with in Frome itself, where the gradient, for a short distance, is one in nine. There are several short hills between Frome and Wells, especially in and near Shepton Mallet, and there is a sharp descent into Wells.

From Wells to Taunton (thirty miles) the road is almost flat, and is inclined to be rather loose over Sedgemoor. From Taunton to Milverton the surface is excellent and the gradients easy, but between Wiveliscombe and Venn Cross Station (four miles) there is a fair amount of stiff climbing. Between Venn Cross and Bampton the road is much easier, but for the following two miles to Exebridge it is again stiff. The remaining two miles to Dulverton are easily negotiated.

The village of Dulverton will speak for itself. The road thence to Dunster is one of extreme beauty, and the surface is excellent. From Exton (five miles from Dulverton) the gradient becomes somewhat trying until the top of the moor is reached (1,000 feet) at Wheddon Cross ("Rest and be Thankful" inn). Thence the road descends through Timberscombe to Dunster in an almost unbroken descent of seven miles. Dunster is an exceedingly quaint and charming place, and the road onwards to Minehead still descends slightly. The Porlock road hardly enters Minehead, but bears to the left at the entrance to the town, and proceeds in easy undulations for the remaining six miles, with beautiful views all the way to Porlock, and ends at Porlock Weir, at the Anchor Hotel, which stands on the beach in full view of the Bristol Channel.

MR. E. S. HYDE has a garage and stocks petrol at the Square, Stow-on-the-Wold.

THE Hungarian postal authorities are about to make some experiments with motor-vehicles, the order for which has been placed with Messrs. Cudell and Co., of Aix-la-Chapelle.

MR. ALEXANDER WINTON, of Cleveland, U.S.A., is building a new and powerful racing machine with which he intends to make an attempt on the world's record.

A DISPUTE has arisen between M. A. Wydt and M. P. Gans de Fabrice, both of Paris, as to who owns the patent rights in the "electro-catalytique" ignition method for petrol motors.

A CORRESPONDENT writes:—"The report in the daily press that a Warsaw innkeeper keeps a motor-car in which his customers are driven home free of charge between the hours of 10 p.m. and 2 a.m., is too good to be true."

THE EXHIBITION AT THE AGRICULTURAL HALL.

IN 1896 the first of the series of annual motor-car Exhibitions at the Royal Agricultural Hall, Islington, was held, Mr. Charles Cordingley thus providing the British public with an early opportunity of appreciating the vehicles that are now playing an important part in the industry and the pastimes of the country. On that occasion many crude efforts at mechanical traction on the roads were exhibited, many of them being of such a rudimentary character that they can now only be regarded as curiosities.

Then in each succeeding year one display of automobiles followed another until the Exhibition attained very large and

advantage of the publicity and prestige that accrued from association with the representative Exhibition while the proprietary interests remained as before.

Under such a scheme the sixth annual Exhibition took place in April, 1901, and great was the interest created, the display attracting a large number of foreign as well as all the leading British manufacturers. Every exhibitor was well satisfied with the business done, and in June a resolution was agreed to by the manufacturers as to having the next Exhibition in March or April, which encouraged Mr. Cordingley to make a contract to take the Agricultural Hall, London, for 1902 and 1903—in April in the present, and in March in the next year.

Thus we arrive at the date of the Exhibition to be opened to-day (Saturday), which will, we venture to assert, testify to the organisation and experience which have been utilised in bringing together more than 250 firms engaged in the motor industry.

"LE PASSE-PARTOUT," ON WHICH DR. LEHWESS AND PARTY WILL TOUR THE WORLD.—THE CAR BEING PREPARED FOR THE EXHIBITION AT THE AGRICULTURAL HALL.

important proportions. Its work of educating the public was being manifested, not only in an increased attendance, but also in the growing number of exhibitors. In fact, there were some who thought an Exhibition further from the centre of London would be welcome, and, consequently, a show was organised by the Automobile Club at Richmond Park, which did not, however, prove attractive to the general public, and actually involved the promoters in a loss of more than sixteen hundred pounds.

Arrangements were then made between the Automobile Club, on the one part, and the proprietor and organiser of the Agricultural Hall display on the other, for an amalgamation of forces for the Exhibition of 1901. To help the Club to meet the deficit they had sustained in their promotion of an Exhibition Mr. Cordingley agreed to pay £200 a year, while the Club agreed that their name should appear in connection with the venture, thus having the

The display will be an International one—France, Belgium, Holland, the United States, and Germany being represented as well as the United Kingdom. Petrol, steam, and electrical vehicles of the latest types will be shown, and, in addition to novelties in design, several interesting cars will be on view, including a steam car that has done duty in connection with the war in South Africa. The new 22-h.p. Daimler car built for the King and the racing Mercedes car, bought by Mr. A. Harmsworth, which attained a phenomenal speed at Nice last week, will be shown, and also the 20-h.p. Panhard car upon which Dr. Lehweß is to tour the world, the start being made from the Agricultural Hall on Wednesday, the 23rd inst. An illustration of this interesting vehicle is given above.

In addition to light pleasure cars the Exhibition will contain a great variety of heavy industrial vehicles, so that the utilitarian aspect will by no means be ignored.

THE NAPIER ANNULAR INLET VALVE.

AMONG the small detail improvements in the latest type of Napier cars is an improved form of inlet valve, of which sectional illustrations are given herewith, Figs. 1 and 2 being sections of a valve; Fig. 3 a plan of the valve; and Fig. 4 plan of the seating. The valve consists of a hollow casing, cylindrical in shape, the casing being adapted to be fixed to the engine, and having an annular seating formed upon its inner end. Centrally within the casing there is secured, by means of radial ribs, a bearing for the valve spindle, the inner end of the bearing being formed as a seating. The valve proper is annular in shape, is connected by means of the radial ribs with a central boss carrying the spindle which passes through the bearing, and has arranged in connection with it a spring to normally hold the valve upon its seat.

Referring to the illustrations, *a* is the hollow casing and *b* is the annular seating which is formed upon its inner end;

FIGS. 1 AND 2.

FIGS. 3 AND 4.

c is the bearing which is arranged centrally within the casing *a*, being secured thereto by means of the radial ribs, *d, d*; the inner end of this bearing is also formed as an annular seating *e*. The valve spindle *f* is supported in the bearing *c* and carries the valve proper. The latter comprises the annular parts *g, g'* which make contact with the annular seatings *b* and *e* respectively, and is connected with the arms *h, h* with the central boss *i*, to which the spindle *f* is secured; the underside of the boss *i* is made conical in shape as shown at *j*, the conical portion fitting, when the valve is closed, into a conical recess *k* upon the central bearing *c*. A spiral spring *l* is coiled around the bearing *c*, and abuts at one end against a shoulder upon the bearing and at its other end against a collar *m* which is held upon the spindle *f* by the key or cotter *n*. As above stated, Fig. 1 shows the position of the valve when closed; when, however, the valve *g, g'* is withdrawn from its seat by the suction action of the engine, the explosive mixture which is to be supplied through the valve has a supply passage of a larger cross sectional area than is the case with an ordinary valve of the same lift, as it can flow not only through the annular inlet as indicated by the arrows *o, o*, Fig. 2, but also through the spaces *p, p*, left between the radial ribs *h, h*, as indicated by the arrows *q, q*, so that a considerably greater inlet area is provided than with an ordinary valve having the same lift.

The advantages claimed by the Motor Power Company, Limited, for the new valve, which has been patented, in comparison with the ordinary inlet valve of the same size, are as follows:—The ordinary inlet valve with a lift of three thirty-seconds of an inch has an area opening of '47 square inch. The Napier valve has an area opening of '72 square inch. If, however, a

comparison is made between an ordinary single-port valve, the old Napier three-port valve, and the new annular valve, the areas are as follows:—Single-port valve, '625 square inch; three-port valve, '79 square inch; new annular valve, '875 square inch. The advantages in a fast-running engine and gain of power for a given size of valve will be obvious from these figures.

PROGRESS IN STEAM CARRIAGE CONSTRUCTION.

OPINIONS differ among steam-carriage builders as to what extent the accessories and refinements of modern stationary steam plants are adaptable to automobile practice. Signs are, however, not wanting that the trend of the times, at least among the more progressive manufacturers, is toward a number of features which are characteristics of modern steam engineering in large plants. If the movement in this direction continues, the steam-carriage will lose some of its primitive simplicity, but it is to be expected that the gain in all round efficiency will far outweigh this loss. The objects aimed at by the improvers of the steam-carriage are the following: To make the carriage a long-distance vehicle by providing means to make one supply of water last at least seventy-five miles; to reduce the fuel consumption and thus the running expense; to provide greater safety from fire in the hands of inexperienced users, and to minimise the attention required by the power equipment while running and the manual labour of pumping.

Both the range or mileage of the vehicle (which is limited by the water carried) and the fuel economy are dependent upon the steam economy of the engine, and one would therefore expect the engine to be a promising subject of improvement. Considerable work has actually been done to improve the steam economy of automobile engines, although the majority of builders still stick to the simple engine with two double-acting cylinders, using saturated or slightly wet steam. Compound engines are used by several of builders who use saturated or only slightly superheated steam, while others employ highly superheated steam, and thus secure an even higher steam economy. With steam superheated to such a degree that some superheat remains even in the exhaust as it leaves the engine, apparently nothing can be gained by compounding, since the chief object of compounding is to reduce cylinder condensation—which does not occur here. The only possible gain would seem to be in the direction of a greater ratio of expansion.

One of the chief objects of experimenters with paraffin burners seems to be to eliminate the risk of fire in steam-carriages. A good paraffin burner has, however, also other advantages, since paraffin has a greater heating value and is cheaper than petrol.

Automatic feeders which dispense with the necessity of watching a gauge-glass, and of alternately closing and opening the by-pass have been invented in large numbers, and quite a few carriages are now supplied with them. The use of a power pump for the air pressure of the fuel tank is becoming general, and independent steam-pumps for water are also being used in increasing numbers. In future, therefore, there will be less occasion for manual exertion on the part of users of steam-cars than there has been in the past.

A MOTOR-BICYCLE wedding is the latest matrimonial venture brought to our notice, two Leyton residents having gone to the altar, or as far as the church doors, mounted on motor-bicycles. Appropriately enough, they left the church mounted on a tandem.

As Dr. A. F. L. Dorin, the well-known police divisional surgeon of Clapham, was driving his motor-car along South Lambeth Road, the other afternoon, an escape of petrol occurred, which unfortunately came in contact with the boiler and the lighted jet, with the result that all became ignited and burst into flames. The car was very considerably damaged, and was conveyed to Dr. Dorin's residence minus a good deal of its spick-and-span brightness and smart appearance.

THE ELECTRIC IGNITION OF COMBUSTIBLE GAS-MIXTURES.

AT a recent meeting of the Reading Automobile Club a paper on the above subject was read by Mr. A. Phillips, of which an abstract is given herewith:—

The most vital part of an internal-combustion motor lies within its combustion chamber. The explosion of the gases here constitutes its very heart-beat; for, should this fail, then its circulation fails also, not the least important being the circulation of the fly-wheel. In order to ignite the explosive gas-mixture present under compression in the cylinder of the motor, heat must be applied at a given moment. The means most commonly employed for this purpose is to introduce through the walls of the cylinder an insulating porcelain tube, carrying the wires which form part of the secondary circuit of an induction coil. The ends of these wires are brought near together at their extremities, leaving a small gap in the circuit across which is transmitted the

the current. The battery employed in a motor-car usually consists of two elements, or cells, which are incapable in themselves of developing a high pressure or electro-motive force, and are therefore unable to maintain a current against resistance. The resistance of the air-gap being very high, it is necessary to considerably increase the low-tension battery current; to effect this is the function of the induction coil, which transforms the primary current of low tension, but comparatively large amperage, or quantity, into a secondary current of high electro-motive tension with a relatively diminished current. Thus the total energy remains the same, although the component volts and amperes may vary.

When, by means of a "trembler," or contact-breaker, the battery current comprising the primary wire of the induction coil is closed, the electro-magnetism of the core induces a current in a direction opposed to that of the primary current, and tends to retard its instantaneous passage. Again, when the primary current is broken, an induced current is generated in the circuit

A LOCOMOBILE IN CALCUTTA.

rush of sparks from the induction coil. The temperature of these sparks is considerable, and proportionate to the current passing the points. Properly speaking, the heat of the discharge is due to the resistance of the air, or other gases, through which the current passes; while its visibility is due to the ignition of the gas molecules in its path, and also of particles of metal torn off the platinum points by the discharge. Possessing these qualities, the electric spark is admirably adapted to effect combustion of explosive gas-mixtures and to insure the chemical combination of their constituent atoms. There is a variety of methods of electrical spark ignition, each possessing some distinctive feature of interest. The high-tension system, which consists essentially of a primary or secondary battery, induction coil, contact-breaker, etc., is adapted by the manufacturers of the De Dion and Benz type of motor-car; while the low-tension system is represented by Simms-Bosch, Moss, and Lanchester. In the latter system advantage is taken of an induced current, termed the "extra current," a dynamo usually replacing the accumulators to supply

in the same direction as the battery current, and produces what is generally referred to as the extra current, which takes the form of a bright spark at the point of interruption; the high tension of this current making it possible for it to leap over the separating points of the break. The effect of this extra current on that directly induced in the secondary coil is to lessen very materially its tension. In order to obviate this prejudicial effect a condenser is usually employed in conjunction with the induction coil, and this tends to absorb or suppress the extra current. It follows, then, that the device used as a "trembler," or contact-breaker, should be as rapid as possible in its action.

In order to be able to gauge the amount of energy given out by the explosion of various gas-mixtures, I have constructed a special apparatus, consisting of a metal cylinder about 10 inches long, closed at both ends and fitted with a piston and piston-rod. The latter carries a projection which engages with and actuates a movable pointer over a graduated scale. A sparking plug is placed in a suitable position below the piston, while tubes inserted

into this space serve to convey the gas-mixtures to be exploded. The action of the apparatus is as follows:—

When the gas-mixture, which in every experiment is of equal volume, is fired by the electric spark, the piston is driven up by the explosion and compresses the air in the upper chamber the amount of compression and consequently the energy exerted by the expansion of the gases is registered by the pointer, which remains in position after the return piston stroke.

Too feeble a spark causes imperfect combustion and consequent soot deposit. This proves, of course, that without a good spark the engine does not develop full power. The spark-gap should always be placed where it is surrounded by combustible mixture uncontaminated by burnt exhaust residue. I found that the most powerful results were obtained by using a mixture of 5 per cent. of gas. It has been suggested, I believe with great reason, that a "fat" spark, having a necessarily greater surface than a "thin" one, will ignite simultaneously a correspondingly larger amount of gaseous molecules surrounding it; and that these ignited molecules, transferring their ignition to others in their immediate neighbourhood, would thereby give a more instantaneous explosion.

This is an important consideration, for such an explosion will create more heat, and therefore give more force than a slower one, and the combustion will be of a higher form than under reverse conditions. Owing to a peculiar property belonging to gases which have a mutual affinity, their volume is decreased by chemical combination. Petrol is a hydrocarbon having a high percentage of hydrogen, and when combination or oxidation takes place in the cylinder this condensation will naturally tend to diminish the pressure by lessening the volume of the gas, and so oppose the effect of the elevated temperature, which increases the pressure by increasing the volume in the ratio of 1 : 273 of its volume for every accession of one degree centigrade. This fact, then, would well account for the highest efficiency of an internal combustion motor being at its highest speed; for if the piston travelled slowly after an explosion there is necessarily more time both for this condensation and for the temperature to become lower.

This feature of condensation is well represented by a piece of apparatus termed an eudiometer. It consists of a stout glass tube closed at one end, having an internal diameter of half an inch, and bent into the form of a U. Two pieces of platinum wire fused into the glass at the closed extremity serve to convey the passage

of an electrical spark. This closed limb is graduated to about half its length. The tube is filled with mercury, and the gases to be examined are passed into the closed end of the tube, thereby displacing the mercury, which indicates by its level on the scale the volume of the gases. A spark is then passed across the platinum points and the explosion ensues. The diminution of the volume of gases caused by condensation or combination is then read off the scale and compared with the original volume.

We have now to consider what effect the compression of the explosive gases has upon the high-tension spark. This can be conveniently shown by an instrument consisting of a spherical glass vessel with an open neck above and below. A brass fitting at the upper end has an air-tight stuffing box, through which an electrode can be moved to regulate the sparking distance of

the points within the globe. The lower neck of the vessel is fitted with a stop-cock, pressure gauge, and an attachment for a pump. As the pressure rises by pumping in air the sparking distance rapidly decreases. The density of these gases largely influences the sparking distance, and not only the density but also the chemical composition.

I was led by some observations in these experiments to try to discover the rate of explosion of gaseous mixtures. This I was able to accomplish fairly approximately by a very delicate apparatus, comprising a stout glass tube 10 feet long and $\frac{3}{4}$ -inch diameter, at one end of which is a sparking-plug. Electric contact-makers of peculiar construction are placed at intervals of 12 inches along the tube and are connected in parallel to a circuit comprising a battery and an electro-magnet. To the latter is attached an armature carrying a light stylus, or pen, the whole

AN AUTOMOBILE ELECTIONEERING PLATFORM. (See page 113.)
La France Automobile.

being mounted over a rapidly revolving drum moving with great regularity and covered with smooth paper. After the gas-mixture to be examined has been introduced into the tube, it is fired by a discharge from a Leyden jar, having a special timing device which ensures a galvanic current passing simultaneously through the electro-magnet already alluded to. The action is then as follows:—The explosive wave having reached the first contact-maker in the tube, it closes by its action the battery circuit, and a current passes through the electro-magnet. The armature is immediately attracted, bringing the marking stylus in contact with the paper on the revolving drum and registering on this a line or dot. The explosive wave passing along the tube reaches the second contact-maker, and the same cycle of operation is repeated. When the explosion has travelled the whole length

of the tube, the stylus will have registered ten dots on the paper. It is then a matter of simple calculation, knowing the circumferential speed of the revolving drum, to compute the relative velocity of the explosion, or, more correctly speaking, of the propagation of the explosive wave of various gas-mixtures.

Several items of interest relative to the working conditions of an internal-combustion motor were deduced from these experiments. These are as follows:—The rate of explosion is independent of the diameter of the tube above a certain limit. With rise of temperature the rate falls. With rise of pressure the rate increases. While experimenting with this tube I was struck by the fact that, although using the same mixtures and working apparently under the same conditions, the rate of the explosive wave gradually decreased from the first experiment. It was some time before I discovered the reason of this, which was very simple. The chemical combination of the two gases had gradually caused an accumulation of water on the walls of the tube, and it was this moisture which had such a marked effect on the rate. The wave is propagated by the movement of burnt molecules and also by those heated and unburnt. When the products are perfect gases the explosive wave travels at a velocity which agrees approximately with that of sound, viz., 1,140 feet per second.

THE "CROISSANT" IGNITION SYSTEM.

QUITE a number of new ignition devices made their appearance at the recent automobile exhibition in Paris. We have already referred to M. Wydt's "Allumeur Electro-Catalytique," and now are able to give a brief description of another system—the "Croissant"—introduced by M. Allain, of Anet (Eure-et-Loir), France, in which the use of dry batteries or accumulators is dispensed with. The arrangement, which was shown fitted to a tricycle, as indicated in Fig. 4, consists of a high-tension induction coil and current generator combined in one. The inventor conceived the idea of driving an induction coil at a uniform speed of rotation within a permanent magnet and to collect the current therefrom at the required moment. This, owing to the mutual induction between the two windings, is not

FIGS. 1, 2, AND 3.

directly practicable, but the difficulties have been overcome in the following manner:—A permanent magnet, O (Fig. 2), of circular form is provided with two end bearing plates, A A, in the bearings of which turns the shaft B, which supports the induction coil C. This coil rotates within the circular magnet, the shaft B being driven from the engine. The coil has two windings, the extremities, *x*, *y*, of one of which, *a*, composed of heavy wire, are connected to the interrupter I (Fig. 3); the other, *b*, of fine wire, has one of its terminals earthed and the other one connected to a contact,

d, carried by an insulating plate. The current induced at each revolution in the winding *a* is interrupted at K by the raising of arm *g* by cam *h*. The interruption of this current induces in the secondary circuit a momentary current, which from contact *d* flows through brush *e* and the wire connection *f* to the sparking plug, jumps across the gap between the plug terminals, and returns through the engine frame, to which, as stated, the other extremity of the coil is earthed. Provision is made for advancing and retarding the sparking, this being effected by means of the handle D, which moves the stationary part of the spark generator in relation to the

FIG. 4.

rotating coil through a certain angle. The generator may be driven directly from the engine shaft, as shown in Fig. 1, or may be actuated from it by any convenient positive transmission device. It is claimed for the apparatus that it is less bulky and weighty than the usual arrangement of accumulators and induction coil. The only external piece that needs attention is the conductor connecting the apparatus with the sparking plug, so that the chance of ignition troubles due to short circuits or faults in the wires is greatly reduced.

WE are informed that a commercial traveller has run over 6,000 miles during the last two years on a 5-h.p. "Knight of the Road" car without having to make repairs of any kind.

THE Athletic Sporting Association, Limited, has been registered, with a capital of £507 in £1 shares, to adopt an agreement with Mr. E. M. Chennell, and to carry on the business of cycle makers, motor-car builders, etc.

LOOKING back over the last year, it is astonishing to see the great number of improvements that have been made in motor-vehicles, and it is safe to say that no other branch of engineering has ever seen an equally rapid advance within a corresponding period.

M. ANDRE A. GODIN has removed to 9, Little James Street, Gray's Inn Road, W.C., where he will carry on the sole agencies for this country of E. Selaverand's valves, pumps, etc., H. Hommen's coils, and G. Ducellier's lamps. The latter is a special feature, and at the Exhibition he will have a good collection on view.

THE East London Rubber Company, of 211, Shoreditch, E.C., who have lately established a motor department, have just issued a most complete catalogue of motor parts and accessories. Everything from a sparking plug to a complete car is comprised in the list, which should prove useful to all motor agents in the country.

The Martini Petrol Lorry.

A SWISS firm, Messrs. F. Martini et Cie, of Frauenfeld, have lately taken up the construction of heavy petrol vehicles. Figs. 1 to 3 show a lorry built by this firm; it is fitted with a 12-h.p. four-cylinder motor situated in the fore part of the frame. To economise space the cylinders are arranged in pairs opposite each other, and are inclined V shape, so that the piston-rods work on one shaft with two cranks. The cylinders have a bore of 95mm., and the piston stroke is

for three forward speeds of three, seven, and eleven kilometres an hour and a reverse motion. The advantage of the two trains of gear wheels is that the gear can be changed from the lowest to the highest speed without passing through the intermediate one. The two trains are operated by one lever at the side of the driver.

An original feature of the lorry is the design of the secondary, or "false" frame, which carries the motor and transmission

FIG. 1.—GENERAL VIEW.

130mm., the normal speed being 750 revolutions per minute. Contrary to the usual practice in this type of engine, the combustion chambers are horizontal, so as to give a vertical movement to the exhaust valve rods. Ignition is effected by the Simms-Bosch magneto device. The motor is regulated by a hit-or-miss governor actuating a special form of sliding valve, and

mechanism. The main frame is composed of large channel sections, and is suspended on laminated springs. The secondary frame is made of two smaller members of channel sections, the ends resting on the rear axle, while the opposite ends terminate in forks just behind the front wheels. Hanging brackets bolted under the main frame contain spiral springs, between which are

FIG. 2.—SIDE ELEVATION.

it can also be operated independently by hand to vary the speed as required. The engine is carried on a bed bolted to the lower flanges of the channel sections forming the side members of the lorry. A universal-jointed shaft transmits the power from the motor, through the medium of a friction clutch, to the change-speed gear, which is placed near the rear axle. The gear consists of two separate trains of fixed and sliding wheels arranged

FIG. 3.—END ELEVATION.

the pins passing through the forked ends. By this arrangement any vertical movement of the front part of the vehicle is taken up by the spiral springs, and prevents strains being communicated to the driving gear.

There is no water tank, this being replaced by a new form of radiator in front of the vehicle, consisting of a large number of flattened tubes, between which air is driven by a fan on the

crank shaft. Owing to the large radiating surface it is claimed that when the lorry is running at low speed under a full load the temperature of the water never rises above 65 deg. Cent., and there is consequently no danger of heating when ascending long gradients. The quantity of water carried is twelve litres, and it is said that there is practically no consumption. The circulation is maintained by a gear-driven pump. The cold water is drawn from the bottom of the radiator, the heated water returning at the top.

The road wheels are of the artillery type with broad iron tyres, the front wheels having a diameter of 2ft. 11in., and the driving wheels 3ft. 3in. The distance between the axles is 11ft. 6in., and the width of track is 4ft. 6in. Steering is controlled by a horizontal wheel on a vertical pillar, around which are grouped the levers for advancing and retarding ignition. Besides the foot brake acting on the differential, there is a lever for operating powerful tyre brakes on the rear wheels. The weight of the lorry is 2½ metric tons, and it can carry a load of 3½ to 4 tons.

MOTOR UTILITY.

ALTHOUGH the value of the motor-vehicle is naturally most appreciated in connection with the conveyance of passengers and the transportation of goods, there are adaptations of which it is capable which should—when fully understood—increase its popularity with manufacturing and commercial firms. So, at least, says the *American Motor World*, which points out that in every motor-vehicle we have a portable engine, whose power can be utilised for a large variety of work by simply providing a short length of flexible shafting which can be connected up to the engine shaft, or to one of the counter-shafts. Take the case of a builder or contractor engaged in the erection of a large building, and using a motor-truck for the transport of his materials. The truck might be fitted with a winding drum, and after it had been placed into a suitable position, a rope or chain from the lifting tackle might be led to the drum through a snatch block, and the power of the motor utilised not only to discharge the load, but also to hoist it up to the necessary elevation at once. For girders and other heavy goods the low speed would be used, and for quick, light lifts one of the higher gears. When not required for transport purposes, the motor, by means of a flexible shaft, might operate a circular saw on the site of the building, and thus save a large amount of hand labour.

Similar conditions obtain in many other cases. The farmer, for instance, frequently has to engage a portable engine for his work. The heavy motor-wagon would not only enable him to transport his produce to markets which were formerly inaccessible, but the motor itself could also be used for operating the various machines which are often worked by hand, or in a clumsy fashion by horses.

Turning now to pleasure vehicles, the well-equipped country house of the future will have its motor-vehicle for station work, and it is quite easy to conceive that a vehicle of the Daimler type, provided with a length of flexible shafting, might extend its field of usefulness very widely under such conditions. It might be used for pumping water from a well to an overhead tank for supplying the house, and also for operating a churn, chaff-cutter, and other similar machines. These few instances will serve to indicate some of the directions in which the usefulness of the motor-vehicle can be increased, and by a little careful thought the list might be largely amplified, and manufacturers will see that by the addition of simple attachments, the cost of which would be comparatively small, they might largely increase the selling power of their vehicles.

THE proposal to throw a bridge over the Medway at Snodland has been revived. The Kent County Council, the Rochester Bridge wardens and other authorities, are considering a scheme which would involve a cost of £15,000.

THE SERPOLLET SELF-STARTER.

REFERENCE has already been made in these columns to the improvements lately introduced by M. Serpollet in his well-known steam vehicles. One of the features of the system is that the feed-pump supplies water to the boiler in strict proportion to the work being done; the boiler only containing at any one time but a small quantity of water. Moreover, the safety automatic by-pass valve on the discharge pipe of the pump allows the water contained in the generator or feed pipe, and what may be pumped if the pump continues to operate, to return to the water tank whenever the consumption of steam is suddenly reduced or stopped altogether (a very frequent occurrence in the operation of an automobile), in order to prevent the generation of more steam than is needed.

The system has already been developed to work satisfactorily under this condition; but there were still these two objections, that when starting up again the hand pump has to be used to supply the boiler with sufficient water to get it into action, and that the automatic pump worked under maximum pressure when the water from it returned to the tank without producing any useful effect.

The new self-starting arrangement, illustrated diagrammatically herewith, does away with these objectionable features. It consists of a hollow cylinder containing a piston, one end of the cylinder communicating by a pipe with the feed-pipe of the boiler. This end of the cylinder is filled with water, and the opposite end with air compressed to a pressure corresponding to the boiler pressure (280 lbs. per square inch for example) when the piston is at its lowest point.

If now the work required of the engine (and consequently the feed) is reduced, the pressure in the boiler naturally rises, and as soon as it exceeds 280 lbs. per square inch it further compresses the air in the cylinder of the self-starter by forcing the piston back, and the space in the lower part of the cylinder moved through by the piston fills with water. This compression of the air in the upper part of the cylinder continues until its pressure becomes that to which the automatic by-pass valve is set (say 560 lbs. per square inch), which then operates as usual.

A volume of water nearly equal to one-half the capacity of the cylinder is thus stored up under a pressure of over 500 lbs. per square inch, and the moment the engine throttle is opened and the boiler pressure thus reduced, this water is forced into the boiler by the air pressure in the cylinder.

The latter is situated in such a position that is not affected by the boiler fire, and when the vehicle is stopped there is no increase of steam pressure. If the cylinder of the self-starter is made of sufficient capacity that a compression of the air to the limit above given admits to it practically all the water ordinarily contained in the boiler, then the automatic by-pass valve operates only rarely, since the boiler contains only a small amount of steam, which is superheated, without any serious increase in pressure. To restart after a stoppage, a small valve wheel on the dashboard is given a half-turn which allows the air pressure above the piston in the cylinder to force water into the boiler.

SIR HENRY THOMPSON, BART., has written a new book on the use and management of motor-cars.

THE MARIENFELDE 20-H.P. CAR.

OUR illustrations (Figs. 1 and 2) present respectively an elevation and plan of the *chassis* of the latest 20 h.p. petrol-car turned out from the works of the Motor-fabrzeug und Motorenfabrik Gesellschaft, of Marienfelde, Berlin. The motive power is supplied by a four-cylinder engine located in the fore part of the frame under a bonnet. The motor, which at its normal speed develops 20 h.p., can be run at 1,400 revolu-

tion wheels by chain gearing. Inclined wheel steering is fitted, while there is a pedal-operated band brake on the differential shaft and band brakes on drums connected with the hubs of the rear road wheels, the latter being put in action by means of a hand lever. The motor is fitted with a governor which acts on the admission and ignition simultaneously, there being also a hand accelerator fitted in connection therewith. The frame, which is constructed of wood and steel, is adapted to receive any type of carriage body. The road wheels are all the same size, while the noticeable feature of the car is its relatively long wheel base and

FIG. 1.—ELEVATION OF THE MARIENFELDE 20-H.P. CAR.

FIG. 2.—PLAN OF MARIENFELDE 20-H.P. CAR.

tions per minute, when it is said to give off 30-h.p. It is fitted with magneto-electric ignition. The Cannstatt-Daimler type of combined water-tank and cooler is adopted. The tank, which is fixed in the forward end of the frame, is pierced by a large number of small tubes, through which currents of air are induced by means of a fan driven by the engine.

Four speeds forward and a reverse motion are provided, these being controlled by a single lever at the side of the driver. The power of the engine is conveyed through a pedal-actuated friction clutch to the gear-box, which contains a train of sliding gears. The gear-box is connected by bevel pinions to the differential cross shaft, which in turn transmits the power to the rear

low centre of gravity. The complete *chassis* is stated to weigh just under 16cwt.

MOTOR-CARS and cycles will be included in a great Fair and Exhibition to be held at Leipsic from October 18th to the 27th of the present year.

It is reported that the German Daimler Motor Company at Cannstatt are making some experiments in connection with steam cars.

THE projected automobile tour of Holland has been abandoned, owing to the authorities forbidding a speed in excess of 20 kilometres (12½ miles) per hour.

HERE AND THERE.

MESSRS. CUDELL AND CO., of Aix-la-Chapelle, Germany, have lately completed a 35-h.p. racing car.

THE Automobile Garage, Limited, has been formed at Toronto, Ont., to open a motor-car *garage* in that city.

MESSRS. MARTIN AND CO., of Frauenfeld, Switzerland, have decided to establish large new works at St. Blaise (Canton of Neunburg), for the manufacture of heavy motor-vehicles.

MR. STEAD, the leading motorist in the Nice-La Turbie hill-climbing contest last week, averaged a speed of thirty-five miles an hour—and this in a dense fog!

THE annual subscription to the Irish Motor Cycling Union is £1 for members residing within twenty-five miles of Dublin, and 10s. for country members. No entrance fee will be charged for members joining before December 31st next.

THE Prime Minister of Annam, who is at present in Paris at the head of a mission from Indo-China, has become a convert to automobilism, and during a visit to the Clement works at Levallois last week ordered an 8-h.p. motor-car.

THE German Ministry of the Interior has approved the proposal of the Nuremburg district authorities to use a motor prison van to carry prisoners to and from the prison and railway station at Nuremburg. The vehicle is being built by the Union Motorfahrzeugfabrik of that city.

MR. ALEXANDER WINTON, the head of the Winton Motor-carriage Company, of Cleveland, U.S.A., is a great believer in automobile races. Apart from the advertisement the vehicle obtains, Mr. Winton considers that a man learns by racing his vehicle many useful points he can obtain in no other way.

MR. JOHN MALTBY, of High Street, Sandgate, is catering for the requirements of motorists in his district in a thorough manner. Not only is a stock of petrol, oils, and greases kept on hand, but he has a *garage* for about a dozen cars. He also undertakes repairs to cars of all types, and has lately added a body building and painting department.

A REPAIRING outfit that contains a plentiful supply of substantial materials necessary for the worst form of puncture or gash in motor cycles is that made by the Dunlop Tyre Company. It includes eight bevelled-edged patches, a tin of strong solution, a tin of French chalk, large rolls of prepared canvas, a rasp "file card," and substantial set of wooden tyre levers for refractory tyres.

PENDING the erection of their new *garage* in Wardour Street, W., the London Motor Garage Company, Limited, have taken the premises, 81, Page Street, Westminster, lately occupied by the Locomobile Company of America, and have opened them as a *garage* and repairing depot. Covering an area of 5,000 superficial feet, these extensive premises are well adapted for the storage of motor-cars; they have also the advantage of being on the ground floor, with a wide entrance leading into a large private courtyard in front of the main building. The managing director of the concern is Mr. Frank Atherley.

AT the last monthly meeting of the Aeronautical Institute and Club papers were read by Dr. Barton, of Beckenham, and Mr. P. L. Seneca. Dr. Barton said the prominent features of his new balloon were the three sets of triple aeroplanes. He explained that these would obviate the loss of gas and ballast; 970lb. lifting or depressing force could be exerted at will. The propelling arrangements consisted of six sets of double-bladed screws (the blades being further tripled one behind the other, venetian blind fashion), arranged three on each side in different planes. They are to be driven by three "Buchet" motors, each of 45 h.p., which it is estimated will drive the airship 25 miles per hour in a calm. Petrol will be carried for a 48 hours' run, and the balloon will be manned by a crew of five. The length of balloon will be 180ft., and the car 104ft. The latter is to be fitted with an automatic balancing device actuated by a pendulum.

THE Speedwell Motor and Engineering Company, of Reading, has now a London address at 50, Albert Gate, S.W.

THE South Wales Motor Company, 35, Westgate Street, Cardiff, have been appointed sole agents for "Argyll" cars for Glamorganshire and Monmouthshire. They have also been appointed official repairers to the Automobile Club.

MESSRS. STEINER AND CO., of 142, Houndsditch, E.C., have sent us a copy of their new catalogue, in which a number of pages are devoted to lamps, horns, and other motor-car and cycle accessories.

A NEW stand for motor-bicycles has just been put on the market by the Devonshire Cycle and Motor Company, of Brookhill, Sheffield. The stand is light, and, when not in use, can be folded into a very small compass.

REFERENCE was made in a recent issue to the large *garage* establishments that have sprung up in recent years in Paris and other parts of France. By the kindness of Mr. C. Friswell in furnishing us with the photographs, we are able to give herewith two illustrations showing the exterior and interior of one of these immense emporiums, viz., that of the Palais de l'Automobile et du Cycle at 218, Boulevard-Pereire, Paris. The *garage* is kept

open day and night, so that private motor-cars can be taken in and out at any time. Needless to say every provision is made for the cleaning and repair of cars and refilling with petrol and water, etc.

A NEW list of Pratt's motor spirit agents has been issued. This spirit can now be obtained at 1,410 places in London and the provinces, and it is indispensable to all motorists, who should write to the Anglo American Oil Company for the book. A copy of the Government regulations as to the storing of motor spirit is included.

A NUMBER of motor-cars will be seen on the cycle track at the "Gigas" Bazaar in Dublin on the 13th prox., and the three following days. Several large cars have been placed at the disposal of the committee, and the track will provide a suitable place for manoeuvres. Mr. W. R. D'Alton will have charge of the parades—a similar position to that he filled at the Dublin Spring Show of 1901. Although motor-cars have been shown this week at the Spring Show, there have been no parades, owing to the objections of exhibiting horse owners.

CORRESPONDENCE.

L'ALLUMEUR ELECTRO-CATALYTIQUE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in your account of the above, in your issue of March 22nd. I have a motor with lamp ignition which is awkward in a wind, and I do not wish to go to the expense of electric ignition; so it struck me that M. Wydt's ignition block would do what I wanted. Where can one be procured?

I think I have seen a gas lighter on this principle. The lighter consisted of a brass handle and what I took to be a coil of fine platinum wire. The gas tap was turned on and the coil, being held over the burner, became incandescent, so igniting the gas.—Yours truly,

CHAIN.

HOW TO SELECT A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Perplexed's" letter, in the *Journal* of the 12th inst., enquiring about a car suitable for the hilly country of South Devon, I should like to call his attention to a car built by Messrs. J. Parr and Company, of Leicester, which I fancy would meet his requirements in every way. I have watched the construction of this vehicle from beginning to finish, and can say, with perfect truthfulness, that it is thoroughly well and strongly made under the supervision of a competent engineer. It is very simple and very easily managed, and is, in my opinion, absolutely fool-proof. There are two forward speeds and one reverse. The drive is obtained by two chains from engine to counter-shaft, the change speed by means of expanding clutches which engage with either the low or high speed chain wheels by moving a lever on the right of the driver. When the lever is in a central position the engine runs free; the reversing gear is actuated by a pedal and is a very ingenious friction arrangement. It will be seen that there are no cogwheels, thus no broken teeth. The speed can be arranged to meet the requirements of the district. I have driven this car and find its running very smooth and noiseless. It has a long wheel base (5ft. 10 $\frac{1}{2}$ in.) and a roomy tonneau, and the price is well within that mentioned by "Perplexed." I may say the engine develops full 8-h.p. at 1,400 revolutions. I have no interest in this firm whatever, beyond the fact that I have had several jobs carried out at their works most satisfactorily, but being an enthusiast in the pastime I take every opportunity of gaining information in reference to the details of construction of motor-vehicles with particular regard to strength and reliability.—Yours faithfully,

L. L. POWELL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Perplexed" will let me know his address, I will tell him of a large English firm who will be most pleased to give him a ten mile run or even more. The car is fitted with a good engine, as I know from experience, three speeds forward and reverse, the arrangement is on Panhard lines in every particular, and the price is exactly the one named by "Perplexed." The car will, I should think, accomplish all "Perplexed" requires.—Yours truly,

SLATTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter of "Perplexed" is just one of those that are so difficult to answer definitely, because there are so many limiting conditions; but, knowing Devonshire, and having done a certain amount of motoring in it, I am aware of some of the conditions referred to. At the price named only light vehicles of the "Voiturette" class need be considered, and I do not myself think that for Devonshire any of those are sufficiently strongly built to withstand the strains to which the steep, and often rough, roads subject their frames and machinery.

There are cars, such as those made by the Daimler Company, the "Gladiator," etc., which would get up such hills as "Perplexed" refers to, and I suppose even a small powered "Benz" would do the same if fitted with Crypto gear, and with the belt thoroughly tight. But all these would come under the designation of "Voiturettes," or lightly-constructed cars. To struggle up and down the hills (and the getting down is no easy matter sometimes), a good strong engine in a good strong frame is really needed, and that means about twice the price named as the limit. For the same nominal h.p., too, the two-cylinder engines appear more effective than the single-cylinder ones, but their cost is higher.—Yours truly,

HILL CLIMBER.

A WARNING FROM ESSEX.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For the information of motorists using the main Eastern Counties road, I may here state that at Romford, Brentwood, Ingatestone, and Widford by Chelmsford, the police and telephone work in sympathy, and woe betide any driver using his top speed. The stages are as nearly as possible six miles apart, so if half an hour is allowed for each stage it will give the occupants of the car time to view some of the best landscapes in Essex, and possibly save the owner's pocket considerably. Beyond Chelmsford, and right away for 100 miles, there are no telephones, and police are very scarce.

In conversation with several of the county constabulary, who appear to be an intelligent body of men and mostly good sportsmen, they tell me they have no animosity towards motor-cars or their drivers, and the duty of trapping is loathsome to them; but they are "acting under orders," and these orders never would have been given but for the reckless driving of some, and the total disregard by many of the hand held up by magistrates and their friends of the landed gentry, who, when driving, were frequently more nervous than their animals.—Yours truly,

EDWIN S. CHEEL.

SPRING CLEANING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Allow me a few remarks re your "Spring Cleaning" article. Admitting that some or all of the therein-mentioned faults are to be repaired (or perhaps only investigation may be required), then, how and by whom are they to be done? My experience of the regular people in this line is such that I prefer not to trouble them again, since for the repair of a small leakage in my petrol-tank I have had to pay 25s., and in another instance was refused a man to help me because I was not a customer. I prefer very much to get the workpeople home in my own stable, but where are they to be found? If we could get to know of one or more handy and willing young men who understood their work and would help owners at a reasonable charge to overhaul their cars and to do repairs, I am sure many owners, who are not millionaires, would be very thankful.—Yours truly,

E. L. S.

MOTOR BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My first experience with a motor-bicycle was not at all satisfactory, the machine I purchased turning out to be absolutely worthless. The workmanship was very poor, the noise unendurable, and the parts were assembled in a very primitive way. Later on I bought another make, which is perhaps as perfect a machine as can be made at the present time, the workmanship, material, and adjustments being all first-class. I have not used it in my practice for the reason that the distances between calls are so short that it is more trouble than a bicycle. I use the machine for pleasure riding only. I have never had an accident with it beyond an ordinary puncture of the tyre; I have never fallen from it or run into anything, and never was injured nor injured anyone else. The machine steers easier than an ordinary bicycle, and one experiences a feeling of solidity, due to the extra weight, which is not noticed on the bicycle. After riding the motor-bicycle for a while and then riding the bicycle you feel as though you are getting on a very flimsy and frail machine, and if it were not for past experience you might even hesitate to ride it.

One serious drawback to a motor-cycle is that one cannot wear good clothing while riding it. In spite of the best care and attention the motor will spill oil, and you will get covered with dust. When I go out I put on my motoring-suit, and then look as greasy as an engine attendant, and when I get back I have quite a job cleaning off the dust both from clothing and machine.

I have not had many sparking troubles, and what few I did have were always easily located. All you have to do is to follow the wiring; if it is intact, test your battery; if the battery is strong enough, clean the contact points; and if all these parts are in perfect condition and you still get no spark, unscrew the sparking plug and clean off the carbon. Having done that, you must get results. As to skidding or side-slipping, I do not find the motor-bicycles any worse than ordinary cycles; in fact, if anything, I think they are rather the more sure-footed of the two. Still, you cannot go round a street corner at a twenty-mile rate, the motor-bicycle requiring as much care and consideration on slippery tramway rails or in rounding corners as a bicycle.—Yours truly,

DOCTOR.

COST OF MAINTENANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think "M. B." must have made some mistake in his estimate as regards the amount put down for petrol, viz., £10 10s. for 3,000 miles. I have driven a steam car since October for commercial travelling. Having run 2,500 miles, I find the consumption of petrol is exactly 1 $\frac{1}{2}$ d. per mile. Of course "M. B." may purchase his spirit at a special rate. I have to get mine as I go on my journeys, and pay anything between 11d. and 1s. 6d. per gallon. Otherwise, I think his estimates fairly correct. I can certainly endorse his last remarks upon the satisfactory running of steam cars and also upon their simplicity. I am no mechanic, but after three hours' instruction my car was handed over to me and I have had sole control since and had no trouble. I have just had the engine thoroughly overhauled for the first time, for which I was charged 20s. This included two new slides. A local man did it.—Yours sincerely,

NOSILLA.

MECHANICAL FLIGHT UP-TO-DATE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will Mr. Sydney Hollands please oblige by giving a description of the variable stroke pump for boiler feed mentioned by him in the *Journal* a few weeks ago? How is it automatically worked, and is there any patent connected with it?—Yours truly,

NEW READER.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. G. H. Smith's letter in last week's issue of the *Motor-Car Journal*, I have only to state that Mr. Smith is the only person who has ever been refused admission to this Association.—Yours truly,

GEO. R. HELMORE,
Secretary.

The Automobile Mutual Protection Association, Limited.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I enclose for publication copy of a letter, dated April 3rd, received by me from the secretary of the Automobile Club, together with copy of my reply on behalf of this Association.—Yours faithfully,

GEO. R. HELMORE, Secretary.

[COPY.]

The Automobile Club, 4, Whitehall Court,
London, S.W., April 3rd, 1902.

Dear Sir,—I beg to enclose herewith a copy of the current issue of "Notes and Notices," and to draw your attention to the paragraph headed "Automobile Mutual Protection Association," which appears on page 111. I am directed to express the hope that you may see your way to call a fully representative meeting of the Association to consider the resolutions of your Association, which are set out on page 106 of the same issue of "Notes and Notices," and that the Club may be afforded some explanation of the meaning of the assertions contained in the resolution—"That the Club has acted in the interests of a few, and its proposal to form an exhibition association is inimical to the interests of the industry."—Yours faithfully,

—(Signed) C. JOHNSON, Secretary.

G. R. Helmore, Esq.

[COPY.]

The Automobile Mutual Protection Association, Limited,
Jessel Chambers, 88, Chancery Lane, London, W.C.

April 15th, 1902.

Dear Sir,—In your letter of the 3rd inst., you ask that the Club may be afforded some explanation of the following resolution passed at a meeting of the Committee of this Association on March 18th last, namely:—

"That the action of the Automobile Club in handling trade questions, often in the interests of a few, and in its proposal to form an exhibition association, is inimical to the interests of the industry as a whole and to the aims and objects of this Association which is the recognised Trade Protection Society."

I would state at the outset that this Association has been desirous throughout its existence of maintaining friendly relations with the Automobile Club, and believes that it is in the interests of the industry that the two bodies should work in harmony. The suggestion which has been made in certain quarters that the Association is hostile to the Club is as unfair as it is unfounded in fact. That the Club has permitted on occasions a section of its members engaged in the industry to handle trade questions in the interests of a few is the firm conviction of the Committee of this Association, and one instance will suffice to support the assertion. On June 11th, 1901, the following resolutions in regard to the exhibition question were passed:—

"That there shall be only one exhibition per annum; that it shall be under the same management as the recent exhibition; that it shall be at the Agricultural Hall at the same time approximately as the recent exhibition, and under the control of the Automobile Club."

"That a circular letter be issued by the Automobile Club to manufacturers and agents, enclosing a printed letter to be signed by each individual firm or agent, declaring that they will not exhibit at any exhibition in London or within twenty miles of Charing Cross which is not recognised by the Automobile Club. This agreement to hold good until the end of 1903. The exhibition space of the Automobile Club Exhibition to be open only to those who sign the agreement above named."

"That the Automobile Club of Great Britain and Ireland shall have the right to refuse space at their exhibition to all who have exhibited automobiles or their parts at any exhibition within twenty miles of Charing Cross which is not recognised by the Automobile Club."

The large majority of the members of this Association was loyal to the provisions of these resolutions, and it was a matter of astonishment and regret to them that those who were disloyal and had exhibited at the show held at the Crystal Palace were allowed to attend and vote at a subsequent meeting of manufacturers and agents, convened by the Club to deal with the question of the date on which the annual exhibition should be held, when resolutions were passed, which were put forward by those to whose presence exception is taken, which over-ruled the decisions come to at the earlier meeting. When it is remembered that this state of things was brought about by those who comprise, to a great extent, the members of a group which all along has been in opposition to this Association, chiefly in respect of the claim which they set up to a monopoly of the Maybach carburettor, which, but for the action taken by this Association, at very great expense to its members, would have practically strangled the motor industry in this country, it will be appreciated that the members of this Association had a very real cause of grievance in the matter.

Passing to another subject, my Committee consider it was unfriendly on the part of those responsible for the drafting of the circular letter of

March 12th, 1902, issued and sent by the Club to the members of this Association, to suggest the formation of a rival association to deal with a question which comes within the scope of the objects for which this particular Association was formed.

In conclusion, I am instructed to express the regret of the Committee that the Chairman of the Automobile Club—who was chairman of the meeting of manufacturers and sellers, held at the Club on March 20th—when referring to the resolution passed by this Association above referred to professed ignorance of this Association and of its Committee. The fact is the more extraordinary, seeing that the gentleman in question was chairman of the meeting held at the Automobile Club when the formation of this Association was decided upon, and that he acted as counsel in the action, the British Motor Traction Company, Limited, v. Friwell, which he well knew was being supported by and defended at the expense of this Association. The Association has been in existence little longer than twelve months, but during that time has, without any flourish of trumpets, done a large amount of solid work in the interests of the trade, and has borne the expense of grappling with and crushing the greatest danger the trade has ever been confronted with. With the exception of the group of persons who were in opposition to it in respect of the Maybach carburettor action, the name of practically every well-known manufacturer and agent throughout the country is on the register of members of this Association.

Yours faithfully,

(Signed) GEO. R. HELMORE, Secretary.

P.S.—I am sending a copy of the correspondence between us to the trade journals.—G. R. H.

C. Johnson, Esq., The Automobile Club,
4, Whitehall Court, S.W.

FURIOUS DRIVING CASES.

At the Shire Hall, Nottingham, Robert Cripps, cycle maker, of Nottingham, was charged with driving a motor-car above twelve miles an hour, and at a greater speed than was reasonable, on March 23rd. Mr. A. Barlow prosecuted on behalf of the police, and Mr. C. E. W. Lucas, who defended, pleaded not guilty. Mr. Barlow said the police were bound to bring the facts to the knowledge of the Bench, and when they heard the rate of speed at which this car was driven he thought they would agree that the defendant was guilty of a serious offence. Mr. Cripps was, on March 23rd, driving his motor-car through the village of Gotham, about twelve o'clock, and at a speed of from sixteen to eighteen miles. At that time the people were coming out of church, and they were scattered in all directions. The next that was seen of the car was on the Ridgeway hill, going towards East Leake. Four cyclists were going down this hill as the defendant's car came down, and they would say that the car came towards them at a great rate of speed, swaying about from side to side. The cyclists got as far towards the left side of the road as possible, and the car passed them all safely except the last, whose cycle wheels were in a rut. Unfortunately for him, just as the car passed, his front wheel skidded and caused it to turn in towards the roadway, which at that point was 16 feet wide. The car came full smash into the front wheel of the cycle, and they could imagine what happened. The cyclist was knocked off to a distance of three or four yards, and his arm was rather badly hurt. Directly the impact took place the car turned on to its side and then went over, the occupants being thrown out. Henry Talbot, a miner, of Gotham, deposed to seeing a motor-car proceed through that village about 12 o'clock on the Sunday morning named, at a rate of sixteen or eighteen miles an hour. Edward Meakin, of Gotham, who corroborated, put the pace at from sixteen to twenty miles an hour. William Powdrill, miner, gave similar evidence. James Bowley, of Nottingham, stated that he was cycling from East Leake to Gotham, with three friends. Witness bore out Mr. Barlow's statement as to the car colliding with his machine and knocking him off, and identified Mr. Cripps as the person who was driving the car. There were four others in the car. Witness admitted that defendant asked him for his name and address immediately after the accident. E. A. Simpson added that the rate of speed of the car when coming down the hill was sixteen miles an hour.

After much evidence for the prosecution, Mr. Lucas, for the defence, observed that, appearing as he did for the Nottingham Automobile Club, he would say at once that they were obliged to the police for the consideration which they extended to automobilists. There was, to a certain extent, a prejudice against automobilists, just as there used to be against cyclists, and it was customary to assume that in the case of any accident the fault was due to the automobilist. In this case the accident was entirely the fault of the cyclist, who was riding in a careless and negligent manner. When the defendant got to the top of the hill he stopped there and took some photographs. While there six cyclists (who would be called to give evidence) passed him going in the same direction, at the rate of eight or nine miles an hour. Immediately after the cyclists had passed, defendant started again. From the top of the hill to where the accident happened was a distance of 400 yards, and had the defendant been riding at the pace stated he must have overtaken the cyclists at once, whereas they had gone 200 yards past the on-coming cyclists before the collision took place. One of the six cyclists, who were all strangers to Mr. Cripps, noticed Bowley (the cyclist) wobbling about the road, and had to use the greatest caution to get past him. When the car approached, Bowley got his wheel into a

rut, and this bringing the other wheel round in front of the car, the latter toppled over. The other party of cyclists returned, and agreed that the "near" side of the car was as close to the grass as it was possible to be. Mr. Lucas pointed out that the car had cost Mr. Cripps £350, and the damage caused by the accident amounted to £15. Defendant, who was a careful and experienced driver, had never had any similar complaint made against him. Defendant went into the witness-box, and substantiated his solicitor's statement. He denied that he was travelling at more than eight miles an hour, and put the fault of the accident on Bowley. In answer to Mr. Barlow, defendant asserted that it was impossible for this car to go more than fifteen or sixteen miles an hour. If Mr. Barlow could get more than that out of it, he would give it to him. The six cyclists having given evidence, the Bench were of opinion that the speed of the car was not excessive, and dismissed the case. The hearing occupied 3½ hours.

GEORFREY CHESTON, London, was summoned at Brighton last week for driving a light locomotive at a greater speed than was necessary on the Marine Parade, on March 23rd. Police-constable William E. Smith said that on Sunday afternoon, March 23rd, he saw defendant driving a motor-car eastward. It was travelling at fourteen or sixteen miles an hour, and, having regard to the traffic on the Marine Parade at the time, the pace was a dangerous one. Fined 40s. and costs.

AT Brownhills, Birmingham, Ashley Brown, chemist, Chasetown, has been fined £1 12s. 6d. for driving a motor-cycle at more than twelve miles an hour at Burntwood on Good Friday. It was stated that at a dangerous spot he covered 600 yards in sixty-eight seconds—at a rate of over eighteen miles an hour. The defendant asserted that the officer was a bad judge, as he was not exceeding the limit.

JAMES HENRY WICKENS, Finborough Road, Kensington, was charged before Mr. Rose, at the West London Police-court, with furiously driving a motor-car. The attention of several constables was called to the prisoner, who was seen driving the car in Redcliffe Gardens at a terrific pace. According to the evidence of one officer, he had never seen a car driven at such a speed. Another officer stated that the speed was at the rate of fifteen to twenty miles an hour. The prisoner said the car could not go at a greater speed than fifteen miles an hour. Mr. Rose: That is rather fast in the streets of London. The constable in the case said the prisoner's employer told him that the car could travel twenty miles an hour, if not faster. Mr. Rose said a motor-car was a dangerous vehicle to be driven at that speed, and imposed a penalty of 20s.

LAST week we briefly recorded a case in which A. F. Mortimer, of Worthing, was fined at the Shoreham Petty Sessions for driving a car at an improper speed. The police evidence was to the effect that the car was travelling at the rate of seventeen or twenty miles an hour. The defendant said he had driven motor-cars for three and a half years and had never been stopped before. The passengers on the car said the speed of the car was not more than ten miles an hour, but that did not prevent a fine of £3 and 23s. costs.

HENRY LAVAGET was summoned at the Hull Police-court for furiously driving his motor-car in George Street on the 22nd March. The magistrate said there had been a technical breach of the Act, and, as there were certain points in the defendant's favour, judgment would be respite on payment of costs.

FRANK DENNIS, of Kirton, was summoned at the North Holland Petty Sessions for driving a motor-car at Sutterton at a greater rate of speed than 14 miles an hour on March 31st. A "publican and cottager" gave evidence that he saw Dennis driving his motor-car at the rate of twenty-five miles an hour. For the defence it was stated that the car was a voiturette, the top speed of which was eighteen miles an hour. On the previous Saturday it had been taken to a firm at Boston to be overhauled, and when he called for it on the day of the alleged offence all the necessary repairs had not been executed, and the batteries had not been recharged and replaced by others. Consequently, it was impossible for it to run more than twelve miles an hour. After corroborative expert evidence, the case was dismissed.

MAX CRANDEN has been summoned at the Croydon Police-court for driving a motor-car to the common danger of the public in Brighton Road. Fined 10s. and 5s. 6d. costs.

At the King's House, Lyndhurst, Harold Rolls, of Holdenhurst Road, Bournemouth, has been fined 5s. and 12s. costs, for driving a motor-car in the highway at more than fourteen miles an hour.

On Saturday, at the Bettws-y-Coed Police-court, Mr. E. W. Rowcliffe, 37, Cross Street, Manchester, president of the Manchester Automobile Club, was summoned for furiously driving a motor-vehicle between Trefriw and Conway on March 12th. Defendant was represented by Mr. David Jones, Llanrwst, and pleaded not guilty. Superintendent Rees, of Conway, called three witnesses, and it was alleged that the defendant drove the motor from twenty to twenty-five miles an hour. Defendant, who gave evidence, said he had always taken particular care in regard to speed, and he gave it as his undoubted opinion that he never exceeded ten or eleven miles an hour. Mr. Percy Higson, accountant, Spring Gardens, Manchester, who rode with the defendant, gave corroborative evidence. After a hearing of nearly two hours' duration the bench imposed a fine of £2 and costs.

WALTER JAMES CANN has been fined £3, with 16s. costs, at Folkestone for driving a motor-car down Sandgate Hill at the rate of twelve or fourteen miles an hour.

A WELL-KNOWN motorist named William A. Booth, of Walkden, was summoned for riding a motor-tricycle on the footpath at Little Hulton near Bolton on March 26th. When stopped he said that it was on account

of the road being rough that he was on the footpath. A fine of 10s. was imposed.

EDWARD MANVILLE has appeared at the Worthing Petty Sessions, to a summons charging him with having driven a motor-car above the regulation speed of twelve miles an hour, at Broadwater, on Sunday, the 16th ult. P.C. Payne said the defendant covered a measured quarter of a mile along Broadwater Green in 38 sec., or at a speed of twenty-three miles an hour. A fine of 20s. including costs was imposed.

At the Northampton Borough Petty Sessions, James Cason, motor engineer, Redfield, Winslow, was summoned for driving a light locomotive along Bridge Street at a greater speed than was reasonable and proper, on Thursday, the 27th ult. Defendant, on oath, stated that he had driven motor-cars for five and a-half years, and for the last twelve months he had driven for Captain Lambton, of the Coldstream Guards, whose car he was driving in Bridge Street. The magistrates did not regard the case as serious, and inflicted a fine of £1 including costs.

THE Hon. John Scott-Montagu, M.P., was summoned at Winchester, on Saturday, for having driven his motor-car at a greater speed than twelve miles an hour. On Good Friday afternoon Mr. Scott-Montagu was driving his car from London to his residence at Beaulieu, in the New Forest. Two constables in plain clothes had been instructed to spend Good Friday on that particular spot for the purpose of stopping motor-cars which they suspected of going more than twelve miles an hour. They marked off 400 yards on the road, and then, standing together at the end of the measured stretch, they watched for motorists coming from London. They had no one to signal to them when a car entered on the measured stretch, nearly a quarter of a mile away, but trusted to their eyesight. Then one of them timed the car with an ordinary watch with a second hand. Constable Deason testified that Mr. Scott-Montagu covered the 400 yards in 23 sec. Mr. Scott-Montagu, giving evidence on his own behalf, said that, knowing that road particularly well, he had the brake on, because he was aware that it was dangerous to go through the village at a high speed. He thought the constable's estimate of twenty-five miles an hour was very excessive. He had the car under perfect control, and had purposely slowed up before the constable held up his hand. Mr. Staplee Firth pointed out that there was no suggestion that Mr. Montagu had driven furiously or endangered life. It was merely said that he had gone more than twelve miles an hour. The chairman said while the law remained what it was they were bound to convict, and inflicted a fine of £5 and costs.

A THIRD TRIAL.

At Marylebone County Court on Monday, before Judge Stonor and a jury, Mr. Emmanuel George Holt, cab driver, 22, Munroe Mews, Golborn Road, North Kensington, brought an action against Mr. F. Frentzel, 20, Prince of Wales Road, Battersea, S.W., and also against Dr. E. Lehweß, 66, Holland Park Avenue, Notting Hill, W., the claim being for £50, in respect of personal injuries said to have been caused through the negligent and unskillful driving of a motor-car by the defendants or their servants. There had been two previous trials of the case. On the first occasion the jury were unable to agree to a verdict, and at a new trial which followed the jury returned a verdict in favour of the plaintiff against Dr. Lehweß, considering that he was driving the motor-car at the time of the accident in question. The Judge described this as "a very bad verdict," and at once gave another new trial. Mr. S. W. Lambert now appeared for the plaintiff, and Mr. Staplee Firth represented both of the defendants. After a long hearing the jury found (1) that the driver of the motor-car was guilty of negligence causing the accident; (2) that the car was driven by Mr. Frentzel, and they assessed the damages in the plaintiff's favour at £25. His Honour gave judgment in favour of the plaintiff against the defendant Frentzel, and in favour of the defendant Lehweß against the plaintiff, with costs accordingly. Solicitor for the defendant asked that the order might be for the money to be paid into Court within twenty-one days, so as to allow an opportunity for lodging an appeal on the ground that there was no affirmative evidence of negligence against Frentzel to go to the jury.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, APRIL 26, 1902.

[No. 164.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THIS week we commence our report of the great Exhibition at the Agricultural Hall, London, which closes to-day (Saturday). It is our intention to deal exhaustively with the many new features which have been introduced into automobiles and also the novelties which are shown for the first time. The next few issues of the *Journal* will therefore constitute a complete survey of the present position of the industry, and

will serve as a permanent record of an Exhibition which has given a prestige and importance to the motor-car trade which cannot fail to act beneficially to all interested in its progress. The first instalment of our report contains full illustrative descriptions of several steam vehicles which are shown, as well as of a petrol car, which proves that Scotland is taking its place in the industry. The series of detail drawings of new cars will be continued next week.

Scotland v. France.

DR. LEHWISS will not be alone in his tour round the world, for the Chairman of the Hozier Engineering Company has expressed his willingness to run an 8-h.p. Argyll car against "Le Passe Partout"—a challenge which has been accepted.

The final arrangements were completed on Wednesday afternoon at the Agricultural Hall, and considerable interest will be felt with the result of this unique competition. The French vehicle is of 20 h.p., so that the challenge on behalf of the 8 h.p. Scotch car is all the more noteworthy. This will be the first time there has been a contest of this international and severe character, and British makers will wish success to the Hozier Company in their gallant effort to demonstrate the progress that has been made in the automobile industry in this country.

The King in Norfolk.

WHILE the King's new car, an illustration of which is given on page 156, is attracting the attention of the Press and the public at the Exhibition at the Agricultural Hall, His Majesty has been enjoying the delights of motoring at his Norfolk home. On the opening day of the Exhibition he took a long run in his motor-car, travelling as far as Cromer, where Princess Victoria has been staying since the recent speed trials at Gunton Park. Thus the King is experiencing the social delights of automobilism, by which it is possible for people in the country to maintain a round of social visits while enjoying the pleasures of the open air and learning more of the beauties and delights of the English landscape. The King's day in

Norfolk last Saturday is one example; the busy round of pleasure indulged in by the Earl of Shewsbury, which we chronicled last week, is another.

A Lecture on Motor-Cars.

THE motor-car was the subject of the Friday evening discourse at the Royal Institution last week, when the Rt. Hon. Sir John H. A. Macdonald was the lecturer. The Duke of Northumberland was in the chair, and introduced the Lord Justice Clerk of Scotland. In the course of his lecture Sir John reminded his audience that motor-driving on roads was no new thing, but such vehicles were opposed by various persons, and ultimately crushed out of existence, except so far as traction-engines were concerned. The lecturer told how a change in this state of affairs had been compelled by the invention of the spirit-driven engine, and he went on to explain the working of that engine and the mechanism by which it was applied to propel a vehicle along a road. He then gave a glowing account of the advantages to be derived from motor-cars by various members of the community—the business man would have inaccessible country districts opened out for residence, the farmer would be able to bring his goods to market irrespective of the middleman and the railway companies, the tradesman's range of delivery would be trebled, the innkeepers would no longer be a faded and decayed race when traffic was restored to the roads, the doctor's capacity for making his rounds would be increased, congestion in the streets of our towns would be lessened, and pollution by deleterious matter avoided. Finally, he besought his audience not to refuse to realise that the advent of motor-traction was to be looked on in a broad and unbiased spirit. It might have its drawbacks, like everything else, but the advantages it promised were so much greater that it was the duty of every good citizen to give it a fair and free field.

Lincolnshire Automobile Club.

A SUCCESSFUL run was held by the members of the Lincolnshire Club on Saturday to Folkingham. Thirteen cars took part in the spin, and their arrival at the Greyhound Hotel was witnessed by an interested gathering of spectators. The weather was fine, and the roads in splendid condition. The following took part in the outing:—Mr. Geo. Godson, Asgarby (Daimler); Mr. C. W. Pennell, Lincoln (Panhard); Dr. Gilpin, Bourne (Peugeot); Mr. W. B. Jevons, Market Rasen (De Dion); Mr. A. Padley, Market Rasen (De Dion); Captain Cole, Roxholm (Daimler); Dr. Cragg, Billingborough (Benz); Dr. Nicholl, Billinghway (Wolseley); Mr. W. R. Pennell, Lincoln (De Dion quad.); Mr. C. Nelson, Lincoln (De Dion); Mr. C. J. Parker, Grantham (De Dion); and Dr. Hancock-Steil, Colsterworth (Wolseley). The next run will be to Brigg on May 24th.

Trial Trips.

REFERENCES have lately been made by several correspondents to the refusal of trial trips by makers and agents. As Sir Roger de Coverley observed, "There is much to be said on both sides."

We know one member of the trade who recently took a military man for an afternoon's "trial trip" to the Crystal Palace, spending much time in negotiating hills and turning corners in the Sydenham and Penge district. The intending buyer then wrote and said he did not intend to become a motorist this season, but possibly might own a car next year. If such cases of "trials" were isolated the matter might cause a smile, but they are fairly common, and while sellers should give every facility for the investigation of the qualities of cars, they should be protected from the vagaries of the numerous class of persons who like free rides, with, if possible, a cup of tea thrown in.

A Suggested Remedy.

OF course each firm will get over the difficulty in its own way, but one suggestion which occurs to us in connection with this matter is that agents and sellers should make a charge for trial trips, just sufficient to cover running cost, driver's time, etc., such sum to be deducted from the account if the passenger purchases a car. In this way no injustice would be done either party; while the waste of time that now results from the overwhelming impudence of people who profess to be on the look-out for a good car, when all they want is a free ride, would be checked. Some people make a practice of visiting all the London firms in turn, asking for trial trips; on the other hand, there are scores of people interested in the subject who hardly care to ask a maker to allow them a trip, as they regard it as an obligation to purchase. By making a small charge for trial trips, and adhering to such a custom, the trade would probably save time and gain customers. Possibly some will think the matter of sufficient importance for further ventilation in our columns, and we shall be glad to hear from such readers—after the Exhibition is over.

MR. ALFRED HARMSWORTH'S 40 H.P. MERCEDES SIMPLEX CAR AT THE EXHIBITION.

Garages.

THE present year has seen the establishment of many garages in various parts of the country, and many others are in contemplation. Certainly there is room in every large town and at every seaside and holiday resort for one or two such places where cars can be suitably housed and cleaned. It is not merely enough to have premises to protect the car from bad

weather, but the establishment should have a good floor surface, while the proprietor should have a skilled mechanic or two to do any necessary repairs, and also efficient men to clean the car before it is taken out again. Of course, popular garages should be on the main road or in good and accessible positions. On Tuesday Sir E. Jenkinson formally opened the City garage in London, the Earl of Norbury being also present. An auction sale of cars followed, excellent prices being realised.

The Chicago Show.

SEVERAL leading makers of automobiles in the United States have been expressing themselves with regard to the results of the recent exhibition at Chicago. Mr. D. E. Rianard, of the Overman Automobile Company, says that a spring show is preferable to one in the winter or autumn, and regards April as the best month for such a display. Mr. Elwood Haynes declares that a spring show generally results in better sales than one held later in the year. There is no doubt that many buyers reserve their purchases till late in the spring, so as to be ready for the summer. They do not care to buy a car in the winter or in a season of variable bad weather; hence the popularity of the months of March and April for motor-car exhibitions, as the Agricultural Hall display has proved, and as has been so recently demonstrated in America.

Bexhill at Whitsun.

BEXHILL is evidently preparing to give the Automobile Club a grand reception on the occasion of its Whitsuntide visit. Earl De la Warr is taking a keen personal interest in the arrangements, and is making every endeavour to secure a successful series of speed trials. These will start from the top of Galley Hill, and will finish somewhere near the gates at the bottom of Sea Road. There will not only be a large attendance of British automobilists, but several French, Belgian, and German visitors have already booked rooms, so keen is the desire to see the performances of English and other cars. The list of presentation cups which will be competed for is steadily growing, and further particulars will be given in a later issue. Among the supplementary attractions at Bexhill during Whitsun, Earl De la Warr promises a grand Automobile Pink Domino Ball, at the Kursaal. Arrangements are being made for local visitors to see the motor-car sports, and altogether a large attendance of the public, as well as of motorists, is expected.

The Lanchester Car.

To celebrate the introduction of the Lanchester car to the public, the makers arranged for a run of nine of its vehicles from London to Worthing on Saturday last. The start was made from the Carlton Hotel, and after passing through Epsom and Dorking, tea was taken at Horsham. Shortly after leaving that quiet old town a downpour of rain occurred, and the successful journey was terminated at Warne's Hotel, at Worthing. Altogether the procession of cars made a notable sight, which attracted considerable attention along the line of route. Of the particular features of the Lanchester car there is no need to speak here, as they are being fully detailed in our report of the Exhibition now in progress at the Agricultural Hall.

Motor-Cars in Forfarshire.

AT the last meeting of the Forfar County Road Board Mr. Smith moved that the speed of motor-cars be considered. He said he had had a great many complaints of the speed at which motor-cars were run in the district. These were from the inhabitants of the county (four districts), from policemen, and others. One difficult matter was that they could hardly pass any restriction on the speed run on wide roads. At the same time, to run at a high rate of speed on narrow roads was ridiculous. At the last meeting of the County Council a representative from the Lochlee district complained of the treatment received on the Glenesk roads, which are very narrow and

dangerous. That gentleman had told the Council that the public had practically to disperse on the approach of a motor. The great difficulty was to identify the offending parties. He spoke of a case where a motor-car driver went from Forfar to Brechin in the space of thirty minutes. Reports were read from the four districts in regard to the matter, and it was unanimously agreed to report to the County Councils Association in favour of the registration of motor-cars.

Suffolk Roads.

MOTORISTS who have lately toured in Suffolk tell us that the representations which have made been during the past few years as to the wretched state of the roads there seem to have had little effect, and the surfaces of many of the main highways in that county are mediæval in their character. Why cannot the county authorities recognise their duty in the matter and see that the roads are well maintained? In Norfolk and the Fen country are some admirable roads, with the result that automobilists find pleasure in journeying through those districts, but the roads of Suffolk frighten motorists away, just as the police of Surrey have driven many whilom frequenters of the county to seek new pleasure ways.

Speed Estimates.

THE New Jersey Automobile Club has been holding a series of speed-guessing contests, the results of which have been quite as variable as the police evidence in a London police-court. Automobiles were driven at different speeds along a certain roadway, and keen observers attempted to gauge the rate. No one estimated the speed accurately—all were over the mark by from six to twelve miles—and not a single one under-estimated. As we have observed before, "Comment is needless."

Agriculturists and Motor-Cars.

We recently reported that an agricultural syndicate in France had offered a gold medal in a proposed competition for motor-vehicles in which alcohol provided the motive power. The enthusiasm of French agriculturists for motor-vehicles has now extended to England, and the Mid-Kent Agricultural Association proposes to offer a medal for the motor-vehicle best suited for the conveyance of agricultural produce, especially fruit. This will be regarded as satisfactory proof of the more enlightened attitude that agriculturists are taking in motor-vehicles, and we hope that the example of this Kentish association will be widely adopted. In fact, it might well be considered by the Royal Agricultural Society, whose possession of a permanent showyard may give them splendid opportunities for the necessary tests and trials.

Developments in the Bus Service.

THE suggestion was made by a northern correspondent a few weeks ago that something should be done to utilise the old tramcar and omnibus bodies belonging to municipalities that have abandoned horse traction in favour of electrical tramways. There is more in the idea than seems at first apparent, and we now learn that one of the great London bus companies is about to experiment with four-wheeled Tractors upon which the bodies of some of the existing buses will be placed, thus providing a self-propelled vehicle. The tractor, which will form the fore carriage of the vehicle, will be substituted for the two ordinary front wheels, so that the self-propelling bus will altogether have six wheels. There is no doubt we are on the eve of important developments with regard to the traffic of our large towns, and that the automobile in its various forms will play a powerful part in the changes that are imminent.

Economy and Prodigality.

It is to be feared that the progress of motoring as a fashionable pastime may have some incidental results not for the ultimate good of the industry, at least if its plutocratic votaries rush into print about their expenses. Were horses a novelty, the publication of the outlays on them by wealthy sportsmen would be quite enough to deter the professional man, say, of moderate means, from indulging in such a costly luxury. The idea that automobiles are necessarily costly is quite enough to frighten the lay public. The other day we heard the owner of two carriages and several horses lament that a car would be beyond his means, and found he was quite surprised on hearing the probable actual cost of a small car, which was all he aspired to. Needless to say the information left him a probable convert. It cannot be too often repeated that the cost of motoring is just what the motorist likes to make it. If it is worth his while to economise, he can run his car cheaper than any horse—if it is a good one; while if he is on speed intent, and likes to hand over all his troubles to a *mécanicien*, he can spend anything he likes. But it is the experiences of the former class that are most interesting and instructive, and which we invite in our columns.

THE FIRST RUN OF THE PORTSMOUTH CLUB—THE CARS AT CHICHESTER.

Furious Driving.

WE notice that two or three drivers of motor-cars have lately made a second or even third appearance in various courts, and have been fined for alleged furious driving. At a time when the representative associations connected with automobilism are striving to influence Parliament to remove the present vexatious regulations, it seems a pity that motorists do not ease their speed, or at least do something which may not thwart the movement now going on. There is no doubt that the feeling of members of the House of Commons is gradually veering round to the views frequently expressed in these columns by automobilists. Hence the necessity for drivers of motor-cars to be extremely careful, and do nothing that is calculated to prejudice public opinion against them.

Motoring in Switzerland.

BRITISH motorists touring in Switzerland will be interested in some information received by Mr. O. Herndorf from the secretary of the Swiss Automobile Club, 22, Rue de Hesse, Geneva. On passing the Swiss Customs a declaration of the gross weight of the car is necessary, and a tax of twenty francs per 100 kilogrammes has to be paid thereon. This, however, is returned on leaving Switzerland by any of the main

roads where there is a Customs station. No numbers are necessary for cars belonging to foreign motorists who are only passing through Switzerland, and, so far as certificates of driving efficiency are concerned, a photograph attached to the membership card of the A.C.G.B.I. will probably be found sufficient. The speed limit in Switzerland is thirty kilometres per hour in the country, and twelve kilometres in villages and towns. A useful pamphlet giving particulars of hotels and places where petrol may be obtained is issued by the Swiss Automobile Club.

An Automobile Congress.

AN automobile congress is to be held at Dijon, France, on June 6th, 7th, and 8th next. It is being organised by the Bourguignon Automobile Club, and already the support of the A.C.F. and all the leading French provincial clubs has been promised. Among the many papers to be read at the congress are the following:—"The Maintenance of Roads," by M. Forestier; "Railway Transport Rates for Motor-Cars," by M. Jeantaud; "Hotels," by Dr. Leon Petit; "Automobile Legislation," by M. Du Laurens de la Barre; "Motor-Car Mechanics," by M. Mirand-Devos; "Carriage Work of Touring Motor-Cars," by M. Auscher; and "Motor-Car Insurance," by M. H. Cottureau. In connection with the Congress a *fete* and a number of interesting excursions are being organised.

Cost of Maintenance.

THE correspondence in our columns on the cost of maintenance has attracted considerable attention, and we notice that motorists throughout the country have written to local journals quoting therefrom in advocacy of the claims of the motor-car. Mr. A. L. Creyke, of Oxford, has been in communication with the *Oxford Times* on the subject, and, besides securing extended publicity for motorists' experience, has added an interesting item of his own. He has a $3\frac{1}{2}$ -h.p. Renault car with which he can travel from twenty-five to thirty miles on one gallon of petrol, while half a gallon of lubricating oil lasts him 100 miles. He calculates the cost of running 100 miles to be about 5s. We shall be glad to have similar estimates—based on actual experience from other readers.

An Unnecessary Danger.

PERHAPS one of the first things that strikes the motorist on returning from the roads of northern France is the amount of unnecessary risk caused by the hedges bordering most of our English roads. Vehicles approaching a turning are almost invariably concealed from each other by these hedges. In this damp climate, roads are by no means benefited, except from a picturesque point of view, by a screening of high hedges; but though their total abolition would be regrettable, little difficulty would attend their partial removal or reduction at turnings where passing carriages would be otherwise hidden from view. To propose that all vehicles should carry a horn or other alarm, to be used when approaching corners, would be too common-sense a precaution ever to be adopted; but the interests of that rapid road traffic which will eventually prevail will have to be considered, sooner or later, in some such way as is here suggested.

Ordnance Survey Maps.

FROM the Board of Agriculture we learn that the Ordnance Survey have recently published a folding pocket map of Cromer and the surrounding district on the scale of one inch to the mile. The map is printed in colours on sheets 18 inches by 22 inches, mounted on canvas, in a neat cover, and is published at a moderate price. It is in outline with contours, the hill features

being printed in brown. Particularly useful for general topographical purposes, it should also prove serviceable to motorists, since it shows the roads, indicating their character and whether metalled or not, footpaths, hills, rivers, towns, villages, railway stations, and local boundaries. A similar map of London and the surrounding district on the scale of four miles to the inch has also been published by the Ordnance Survey. This is printed in black and white, the main roads being coloured. In issuing maps of counties and towns in this convenient form, useful service is being rendered to all who use the roads.

The Labourer and his Hire.

THE question of repairs and repairs is apt to be a somewhat vexed one, more especially with the increasing use of motor cars among those unversed in technical knowledge. Many of these have very little idea of the cost of good engineering work, and are (the more so, perhaps, from fearing consequent imposition) inclined to cavil at perfectly reasonable charges, from their former experience of the saddler and smith. On the other hand, the incompetent motor dealer may put in days of unnecessary work over locating a fault, and, even if the quality of the work done is unexceptionable, may charge a disproportionate sum in consequence. Some bad cases of this kind have recently come to our notice. A suggestion that has met with approval among some repairers is that they should agree to submit any case disputed by a car-owner to some unbiased and expert tribunal, and if such a suggestion was adopted by a representative body, it would no doubt be welcomed by both parties concerned. Hitherto, the owner has been pretty well able to take care of himself, but with the rapid multiplication of cars among all classes, this hardly continues to be the case, and some such arrangement, giving security against both the inefficient repairer and the unreasonable owner, could hardly fail to be beneficial.

One more enthusiast
Covered with dust,
Rushing impetuously
Onward he must.
Deal with him carefully,
Take not his name;
Had you a motor-car
You'd do the same.

Automobilism and Health.

RECENT references in the *Journal* as to the effect of motoring on health have occasioned much comment in other newspapers, and the subject is one on which motorists should be willing to enlighten the public. In the *Revue* of the Touring Club de France several members of that club give their experiences, and the letters from physicians are particularly interesting. One states that he has anticipated the benefits of automobilism by subjecting such patients as suffer from consumption, asthma, and bronchitis, and so forth, to a strong current of air, such as would be experienced in driving a car at the rate of 120 kilometres an hour. The patient first sits at some distance from the point of entrance of the hurricane, and gradually approaches till he can endure its full blast, much as one gradually acclimatises oneself to the successive temperatures in the rooms of a Turkish bath. By these means the physician claims to secure all the advantages of swift automobilism without the disadvantages of nervous strain (which he considers to undo much of the good otherwise attained) of policemen, and, no doubt, of dust and exposure to the chances of weather. The benefit experienced he attributes to the general stimulation of the organism by the oxygen thus forcibly inhaled, and to the expansion of the lungs necessitated by the violence of the air-current.

THE Motor-Car Exhibition at the Agricultural Hall.

Photo by]

A VIEW OF THE GREAT HALL FROM THE GALLERY.

[Argent Archer.

ENGLAND has, at last, been able to hold a great motor-car Exhibition fully worthy of the new industry, and one which will take high rank even among the chief Continental displays of automobiles. Since 1896 the motor-car exhibitions at the Agricultural Hall have been growing in size and importance, until from a meagre collection of horseless vehicles the display has grown to one of great dimensions, the exhibits overflowing from the ground floor of the spacious hall to the Minor Hall and into the Gallery—in each of which sections of the Exhibition are staged exhibits of interest and importance to all who are following the progress of the industry.

The Exhibition has been the "talk of the trade" for some weeks, and although none had prognosticated a falling-off of interest, few—unacquainted with the organisation—had ventured to credit such an advance as was revealed to those who sought admission early on Saturday morning. Quietly and without any formal declaration or preliminary ceremonial the Exhibition was opened to the public, and all day a steady stream of visitors testified to the general popularity of this annual event. During the week the attendance has been greater than at any previous display, and not only have the numbers been large, but the interest taken by the public has been in the direction of intelligent appreciation rather than the idle curiosity which was characteristic of many who were attracted to the earlier shows. The abolition of the arena, though detracting from the attendance of those who were drawn by mere curiosity, has been an advantage in reducing the number of those whose quest for free rides almost amounted to a nuisance last year. Trial trips have served their purpose in connection with exhibitions. At the Agricultural Hall they have done something in the past to popularise motoring; when held in the chilly days of the winter in the open air they serve to frighten intending

motorists by introducing novices to a pastime which at that season of the year is only keenly enjoyed by those of experience.

Consequently exhibitors have reason to be satisfied with the character of the people attending. Lords and ladies have been as critical of the "points" of cars as more commercial inquirers, and rarely has any Exhibition in any line of trade proved so remunerative to the occupants of stands. Already, as we write with two or three days for the Exhibition yet to run, the sales have amounted in the aggregate to many scores of thousands of pounds. On the opening day one firm sold five cars at an average price of £300 each, and another booked two orders totalling nearly £1,500. These two facts are sufficient to demonstrate the money value of the present display. It would be interesting to obtain some idea of the value of the orders booked at the Exhibition, and we shall be glad to hear from exhibitors who have formed estimates or can give us some idea from their own experience. Certain it is that the money value to exhibitors of the seventh show at the Agricultural Hall has far exceeded that of any of its predecessors.

Immediately on passing the turnstile the visitor is face to face with three rows of exhibits, which extend the whole length of the Arcade. On either side are accessories, etc., while the centre row is sufficiently varied to cause many to linger ere venturing into the Great Hall. There the display of bunting is kaleidoscopic in its effect, flags of all nations—including, of course, the countries most associated with automobilism, and not forgetting Italy—being suspended from the roof and presenting a gay and brilliant effect. But the brightness is not all aloft; an artistic intelligence has been infused into the decorations of the stands, and the view as seen by the visitor is striking indeed. Evidently the motor-car industry has gone safely beyond the period in which it was ridiculed. It

has risen above the ordinary commonplace trades of the country, and is one of the new hopes of those who wish to see the commercial and manufacturing pre-eminence of Great Britain maintained and increased.

Passing around the hall there is no lack of interest—the splendid carriage work and upholstery delighting the eye of the ordinary observer, while those interested in mechanical matters will appreciate the growing tendency to show *chassis* and the various working parts—a scheme of education which will

FIG. 1.—THE BARDON 12-H.P. LIMOUSINE.

probably be developed with each successive Exhibition. As already mentioned, the Great Hall does not include all the interesting exhibits. More than a score of exhibitors—principally the makers of heavy vehicles for the conveyance of goods and for municipal work—are located in the Minor Hall, while in the Gallery is a fine representation of the leading makers of accessories, parts, etc. In fact, so eager was the demand for space at the Exhibition that some makers of cars had to be content with positions in the Gallery—positions which have proved very satisfactory to those concerned, for the public has realised the importance of the exhibits there shown, and interested motorists have spent almost as much time in the Gallery as in the Great and Minor Halls.

In the centre of the building, opposite the entrance to the yard—the open space that last year was the scene of so much activity, and, at times, of excitement—is a grand floral display, which is really a refreshing splash of green among the dazzling red and white and other gay colours that abound. The wide space here, too, is serving a useful purpose, for at all hours of the day well-known men are to be seen chatting and conferring as though it were a village green—the central feature of the busy automobile world. For here in Islington are gathered this week all the men who are prominent in the British motor-car industry, and whose skill, energy, and enterprise, unrestricted by contracts that restrain the freedom of business, is adding new lustre to the manufacturing fame and increasing the commercial prosperity of the Kingdom.

The task of reporting upon nearly three hundred stands, which demonstrate the present position of the industry, and show the standard that has been reached in the United States and on the Continent, as well as at home, is no light one, nor is it one that can be undertaken by those who are not actually in daily touch with developments now taking place. But we make bold to say that our report, which will not omit a reference to any exhibitor, will prove a useful illustrated record of the Automobile's Club Exhi-

bition, the organisation of which has been carried out by Mr. Charles Cordingley without official or other help. Herewith we commence the report. It will be extended over the next few issues, so that firms not mentioned this week may be assured that the labours of the staff, who have personally visited every stand, will find exposition in our columns.

A marked improvement in design is noticeable in the latest types of Bardon cars to be seen at the stand of the Auto-Carriage Company, Limited. To deal first with the 12-h.p. cars, two of these are shown, one of them being fitted with a handsome limousine body, painted white, with red lines and brass edging (Fig. 1), and a *tonneau* with dark green panels and black beading (Fig. 2). The frame is made of channel steel. The motor is placed in front, across the frame, and consists of four working cylinders, each pair being placed end to end, and having an explosion-chamber to each pair of cylinders. The latter, as well as the valve-chamber, are water-jacketed, circulation being effected by a rotary pump and radiator. Each of the two crankshafts is provided with two flywheels, placed one on either side of the crank-bearings, thus ensuring an equal distribution of weight. Only one induction valve, one exhaust valve, and one sparking-plug are required for each pair of cylinders, thus reducing the number of parts requiring attention and simplifying the mechanism generally. The water-circulation is assured by a rotary pump: the water, after having cooled the cylinders, passes through a radiator fitted in the front of the car. A manometer, placed in full view of the driver, enables him to observe that a good circulation of water is maintained. A constant level spray carburettor is employed, the feature of which is the employment of a cone-shaped float, which, when the petrol has entered in sufficient quantity, acts immediately by pressing a metallic disc on a fixed leather seat. This arrangement is claimed to enable the supply of petrol to be completely shut off, even when the car is in an inclined position. The motor is controlled by a centrifugal governor fitted to one of the crankshafts, which acts upon the exhaust valve. The action of the governor may, however, be modified by the use of a foot accelerator provided for that purpose; while in addition a throttle is fitted on to the induction pipe, this being controlled by a hand lever. The ignition is effected electrically, the timing of the spark being controlled from the driver's seat. The two engine shafts drive the main shaft by bevel-gearing. The main shaft carries a clutch

FIG. 2.—THE BARDON 12-H.P. TONNEAU.

with double conical contact surfaces, upon which two sliding cones are pressed by the action of springs operated by a single pedal. Four speeds forward and a reverse motion are provided, these being controlled by a single lever. From the differential countershaft, the power is conveyed to the rear road-wheels by the usual duplicate set of chains and chain-wheels. The vehicles are fitted with

two powerful brakes, one controlled by a pedal and acting on a drum on the countershaft, the other actuated by a hand-lever, and acting on drums fitted to the sprocket rings on the rear wheels. Both countershaft and sprocket brakes are double-acting, and will brake the car when travelling either backwards or forwards. Special attention has been paid to the lubrication of the various parts, this being controlled from the driving seat. A special device is fitted to prevent back fires when the motor is being started, as unless the ignition is retarded the motor cannot be started. Equal-sized road-wheels of the artillery type are fitted, these being shod with 90 mm. pneumatic tyres. Another car on the stand is a 5½ h.p. *Bardon tonneau*. This is fitted with a two-cylinder engine, and has three forward speeds and reverse motion. In general arrangement it follows the line adopted in the larger cars. To enable visitors to get an idea of the quality of material and workmanship used in their cars, the Auto-Carriage Company display a wide range of detached parts.

The 10 h.p. cars (Fig. 2) shown by the Brush Electrical Engineering Company, Limited, have been so recently referred to in the *Journal* (see issue March 15th last) that no lengthy description is necessary. The motive power is supplied by an Abeille vertical two-cylinder petrol motor, developing 10 b.h.p. at a normal speed of 900 revolutions per minute. As a description of the engine was published in our issue of January 25th last, it need only be here mentioned that it is fitted with a centrifugal governor acting

spect. A new car now seen for the first time is the 16 h.p. *Brush tonneau*, the one shown having been built to the order of Mr. G. F. M. Cornwallis-West. This is fitted with a four-cylinder Abeille motor, which develops 20 h.p., a noticeable feature being the ease with which the valves may be taken out for inspection or other purposes. This engine is fitted with the ordinary electrical ignition only, but otherwise is similar in all respects to the two-cylinder engine in the 10 h.p. cars. Four speeds forward and a reverse motion are provided, these all being controlled by a single side-lever. The car has equal-sized road-wheels, and has a 7 ft. wheel base. In general arrangement it is similar to the 10 h.p. cars, its weight complete coming out at 18 cwt. A *chassis* of the 20 h.p. type is also on the stand, an examination of which will indicate that no pains are being spared to bring the Brush cars into the front rank of high-class automobiles.

Among the displays of carriage work the exhibits of Messrs. Salmons and Sons, though small in number, are excellent in finish and workmanship, the most conspicuous being a *tonneau* body fitted with a canopy and removable seats.

Lubricants for motor-cars are the feature of the display made by Messrs. Stern Brothers. Among the specialities shown are Sternoline lubricant for the bearings, Fram lubricant for the axles, Sternoline motor-car oil, Sternoline cylinder oil, Sternoline rust preventative, Sternoline elastic paste for gearing, cog wheels, chains, etc. This latter must be applied in a liquid state

FIG. 3.—THE BRUSH 10 H.P. CAR.

on the admission pipe, provision being made also to control the throttle valve from the driver's seat. The engine is fitted with three methods of ignition—electric, magneto-electric, and Auto-incandescent tube; the ordinary electric ignition is normally used, the others being held in reserve in case of necessity. The water circulation for the cooling of the cylinders is maintained by pump and radiators, the former being of the centrifugal gear-driven type, the gear being enclosed in the crank chamber. Three speeds forward and a reverse motion, controlled by a single lever at the side, are provided. The engine transmits its power through a pedal-controlled friction clutch to a change-gear box, and thence by bevel gear to a cross differential shaft, the usual duplicate pair of chains and chain-wheels connecting this with the rear road-wheels. Non-reversible inclined wheel steering is adopted, while both hand and foot brakes are available, each acting equally well, be the car travelling in a forward or backward direction. It may be added that the first result of applying either of the brakes is to release the clutch. The frame—of wood and steel—is supported by long springs on artillery wheels of equal size (32 in. diameter), these being shod with large pneumatic tyres. The weight of the *chassis* comes out at 10½ cwt., while the *tonneau*, with petrol, water, tools, etc., ready for a run, weighs 15 cwt. Special attention has been devoted to the question of lubricating the various bearings, while provision is made for the adjustment of the various working parts. On the stand are shown a couple of *tonneaux*—one being a duplicate of a car recently supplied to the War Office—and a *chassis* to enable the various parts, and their disposition to be in-

to chain and cogs. Specimens of the recently-introduced superheated steam oil for Gardner-Serpollet cars, recently referred to in our columns, are shown at the stand. This is a 800 degs. Fahr. high test oil. Here, too, are grease cups for crank pins and eccentrics, high-test vitroline oils, rusticide for preventing, and ferrubicide for removing rust, glandoline for packing, joints, etc. A well-arranged display is completed by a selection of Stauffer lubricants, spring pressure lubricators, asbestos compound, etc.

Oils, varnishes, and enamels of good repute are shown by Messrs. Craig and Rose, Limited, the specialities including a white enameline which dries in about twelve hours and hardens in a couple of days, presenting a bright and durable enamel surface. The "Rose" white enamel is also being largely used by builders of motor-car bodies, who recognise its great covering power, as well as the hard and solid surface which it secures. For use on coils, the winding of armatures, etc., a stoving insulating varnish has been prepared that will permanently resist currents of the highest voltage. Stoving readily and giving a tough and durable coating, it will not only provide efficient insulation, but also withstand the action of lubricating oils and moisture generally. Water-cooled motor oil, electric car varnish, dry colours, etc., complete a very interesting display.

Motor-car and other lubricating oils, greases, etc., are on the stand of Mr. P. Lawrence, whose specialities include axle grease, belting syrup, etc.

One or two of the White steam cars, made by the White Sewing Machine Company, of Cleveland, U.S.A., have been in this country for the past few months, but are now shown for the first time at any exhibition in England. While outwardly following the lines of American steam cars, the construction generally is of a more robust character, while in the details a number of new departures are made. In the White steam carriage we have a steam generator (Figs. 6 and 7) which is not a boiler. It consists of thirteen super-imposed helical coils of $\frac{1}{2}$ in. seamless copper tubing

FIG. 4.—THE WHITE STEAM PHAETON.

(except the lower or super-heating coils, which are of steel), and surrounded by a casing of thin sheet iron, covered with asbestos material, and at the bottom the heat is applied by means of a burner. The coils of tubing are so connected that the water entering at the top cannot pass through the successive coils

FIG. 5.—THE WHITE THREE-SEATED STEAM CAR.

below by gravity, but is held in place entirely subject to the action of the pump. The water comes in, and is at all times in the top of the coils, while the steam is in the lower coils, and goes out of the lowest coil next to the fire. There is no boiling water to generate steam; the upper coils act practically as water heaters, and the water is converted into steam at some variable point in the lower coils, depending upon the amount of steam which the engine

is using. The heating surface is equal to 30 sq. ft. *There is no water level to maintain, consequently no water-glass.* The makers claim that the generator is non-explosible and impossible to burn out. It is also unscalable, the generating coils having been found as clean after running over three thousand miles as when first made, any deposit being carried through as fast as formed. The water supply is automatically controlled by the steam pressure, by means of a plunger pump, thus doing away with all hand pumping. The steam, as it comes from the lower coil, is super-heated, thus insuring perfectly dry steam. The fire is automatically controlled by a special device which regulates the flame in such a manner as to furnish sufficient steam to meet all requirements, without entailing any care or thought on the part of the driver. The carriage can, it is stated, be run until the water supply is entirely exhausted, and it comes to a stop by reason of the lack of water in the generating coils, without the slightest danger of explosion or damage to the coils. The burner (Fig 8.) consists of two parts, a pilot-light and a main burner. The pilot-

FIG. 6.—THE WHITE STEAM GENERATOR, WITH CASING REMOVED.

light is used to keep a constant light while the carriage is in use: for lighting the main burner, which, under the control of its automatic regulator, is being turned off and on as the steam conditions require, also for heating the vaporising coils, so that the petrol passing through these on its way to the main burner is converted into gas. It is also employed in getting the carriage ready for use, which is done in four minutes or less, depending upon the skill of the driver, simply by means of a match. The burner is of the usual flat cylindrical shape, with air tubes extending through it vertically, expanded into the two heads. The upper head is formed with a series of concentric circular corrugations, the air tubes being arranged so that their centres coincide with the centre lines of the depressions, and the high ridge of the corrugations being slitted normal to its direction with a large number of fine saw cuts, through which the hydrocarbon gas issues, these slits taking the place of the numerous small drill holes around the air tube in the ordinary form of burner. The air tubes are of $\frac{1}{2}$ in. diameter. The petrol arriving from the tank (under air pressure) is led through a vaporising coil, bent into a number of loops in the space

between the burner and boiler; then through the auxiliary vaporiser, in series with the former and located over the pilot burner. By this time it is transformed into a gas by the heat of the flame surrounding the two vaporisers, and it now passes through the hand-controlled fuel valve, an automatic regulator and an injector into the burner casing, drawing in with it a considerable amount of air owing to the pressure with which it issues. The hand-controlled valve can be operated from the seat. The auxiliary vaporiser is heated in the first place by means of a sub-burner consisting of a little pan, into which some petrol is let run by opening a valve. When the auxiliary vaporiser is hot enough this burner is turned low and is kept burning continuously, whether the main burner is on or off. The time it takes to get the main burner ready to operate is said to be from three to five minutes. After the pilot-light is

FIG. 7.—PLAN OF WHITE STEAM GENERATOR.

once lighted, the carriage can be started and stopped without further attention to it. The fuel feed is automatically controlled by a thermostatic regulator which includes a tubular casing, forming the connection between the lowest and the next to the lowest coils in the boiler, so that the steam is always flowing through this casing. At one end the casing is closed by a cap, and at the other end by the head. Within the casing and secured to this head is a tube of copper, which is closed at its outer end, and within which there is a rod of iron or steel. Secured to the head is a casing in which is pivoted a bell crank, against which the rod may abut. The casing leads by a tubular opening to the burner, while into this opening is a passage from the casing containing the main needle valve. Within the tubular opening is a plunger, having a reduced lower end extending below the passage, and adapted to close or vary the opening to the burner, thus constituting a valve for the hydrocarbon. On the upper end of this plunger are adjustable nuts, which form a shoulder bearing on the upper edge of the bell crank, wherefore the bell crank supports this plunger. When the thermostat is not regulating the fuel the plunger is above the opening, and the hydrocarbon flows to the burner. The thermostatic tube being made of copper, a material of relatively high expansibility, and the rod within it of steel, of relatively less expansibility, when the two are heated by the steam the end of the tube draws back from the bell crank lever more than the rod expands in length, causing the rod to be moved backward from the bell crank lever, the latter allows the plunger to descend and partly or wholly close the opening to the burner. The feed is regulated by a pressure-controlled diaphragm device similar to the fuel regulator in steam carriages, but by-passing the flow when not required, instead of interrupting it, as do fuel regulators. When the amount of water in the boiler decreases the pressure rises, and then closes the by-pass valve, when all the water pumped is fed into the boiler. If this should

give an excess of water in the boiler the pressure drops and the by-pass opens again. The diaphragm spring is adjusted to keep the boiler pressure normally about 200 pounds, but the safety valve is set to 500 pounds, which it is said the boiler will safely stand. Whenever the throttle is shut the pressure will immediately increase to 350 pounds or more, but will instantly drop again when the throttle is reopened, for the reason that the automatic feed regulator has opened the by-pass and no water is fed to the boiler.

The 6 h.p. engine is of the two-cylinder, double-acting type, with a simple link reversing gear, and is well balanced in all its parts. The cylinders are 3 in. diameter by 3 in. stroke. The main journals and the eccentrics run on ball bearings. The slides and cross-heads are lubricated automatically from oil-cups. The cylinders are lubricated from a cup of special design, which is at all times under the control of the driver. These cups hold a quantity of oil sufficient for a run of ten hours. The exhaust steam is muffled, so as to be practically noiseless. The throttle is especially designed to do away with all the trouble of the throttle not closing, and remains at any point desired by the operator without being held. It is operated by a handle, which, to open, moves toward the driver as he sits on the right-hand side, and away from him to close. This handle can be removed and carried in the pocket when the carriage is to be left unoccupied, thus preventing its being started through carelessness or mischief. A hand auxiliary water pump is placed conveniently for the driver, where it can be used when necessary in starting, or in place of the power pump, in case, through accident, this should have been put out of action. Petrol is used as fuel. This is carried in a tank under the foot-board. It is forced by air pressure through the vaporising coils, and from there to the main burner, where it is ignited. The pressure is maintained by a hand pump, conveniently located, so that it can be used at any time without leaving the seat. The petrol tank has a capacity of eight gallons, which is stated to be sufficient to run the carriage from 75 to 100 miles, depending upon the condition of the roads. The tank is provided with three gauge cocks for the purpose of permitting the amount of fuel supply available at any time to be ascertained. The water supply is contained in a copper tank at back of and partially surrounding the casing of the boiler. The tank has a capacity

FIG. 8.—DETAILS OF WHITE BURNER.

of sixteen gallons, which is sufficient for running from 25 to 35 miles, depending upon the condition of the roads. The car is fitted with a condenser, to which is connected a pump and oil separator, to enable the condensed water to return to the tank.

The carriage is supplied with a powerful band brake, which will brake in either direction, and is actuated by a pedal. Speed is controlled entirely by the throttle. The vehicle is considerably heavier than most American steam carriages, weighing with supplies about 1,300 pounds. In the latest model the wheel base has been lengthened, and is now 72 inches. All four wheels are of the same diameter, are of cycle type construction, and shod with $3\frac{1}{2}$ -inch pneumatic tyres. The front and rear axle are composed of tubular arches, the front axle having no straight part, as is usual. The engine power is transmitted, as usual, by a chain to a differential gear sprocket located midway on the rear axle, and the latter is therefore a live axle in two parts, mounted on ball bearings, two arranged close to the wheel hubs and two close to the differential gear, one on either side. That the two bearings of the same part of the axle may always remain in alignment, the bearing near the hub of the wheel has a pivot support. The rear axle sleeves are provided at their outer ends with fittings forked in the same manner as front axle ends, these fittings serving to support the axle bearings and to fasten the reach bars. The forks embrace the ball-bearing housings and receive the pivots by which these bearings are supported in the arched rear axle. The housing or non-rotating member of the ball bearing forms a solid part with the rear axle sleeve. One of the cones of the ball bearings is slidable lengthwise on the axle between a shoulder thereon and the hub of the adjacent wheel. When the vehicle passes over a rough road the tubular rear axle arch will straighten out more or less, and this would result in a binding of the bearings, if this pivoted support and sliding cone were not provided to prevent it. The carriage is arranged so that all water can be drained quickly from it, in case it is to be stored in a place where there is danger of it freezing. Two cars are shown at the stand, an ordinary two-seated one (Fig. 4), the second having a spider seat for a third person at the rear (Fig. 5).

Quite a new car to the English market is the Elmore, shown by Messrs. Moffat's, Ltd. The vehicle, of which an illustration is given in Fig. 9, is of American design and construction. A novel feature of the car is the use of a two-cylinder vertical motor, the usual position being reversed—that is to say, the crank shaft is at the upper end and the combustion chamber below. The engine, which is of the two-cycle type, as against the four-

FIG. 9.—THE ELMORE CAR.

cycle usually employed, develops 5 b.h.p. at a speed of 600 revolutions per minute. Each cylinder has its own fly-wheel, the vibration being thereby greatly reduced. The cylinders are 4 in. in diameter by 4 in. stroke, and are water-jacketed, the circulation being maintained by pump and radiators. A governor acting on the admission pipe is fitted. The ignition is on the dynamo-accumulator system. A double cell storage battery

is used on starting the engine; and afterwards, by the use of a double-pole switch, the current is changed from battery to dynamo, which is driven by a belt from the rim of one of the fly-wheels. The dynamo, engine and battery are so wired that either dynamo or battery can be used for starting or running the engine, and by use of the charging switch the battery can be charged from the dynamo while the car is running. Three speeds forward and reverse motion by means of clutches and gear wheels are provided,

FIG. 10.—THE BLAKE 7 H.P. MOTOR.

the engine being connected to the countershaft by gears, a chain conveying the power from the countershaft to the rear axle. A double-acting brake, operated by a foot lever, is fitted on the drum enclosing the differential gear on the rear axle backward or forward. The frame is made of seamless tubing. The cycle-type road wheels are 28 in. in diameter, and are fitted with extra heavy $2\frac{1}{2}$ in. tyres. The body is of the box front pattern. Steering is controlled by a horizontal lever. The car, which is claimed to be able to attain a speed of twenty miles per hour, weighs about 9 cwt.

Mr. F. C. Blake, who makes a speciality of induction coils and sparking-plugs, has a large display of these ignition accessories, and among the latter is a new plug with English gas thread, and with a shield to prevent oil or carbon getting on to the sparking points and porcelain. Tanks for water, petrol, and oil are another speciality of Mr. Blake, these being shown in a variety of shapes and sizes. The Blake diaphragm carburettor and water-cooling coils have already been described in our columns. An interesting exhibit is the new Blake 7 h.p. double-cylinder motor, illustrated in Fig. 10. The two cylinders, with their water jackets, are cast in one piece, and are mounted on an aluminium oil-containing crank chamber. The cylinders are 90 mm. diameter, by 102 mm. stroke, the normal speed being 1,000 revolutions per minute. The exhaust valve cams are entirely enclosed, while provision is made for the ready withdrawal of all the valves. Electrical ignition is adopted, contact being made by a special rotary distributor. A four-cylinder motor, developing 15 h.p., is also to be seen; this consists of two of the small-sized motors mounted on one large crank chamber. Automatic splash lubrication of the cylinders is adopted. Both the 7 h.p. and 15 h.p. engines are fitted with an enclosed governor, which acts on the admission pipe. The new Blake voiturette had not arrived when we visited the stand, but by the time these lines are in print it will be on view, so that a brief description will not be out of place. It is fitted with a two-cylinder horizontal engine developing from 4 to 6 h.p., according to the speed. The motor transmits its power by a chain to the gear box, which is adapted to give three speeds forward and reverse, while from the gear box a single centrally-located chain conveys the power to the rear axle. A pedal actuates a band brake on the differential shaft, while there

are hand-operated band brakes on drums connected with the hubs of each of the rear road-wheels. The car, which is remarkably silent in operation, is adapted to carry two persons on the front seat, at the rear being room for luggage or a detachable spider seat. It may be added that the water-circulation for the cooling of the cylinder is on the thermo-syphon arrangement, the water in circulating between the cylinders and the tank passing through a Blake radiator.

The Straker Steam Vehicle Company, Ltd., who have been devoting attention to the question of heavy steam vehicles for some time past, have now entered the commercial arena, and have on view a couple of their five ton steam waggons—one built with open-sided body for a Bedford firm, and the other is intended for service in Johannesburg, South Africa. The vehicles (Figs. 11 and 12) are 17 ft. 9 in. long, by 6 ft. 6 in. in extreme width, the wheel base being 10 ft. They are designed to carry

through a central down-take, regulation being obtained by a damper fitted at the base of the funnel. The draught is created by the exhaust steam entering through a nozzle into the chimney; provision is also made for a live steam blower, if required. The

FIG. 11.—ELEVATION OF STRAKER STEAM WAGON.

FIG. 12.—PLAN OF STRAKER STEAM WAGON.

a net load of five tons at a maximum speed of seven miles per hour, to be capable of ascending gradients up to one in nine, and to draw a trailer carrying an additional load of two tons on fairly level roads. The back axle is of the rotating type, it being secured to the frame through the medium of strong laminated springs and radius rods. The leading axle is mounted on a central pivot directly under the boiler, and takes the weight of that portion of the vehicle through anti-friction bearings. The boiler is of the water-tube type. It contains 70 sq. ft. of heating surface, and 2.2 sq. ft. of grate area, the working pressure being 200 lbs. per sq. in. The boiler is placed in the centre of the front of the vehicle, the fittings being arranged within easy reach of the driver. A superheater is attached to the fire-box for dealing with the high pressure steam, and a re-heater for rendering the exhaust steam invisible. Coke fuel is used exclusively, the firing being effected

boiler is fed either by above injector, or by means of a direct-acting plunger pump driven off the engine crankshaft; the capacity of either being more than sufficient to deal with the requirements of the boiler.

The road wheels are made of two steel flanged spoke plates, riveted to a steel tyre on the peripheries and cast into an iron boss by special process, thus forming practically an indestructible wheel.

The engine is of the compound horizontal type, fitted with single eccentric reversing gear, admitting of linking up to requirements, enclosed in a dust-proof casing of sheet iron. The cylinders are 4 in. and 7 in. by 7 in. stroke. The normal speed is 375 revolutions per minute, which can be increased up to 500. The lubrication of the working parts is arranged on a complete system providing for continuous oil feed, only the ordinary

attention necessary with locomotives and other machines of a similar class being required. Two gear speeds are provided, giving speeds from three to seven miles per hour. The engine crankshaft is extended in square section, upon which is mounted a sliding double pinion thrown in and out of gear by a hand-actuated device. This pinion meshes with gear wheels mounted on the countershaft, upon which a sprocket pinion is fixed, and by means of a roller chain the power is transmitted to the back axle. The back axle is 4 in. in diameter. The differential gear, which is secured to the sleeve carried at the right side of the axle, is designed so that a locking pin can be instantaneously inserted for connecting up the two parts of the axle in order that both wheels may become drivers as occasion may demand. The steering is effected by worm and segment, the leading wheels being turned by screw and worm hand gear, which is self-locking in all positions. The vehicle frame is constructed in channel steel of heavy section, braced together with transverse channels, T irons, gussets and angles. The single eccentric reversing gear is specially suited for acting in the capacity of a strong brake, and will, it is claimed, stop the vehicle under any ordinary condition. There is also attached a powerful hand brake bearing direct on the tyres of the rear road wheels, actuated from the driver's seat. Sufficient fuel is carried for a short day's work; it is stored in the two bunkers arranged either side of boiler.

A water tank of 140 gallons capacity is secured to the back of the frame, which in the ordinary way will provide sufficient for runs of from fifteen to twenty miles without replenishing. A steam ejector fitted with a 25 ft. length of $1\frac{1}{2}$ in. suction hose and strainer is provided, so that water may be filled in about five minutes by plunging the hose into any tank or pond. Under normal conditions the inclusive cost of working a five-ton Straker waggon is stated not to exceed 2d. per ton mile. The waggon, carrying five tons of net load on ordinary roads on a point-to-point job of say forty miles in extent, is claimed to be capable of maintaining an average speed of five miles per hour, inclusive of delays for taking water, clinkering, etc., at a fuel consumption of from 12 to 14 lbs. of coke, evaporating ten to gallons water per vehicle mile.

A new sprag, which has successfully passed through tests on Netherhall Gardens, Hampstead—one of the steepest inclines

when out of action. It can be easily operated by the driver, and the blocks readily brought down to the ground. More familiar specialities at this stand are the "Wellington" sparking-plug and the "Wellington" gas-engine ignition tube, while copies of the "Wellington Motor-Car Register" serve to draw attention to an important development of this firm's business. Among the cars on this stand are a 20 h.p. Panhard, a Panhard fitted with 7 h.p. Centaure engine, a 6 h.p. De Dion, and a New Orleans.

Messrs. R. M. Howison and Co. are introducing a new principle of constructing motor tyres, and have an exhibit of tyres made in

FIG. 14.

FIG. 15.

this way. So far, Messrs. Howison and Co. have only applied their principle of manufacture to single-tube tyres, but the notion is equally applicable to all tyres, both single-tube and detachable. The new departure made in the "London Penna" tyre consists in alternating the protective fabric introduced into the outer walls of the tyre for the purpose of securing strength with a layer of pure rubber. Figs. 14 and 15 show the difference between a tyre of ordinary construction and the "London Penna" tyre, Fig. 14 representing an ordinary single-tube tyre, and Fig. 15 the new form. It will be noticed that in the ordinary method of manufacture the air-tube is protected by a number of layers of fabric covering all crowded together, one on top of the other, and outside these layers of fabric is the rubber tread of the tyre. The object of multiplying and crowding together the fabrics is, of course, to obtain strength. It is claimed, however, that in one way the additional number of fabrics really increases the weakness of the tyre, because when the tyre is over-weighted, or when the weight upon the tyre exceeds the air pressure inside, it is liable to flatten on the tread, bringing the sides to more or less of a sharp angle, and as ordinary construction of the tyre does not allow of much movement or flexibility, the threads of the fabric are liable to get strained and crack, and eventually to break at the angle. In this way small breakages of the tyre occur, which are ascribed by motorists to punctures, but which really proceed not from punctures, but from the breakage of the threads of the fabric, owing to their being constantly strained by the flattening and re-inflating of the tyre on the tread. The interposition of the layer of pure rubber between the layers of fabric is claimed to have remarkable effect upon the movement of the tyre. Greater flexibility and greater resiliency are said to be added to the tyre, and the liability to puncture is also decreased, as it is found that the sandwiching of the layer of rubber between the layers of canvas causes the tyre to offer better resistance to puncture material, and is more difficult to penetrate than when a number of fabrics are laid one on top of the other for the purpose of strengthening the tyre. The "London Penna" tyre is made of very good rubber, so that its durability is of the best character, quite apart from any question of increased wear resulting from the special construction.

Sample castings for motors are exhibited by Dover, Limited. Here are castings of gear-boxes, connecting rods, bearings, gear cases, sprocket wheels, valves, etc., in gun-metal, aluminium, anti-friction metal, phosphor bronze, etc.

FIG. 13.—THE NEW MOTOR-CAR SPRAG.

near the metropolis—is shown on the stand of Messrs. Frank F. Wellington, Limited. A steep ascent of one in four has been set up for the purpose of demonstrations, and the efficiency of the sprag, which can be attached to any car, has been adequately shown. The accompanying illustration (Fig. 13) shows the sprag

A feature of the Show is the appearance of several new steam cars of English construction. Among these are those of the Steam Car Company, House's System, Limited, who are showing three vehicles—a two-seated doctor's car, a four-seated phaeton (Fig. 16), and a parcel delivery van intended to carry a load of one ton. As the mechanical parts of these vehicles are identical, the following description may be taken as applying to each. The boiler, which is located at about the centre of the frame, is of the fire-tube type, and comprises 280 copper tubes. Chief amongst its novel features is a mud-trap. A detachable circular plate some 6 inches in diameter covers a hand-hole in the top plate. Through the centre of this plate the feed water is let in from the feed heater by means of a tube connection and union joint. Bolted to the underside of this plate are two concentric cylinders, which extend to the bottom of the boiler. The outer one of these is closed at the bottom, and only perforated laterally near the top. The centre tube, which forms a prolongation of the water feed tube, is perforated by numerous holes throughout its entire length, and extends to nearly the bottom of the outer tube or cylinder. The feed water therefore enters through the centre tube and flows up between it and the outer tube, only entering the boiler proper when leaving the top of the latter. The sediment it may contain is deposited between the two tubes, and when the plate to which they are attached is disconnected they are lifted out with it, and the sediment may be removed. When the plate and the mud-trap are thus removed, a hand-hole is exposed, through which the boiler tubes may be cleaned. The boiler is tested up to 500 lbs. to the square inch, and the working pressure is 250 lbs. By this means the wasted products of combustion are utilised to raise the temperature of the feed water before going into the boiler. The burner, which is of the well-known Lifu type, burns common paraffin. It is led from the tank through a coil of tube and the vaporiser placed in the flame area of the burner where the oil is vaporised, the vapour there formed being conducted to a conical nozzle. This is surrounded by an air tube, shaped conically at its lower end to correspond to the conical vapour nozzle. The actual size of the orifice through which the vapour issues is varied by a needle shaped plug which fits down into it, and is controlled by a spring tending to keep it down in its seat, it being forced up by the vapour pressure. The height to which it rises, and the consequent amount of oil vapour allowed to issue from the nozzle, depend upon the pressure of vapour, and that in turn depends upon the oil feed, so that the regulation of the fire is effected by an automatic regulator worked by the steam pressure in the boiler, while the fire can also be controlled from the driver's seat. The oil is maintained in the oil chamber at a pressure of 30 lbs. The oil tank contains a supply of 15 gallons of oil, the water tank holding 45 gallons, sufficient in the former case for from 60 to 90 miles, and in the latter to 45 miles, according to the character of the roads traversed. The level of liquid in both these tanks is indicated on a small dial in view of the driver. For filling the water tank an injector is employed.

The engine itself is of the double cylinder compound double-acting type, the crank chamber of which is formed by a rectangular enclosed metal box, which contains the oil for lubricating the cranks and piston rods. The crank shaft carries a single pinion, which meshes with a toothed wheel on the periphery of the compensating gear on the rear axle, which is enclosed in a prolongation of the crank chamber.

A special feature of the engine is that both the cylinders, which are respectively $2\frac{1}{2}$ in. and $4\frac{1}{2}$ in. diameter by $3\frac{1}{2}$ in. stroke, while normally running as high and low pressure cylinders, may by a special controller and intercepting valve be made to work with high-pressure steam when additional power for hill climbing is required. On the side of the crank chamber is a double throw pump, one side of which pumps water into the boiler, the other portion of it pumping oil into the oil tank, where its pressure is maintained by an air cushion in the usual way. As regards the moving parts of the engine they are of marine type, the admission of

steam to the cylinders being by piston valves instead of the ordinary slide valves. The oil and water pump already alluded to is driven direct from an eccentric mounted on the rear axle. The whole motor is suspended by a double ball-jointed rod from a bracket above the rear end of the cylinder. A tubular condenser of the marine type is carried in front of the car underneath the foot-board, which condenses the greater volume of the steam. Any steam left uncondensed by the condenser is led into the smoke-box of the boiler, where it is burnt up, assisting to increase the draught, and escaping ultimately through an orifice at the back of the car.

The steering is on the side-post and lever principle. There is little or no pressure on the steering handle, from the fact that the axle bearings are so designed as to take the load direct from the periphery of the steering wheels on to the axle pivot. The brake power of the car is very effective. In the first place, the engine can be reversed, thus forming a powerful brake. In addition there are two pedal-actuated brakes, one on each of the hind wheels, of an entirely new design. The brake consists of a hollow drum, of suitable shape, fitted on to the hub

FIG. 16.—THE STEAM CAR CO.'S DOUBLE PHAETON (HOUSE'S SYSTEM).

of the hind wheel, a groove being cut out of the inner periphery. Into this groove two levers shod with fibre are expanded. It acts whether the car is running backwards or forwards, the pedal being provided with a notched quadrant into which a holding stop slips, so that the brake can be held hard on without putting any strain on the driver's foot. The two-seated car weighs 17 cwt., and the van about one ton. At this stand is also to be seen an unfinished body for a doctor's car, the feature of which is the front sliding doors.

Two well-finished motor bodies form the exhibit of Messrs. Hollick and Pratt. One of these is called the "Allweather" car body, and is fitted with a canopy and circular glass frames in the front. These are made in the form of triple shutters, and can be adjusted to form adequate protection from wind, rain, etc., in front, and also at the sides. The other exhibit of Messrs. Hollick and Pratt is a *tonneau*-shaped body, with a screen and folding canopy, so devised that it can be rapidly taken off and packed out of sight on the car. Thus, being readily to hand, it can be put into position again when required.

In the Gallery the Law Accident Insurance Society, Limited, is bringing before the notice of motor-car owners its policies of insurance in connection with automobiles. These include indemnities against accidents to owners, fires, public liability, burglary, personal injury to passengers, accidental damage to car, and other mishaps which may occur to motor-vehicles. The Society is also accepting premiums for insurances in connection with motor-bicycles, tricycles, or quadricycles, and is offering advantages which are evidently being appreciated by owners of automobiles of every type.

One of the notable sections of the Exhibition is the interesting array of heavy steam vehicles, a branch of the motor industry in which Great Britain is unsurpassed. In referring to this

FIG. 17.—THE THORNYCROFT STANDARD BREWER'S STEAM LORRY.

class of automobile, the name of the Thornycroft Steam Wagon Company, Ltd., naturally comes to the front, for their vehicles are now at work all over the country performing a variety of duties. The general arrangement of the Thornycroft steam vehicles has frequently been dealt with in the *Journal*, so that only a brief reference to the exhibits is necessary. First we have a covered waggon built for brewers' use (Fig. 17). It is intended to carry a load of from 3 to 3½ tons, and to haul a further couple of tons on a trailer at a speed of about six miles per hour. The vehicle is driven by a horizontal compound engine of 25 to 30 h. p., completely enclosed, and lubricated by the "splash" method. The engine is reversible by means of the reversing lever at the driver's right hand. If desired, by means of the converting cock, high-pressure steam may be admitted to the low-pressure cylinder, giving the extra power which might possibly be needed in exceptional cases. The power transmission is on the company's well-known chainless principle, which allows a play on the bearing springs of as much as 7 in., whilst maintaining a perfect constant drive, and has been found quite satisfactory in use. The boiler is of the annular water-tube type, with straight tubes specially arranged so as to be easily cleaned both within and without. It is fired from the top, which can easily be done by the driver while attending to his work. The fuel used is either coke or

Welsh steam coal. Another vehicle on the stand is a tip waggon of the type now used by many municipal bodies for dust-removing purposes (Fig. 18). It is constructed to carry on ordinary

macadam roads a load of five tons up a gradient of one in seven, and the average working speed is about six miles per hour. On a separate stand the Thornycroft Company show a steam vehicle similar to the one which secured the first prize in the War Office trials in December last. This waggon is constructed to carry a load of from three to four tons, and follows the standard lines throughout, with the exception of the road wheels, which are of larger width than usual, and provided with shoes to enable the vehicle to travel on heavy ground. The wagon is painted in the regulation khaki colour and is attracting considerable attention from military visitors to the Exhibition.

An 8-h.p. tonneau completely upholstered in air-cushions is being shown by Messrs. Warburton, Allen and Co. in the Gallery. These cushions are also made separate for the seats of cars—to fit vehicles of any size. A new air footstool for use on automobiles has also been introduced by the firm. These cushions are made of strong duck-coated special pure rubber compound, which is rendered more durable by being vulcanised. To prevent the cushions losing their original shape the walls of them are stayed, with the added advantage that greater strength is secured. Their use on motor-vehicles for the backs and cushions of seats con-

FIG. 18.—THE THORNYCROFT STANDARD TIP WAGON.

siderably lessens vibration, and they have the advantage of being non-absorbent of damp and the impurities that cling to cloth-covered cushions.

The well-known Aster petrol motors form the principal display at the stand of the Begbie Manufacturing Co. These are shown in various sizes, viz., $3\frac{1}{2}$ h.p. air-cooled, 5 h.p., $6\frac{1}{2}$ h.p., and 9 h.p., the latter being all of the single-cylinder water-cooled type. Fig. 19 gives a view of the Aster two-cylinder motor developing 12 h.p. The cylinder diameter is 88 mm., and the stroke 110 mm., the normal speed being between 1,500 and 1,600 revolutions per minute. The two cranks are set at an angle of 180 deg. to each other. An interesting new departure of the 12 h.p. engine is the governor with which it is now being fitted. The object which the governor, of which a section is given in Fig. 20, is intended to serve is to ensure a speed as uniform as possible for all variations of power required of the motor, below the maximum, by acting on the admission of gas without changing the composition of the mixture. The Aster firm has devised a governing apparatus in which the atmospheric pressure has no detrimental influence, and

FIG. 19.—THE ASTER 12 H.P. MOTOR.

which is therefore balanced; which, further, opens and closes so rapidly that the charge is admitted either normally or is not admitted at all. In this manner variations in the richness of the charge are avoided, and also unforeseen variations in the operation of the carburettor. The device consists of a hollow cylinder A, inclosing all the parts of the governor, and connected by two tubes on its opposite sides to the carburettor and the motor respectively. These tubes, which have a circular section outside the casing, are flattened out where they approach the axis of the cylindrical casing in such a manner that their intersection with the internal surface of the hollow cylinder well is a rectangle bent to the shape of the cylinder surface. The openings thus formed are at least equal to the area of the tubes, and the small side of the rectangle is parallel with the axis of the cylinder. The dimension of the large side of the rectangle is less than the diameter of the cylinder. Hence a space remains between the extremities of the two parts. In the axis of the cylinder is located a shaft E provided with two collars F and F. Between these collars is a disc G capable of sliding on the shaft E, and turning with it. The disc G is provided at its outer circumference with a lateral flange H, while more toward the centre is pivoted on this disc a pair of balls K, similar to those employed in ordinary governors. A coiled spring R of suitable compression rests on one end against the collar F, and at the other against the disc G. The device is so constructed that when not in operation the disc G rests against the collar F under the action of the spring R. Under this condition the balls are close to the shaft and the flange A of the disc G is flush with the large side

of the rectangular openings, thus leaving the latter fully open. When the motor to be governed throws the shaft E in motion, the disc G turns with it, carrying the balls K along. Owing to the centrifugal force the balls tend to separate and to push the disc G towards F by compressing the spring R, since the balls have their resting point on the collar F. When the motor works with full admission its speed accelerates and the centrifugal force on the balls overcomes the pressure of the spring. The disc G then moves on the shaft E towards the collar F, and by this motion the flange H closes the rectangular openings to the casing. When the openings have been closed no charge is admitted, and the speed of

FIG. 20.—SECTION OF ASTER GOVERNOR.

the motor is reduced. The action of the centrifugal force on the balls diminishes and the spring causes the disc G to recede and the passage through the casing to open again. It will be seen that only a very slight motion of the disc G is necessary to completely close the passage. The governor acts on the hit and miss principle. It may be adjusted to operate at any speed desired by varying the compression of the spring R, for which purpose the sliding collar F and the shipper lever I are provided. Our attention was next drawn to the Begbie-Audin radiating coil (Fig. 21), the feature of which is the use of flat tubes in place of tubes of round section. It is claimed that increased efficiency is thus obtained, the water circulating in the form of a very thin sheet, steadily in its course, and leaving its warmth in the copper tubing, which, being fitted with a quantity of fins, sends the heat of the water into the air. The Begbie Company make a speciality of spare parts for Aster motors, and have a large array of these on view, in addition to Bozier and Aster change-speed gears

FIG. 21.—THE BEGBIE-AUDIN RADIATING COIL.

Messrs. F. Wilkinson and Co., who have acquired the sole agency for Great Britain for the steam cars made by the Steamobile Company of America, of Keene, N.H., U.S.A., exhibit a couple of these vehicles, those shown being of the two-seated type (Fig. 22). In general appearance they closely resemble the light American steam cars, but as they are now shown for the first time, and as they comprise a number of special features, the following description may not be without interest. The engine is of the simple two-cylinder, double-acting type. The diameter of the pistons is three inches, and the length of stroke is $3\frac{1}{2}$ in. The regular Stevenson link motion is employed. The engine frame comprises a protective covering for the reciprocating parts. This covering is continued below the line of the main shaft in the shape of aluminium "boots" which permit

the engine to run in oil. All wearing parts are easy of access and may be readily taken up. The bearings are bronze metal and tool steel. The pistons are composed of four rings, and the piston rod is of bronze, strongly secured at both ends. The journal bearings are of bronze, and provided with means for taking up wear. All steam joints are provided with metal packing, and the cylinders and steam chest are lagged with asbestos and covered with a sheet metal case. The boiler is 16 in. in diameter and 13 in. high. The shell is of cold drawn seamless steel, $\frac{3}{8}$ in. thick, the heads being $\frac{1}{4}$ in. thick. There are 420 $\frac{1}{2}$ in. copper

FIG. 22.—THE "STEAMOBILE" TWO SEATED CAR.

tubes affording a heating surface of 52 square feet, and each boiler is fitted with a fusible plug. In the event of extremely low water this plug will melt, and thus warn the driver of the condition of affairs before damage can be done to the crown sheet by scorching. A specially designed water glass is used, which includes check valves, besides positive globe valves, and facilities for unseating the checks if lodged. There is also a blow-off cock for cleaning out the glass. The water pump is attached to the cross head. It is of such capacity that the water flow is sufficient for the greatest demand upon it. At other times the surplus discharge may be regulated by the hand bye-pass valve, which is located under the seat at the left side; it has a sliding handle, which may be pulled out and the pump operated while the carriage is in motion. Like all modern steam cars, the Steamobile is fitted with a steam water lift. Instead of the laborious operation of pouring many buckets of water through a small opening in the tank, the driver, on finding his supply diminished, tosses the strainer end of the hose into the watering-trough, or whatever the source of water supply at hand may be, and, turning a valve beneath the seat, quickly fills the tank. One end of the hose is permanently attached to the inspirator, and the entire operation involves only the coiling and uncoiling of the hose in a compartment of the tool-box. The exact amount of water in the supply tank is shown at all times by an indicator on the side of the body, visible from the driver's seat. The pressure in the petrol tank is maintained by an air-pump which works off the engine. The amount of pressure is under the control of the driver, and is usually from 40 to 50 lbs. A hand-pump is provided to obtain the initial pressure. "Firing up" is effected by applying a match inside a simple device on the burner, which sets the pilot light going. Almost immediately the main burner may be turned on. The exact time of firing up, from striking of the first match under a boiler two-thirds full, to obtaining a steam pressure of 160 lbs., is stated to be seven minutes. The pilot light continues to burn under all circumstances, keeping the vapour tubes hot, and relighting the fire automatically when the main burner is shut off. When the automatic diaphragm valve affects the fire as a result of high steam pressure, its cut-off is complete, so that the steam never rises to the point of blowing off through the safety-valve. As a result of this arrangement the

machine may be left standing indefinitely with steam kept up automatically, always ready to start. Two band-brakes, operating with equal certainty forward or backward, are at the command of the driver. The two brakes act independently, and are operated by separate pedals, one always being in reserve for emergency, or reinforcement of the other. The frame is a flexible one. The heavy tubes which form the "reaches" run forward and converge in a pivoted yoke on the front axle arch. Braces from the ends of the front axle swivel at a central point toward the rear. In this way the frame conforms to any possible irregularity of the road, all torsional strain being done away with (see Fig. 23). The wheels are 30 in. in diameter, with either wire or tubular steel spokes, running on roller-bearings, and shod with $2\frac{1}{2}$ in. single-tube pneumatic tyres. The differential gear is made up of spur gears (not bevel), which run in oil. The car is controlled by a side-steering gear attached to the body and connected with ball-joints, so that no vibration is felt on the steering handle. The water-tank has a capacity of 26 gals., which is stated to be sufficient for a run of from 25 to 40 miles, according to the character of the road. The feed-pipe supplying the boiler is covered in the tank by a detachable strainer. This is immediately over a cap in the bottom of the tank. Any dirt which has gained access to the tank is deposited in this cap, and may be removed by unscrewing it. The water, after leaving the pump, is carried in a coil through the muffler, and reaches the boiler at nearly boiling temperature. The petrol-tank has a capacity of 8 gallons, said to be the equivalent of from 70 to 100 miles of riding. The same arrangement for straining and drainage obtains here as in the water-tank. A simple device is attached to the tank, which enables one at any time to know how much fuel still remains. The gauge consists of an ordinary water-glass guarded by metal bars. At the top and bottom are globe valves shutting off all connection between the gauge and tank, except when momentarily opened to determine the fuel level. All the valves are conveniently located on one side of the vehicle, and the control of fire, water, air, steam, starting, stopping, and steering are in the hands of the driver in his seat, while a detachable auxiliary throttle valve handle enables him to leave the machine locked. The throttle valve is designed to close itself in the event of an accidental opening. A slight pressure is, therefore, always necessary to hold the throttle open. The muffler combines a device for condensing steam and minimising the visible exhaust.

FIG. 23.—THE UNDERFRAME OF THE "STEAMOBILE."

Beneath the seat is an asbestos slide, and on either side are oval screened openings, in order to prevent the heating of the seat to the discomfort of the occupants. The arrangement for carrying tools and accessories is ingenious. The floor is hinged, and folds back, spreading out the complete kit strapped on the underside of the flooring. In the compartment thus exposed is coiled the ejector hose, besides any additional accessories that may be desired. From the engine the power is conveyed to the rear axle by a strong roller chain. The standard two-seated car, completely equipped with fuel and water, weighs about 11 cwt.

Goggles and glasses for motorists are being shown by the Symetric Lens Company, and also the Isometric Lens Company, the representatives of both of which companies have been actively engaged throughout the week in attending to the optical requirements of visitors.

With the Show the Motor Traction Company, Limited, introduce another Continental-built car to the English market. This is the Germain car, which, generally speaking, follows the Daimler and Panhard lines. We first examined the 15 h.p. *tonneau* (Fig. 24), built to the order of Martin, the well-known jockey. This is fitted with a four-cylinder vertical motor, which runs at a normal speed of about 700 revolutions per minute. It is set under the bonnet, under the fore part of the frame, and is fitted with both tube and electric ignition and pump circulation. In connection with the latter it may be mentioned that an indicator is fitted to the dashboard to show whether the pump is working or not. A Panhard type of governor is employed, in connection with which is fitted an accelerator. The engine transmits its power through a pedal-operated clutch to the gear box, which is adapted to give four speeds ahead and one reverse motion, controlled by a side lever. From the gear box the power is conveyed by bevel gear to a differential cross shaft, and thence to the rear road wheels by the usual duplicate pair of chains and chain wheels. Special attention has been devoted to the question of brakes and lubrication. The road wheels are of equal size, artillery type, and shod with stout pneumatic tyres. The *tonneau* body is of liberal dimensions to render it comfortable in riding. Another Germain car with *tonneau* body to be seen is fitted with a two-

making for automobile manufacturers, and in addition to their malleable iron castings have a large display of ordinary iron castings.

From the Malmö Glove and Leather Factory, in Sweden, Messrs. J. Feis and Co. have a large collection of leather suitable for motorists' clothing, etc. Among the special features of this display is a jackal fur coat, while the ordinary specialities include jackets, gloves, capes, rugs, trousers, knickers, etc., in leather.

On the stand of the Furriers' Alliance, Limited, a splendid collection of furs is attracting notice to the motoring clothing manufactured by the firm. Fur coats, muffs, hats, caps, and gloves are the leading specialities on view, a novel motorist's coat being one made up entirely of rabbits' ears, the appearance of which is decidedly effective.

Mr. Rowland Hill makes a bold show of motor castings in gunmetal, iron, phosphor bronze, aluminium, etc., the specimens of which shown on his stand have all been taken from orders now in progress. It is almost impossible to enumerate the full range of castings which he displays, but notable among the many are twin and single water-cooled cylinders, air-cooled cylinders, and combustion chambers, made from the patterns of some of the best known of English automobile firms.

FIG. 24.—THE 15 H.P. GERMAIN TONNEAU.

cylinder motor developing $7\frac{1}{2}$ h.p. As regards the transmission, brakes and general arrangement, this is identical with the 15 h.p. car above described. Of Boyer cars, of which the Motor Traction Company make a speciality, a big display is made. These vehicles have already been described and illustrated in the *Journal*, so that a brief reference will suffice on the present occasion. Three sizes are shown—7 h.p., 9 h.p., and 12 h.p.—all fitted with *tonneau* bodies. The 7 h.p. car is fitted with a single-cylinder Aster motor, and has three speeds ahead and one reverse motion. The 9 h.p. car has a double-cylinder Buchet motor, three speeds and reverse. Of the 12 h.p. vehicles, two have Buchet two-cylinder motors, with four speeds forward and reverse motion, the third having a double-cylinder Aster engine, and three speeds forward and reverse. All the vehicles have inclined hand-wheel steering, equal-sized artillery type road wheels, shod with pneumatic tyres, and brakes acting in both forward and backward directions. The motors are all equipped with governors acting on the admission pipe, so that the engines can be kept running quietly at a slow speed when the car is stopped. The bodies are all comfortably upholstered, and painted in various colours, the one in olive green, red, and black taking our fancy.

Malleable iron castings of motor-car parts, including gear wheels, hubs, etc., are the main exhibits of Messrs. Floyd and Floyd, Limited. This firm make a special feature of pattern-

In a prominent position in the Arcade, Messrs. Moebius and Son have a capital show of their special oils for automobiles. It is well devised to show to advantage the firm's enamelled canisters in which the oils are supplied, various colours distinguishing the special brands. Certain oils are in cans fitted with a spout, so that they can be emptied without the disagreeable dripping associated with some patterns. Attention may well be directed to the mark "M" for motor-cycles—an oil which is being largely adopted by well-known riders. Other special oils include lubricants for motor cylinders, air or water-cooled motors, motor axles, etc., while the "Moebius" motor grease for gear wheels has also a place on the stand.

Prominent in the Show is the display of Messrs. Hoare and Sons, whose ideas of the clothes suitable for motorists have found much favour. A "Mota Perfecta" coat, the well-known "Autocoat" and "Autosuit," and a fur "Autocoat" for use in very rough weather, are prominent in the general selection, while Autocloaks and an "Autocoatette," for ladies' wear, have good features. A new automobile waistcoat, suitable for wear under any ordinary coat, is also shown. This is fitted with wind cuff sleeves and amply provided with pockets. Good styles of uniforms and liveries for motor-car drivers and servants have also a place in Messrs. Hoare and Sons' range of manufactures and designs.

Since its introduction a year or so ago, several changes have been made in the Traveller voiturette (Fig. 25) built by the Alldays and Onions Co., Ltd. The vehicle is an improvement on the ordinary motor-quadracycle, in that the front and rear passenger are provided with comfortable seats. The frame is of tubular construction, and is fitted at the rear with a 4 h.p. vertical engine, having an air-cooled cylinder, and water-jacket to the explosion chamber and valves and running at a speed of about 1,600 revolutions per minute. The valves are so arranged that they can be readily withdrawn without interfering with any of the pipes. The ignition is electrical, the trembler being fitted on the induction coil and not on the motor. The water circulation is on the thermo-siphon system, the tanks being located on the rear sides of the body, and having corrugated exterior walls to increase the cooling surface. The engine drives the change-gear shaft through a friction clutch; two speeds ahead are provided, controlled by a single lever, while provision is made for the addition of a reverse motion when desired. The change gear is of the sliding type, spur-gearing conveying the power to the rear axle. Steering is controlled by the rear passenger through an inclined

The Belfast firm of Boyd and Co. naturally give prominence to their motor clothes in Irish frieze, notably a knee-cover motor coat which affords double protection for the knees against wind and wet. From the waist downward there is a lateral extension buttoning at the side, so that when seated in the car the wearer appears as if provided with a neatly-drawn rug over the knees. For walking purposes the extension is folded back and buttoned on the inside of the left skirt, out of sight—altogether an ingenious and happy idea. The "Cadogan" vest is also shown. This is made of a material known as "Eiderdon," and has a drop back to protect the loins. A Polar coat, as supplied to the members of the Nansen Polar expedition, is a conspicuous feature of Messrs. Boyd and Co's display.

Waterproofed garments of varied descriptions are exhibited by Messrs. Abbotts, where the Harris tweeds, eulogised by Lord Rosebery in a public speech a few months ago, are to be found made up into waterproofed coats and ulsters. Proofed with rubber and lined with woollen material, they afford a material which is admirably adapted for the comfort of motorists. Here, too, are silk oilskins made up into ladies' and gentlemen's coats

FIG. 25.—ALLDAY'S "TRAVELLER" VOITURETTE.

hand wheel. Two brakes are provided, one actuated by a pedal acting on the differential drum, and a hand-brake acting in both directions on the counter-shaft. Sufficient petrol and water can be carried for a run of 100 miles. A feature of the car is the small space it takes up, a consideration with many motorists. The over-all width of the car is only 3 ft. 7 in., while the length is 7 ft. 6 in. Complete, the little car weighs about 5 cwt., and can, it is stated, attain a speed on the level of twenty-five miles per hour. As its name implies, it is specially adapted for use by commercial travellers, many of whom are now, we understand, using them with considerable success.

A well-arranged show-case testifies to the full range of motorists' clothing made by Messrs. Anderson, Anderson and Co., Limited. waterproofed garments naturally forming the main factors of an excellent display. Here are new designs of cloaks, ulsters, etc., rendered absolutely waterproof, as well as impervious to the winds that prove so keen and biting when touring. Leather ulsters, coats, jackets, vests, leggings, etc., also attract attention, while the firm has not overlooked the claims of the growing numbers of lady motorists for raiment at once suitable and of pleasant appearance,

The oiled silk provides a flexible and pliable material, and one that will doubtless be appreciated by lady automobilists. Water proof aprons, hats, car covers, etc., are also shown at this stand, as well as leather ulsters, jackets, knickers, trousers, etc.

The house of Clement Rothschild makes a feature of the manufacture of motor-car bodies—turning them out, with the aid of improved machinery, in large quantities. Here they are represented by five *tonneaux*, one special type being a spider with two seats in front and a dicky behind. This is made of wood and sheet steel, and can be fitted with wood or steel wings with brackets. There is also a *tonneau* of wood and steel with moulded steel wings and a high door; a *tonneau* in wood and aluminium, and another in wood and steel, with a dismountable back.

Brampton Brothers, Limited, have developed their business in chains for motor-vehicles since the last Show, and a good selection of block and roller chains for automobiles is on view. They are now making chains for heavy waggons, as well as for light cars—a 4 in. pitch chain with a breaking strain of 26 tons, and a 3 in. one with a breaking strain of 20 tons being on view. Chain-wheels and cutters for milling the teeth of the same also find a place on this stand.

Automobile timepieces, watches, and chronographic speed indicators are on the stand of Messrs. S. Smith and Son, Limited, Motorists will be most interested in the registered speed indicator for recording speeds of from twelve to sixty miles an hour. The scale is arranged on five circles on the face of the instrument. On passing a milestone a winding button is pressed down, an

FIG. 26.—THE ALBION DOCTOR'S CAR.

operation which is again performed on passing another. To read off the speed attained it is only necessary to notice the number that is pointed to by the small hand, and then look upon the corresponding circle for the figure that the long hand denotes, which indicates the mileage per hour. The same arrangement has been adopted in combination with a chronograph watch, thus enabling a record to be made of observations taken during the different stages of a run. Messrs. Smith's automobile timepiece is too well known to need description on the present occasion.

Waterproof black and brown polishes for leather goods, and also a selection of enamels, form the main features of the stand occupied by the Nugget Polish Company, Limited, while elsewhere in the Gallery will be seen the specialities of the Chiswick Soap Company, consisting of Buttercup metal polish—a polish well favoured for cleaning the bright parts of motor-vehicles.

Among other aluminium goods on the stand of Mr. Robert W. Coan are castings of crank chambers, name plates, engine boxes, and gear cases for motor-cars, all cast in aluminium, of which metal Mr. Coan makes a special feature.

Several excellent specimens of printing and engraving are shown by Messrs. F. King and Co., George Newnes, Ltd., the Temple Press, E. Kenealy, Iliffe and Son, and J. and C. Cooper, the latter having some examples of designs for carriage work displayed on one of the walls in the Gallery.

A Scotch firm making its *debut* at the Exhibition is the Albion Motor Car Company, Limited, who have a couple of their Albion cars on view, one being a phaeton or doctor's car (Fig. 26), the other a *tonneau*. These vehicles are quite different in design to the majority of motor-cars, and comprise a number of special features, the object of the makers being to design a car easy of control, smooth in running and economy in working; and it must be admitted that they have fairly well attained their ideals. The engine, which, as will be seen from Fig. 27, which gives a plan of the vehicle, is centrally located, comprises two horizontal cylinders set opposite to one another, the piston-rods working on to cranks set at an angle of 180 deg. to each other on a central

shaft. The engine (Fig. 28) has cylinders 4 in. diameter by 5 in. stroke, develops 8 b.h.p. at a normal speed of 700 revolutions per minute, but by means of the accelerator this can be raised to 1,000 revolutions per minute, and the power of the engine and the speed of the car proportionately increased. It is fitted with an adjustable limit governor acting on the exhaust to prevent the engine racing.

The power of the motor at all speeds is controlled by means of a lever placed at the driver's right hand, which regulates the quantity of the in-going charge, thus ensuring perfectly smooth and economical running. All main bearings, including the crank-pins, are positively lubricated, splash lubrication being only depended on for the minor bearings. There is no water joint in the combustion chamber, while another useful feature is that the valves are very accessible, and can be removed without disturbing any piping. The water circulation is maintained by a pump driven off the crank-shaft by a belt, a radiating coil being also provided. The ignition is magneto-electric, on the low-tension system, the rotary armature of the device (Fig. 31) being mounted directly on the engine shaft. No batteries or accumulators are thus required, and only a single conductor runs from the generator to each ignition-plug. A modified form of float-feed carburettor is employed. In addition to the usual starting-handle the driver can, by means of a ratchet arrangement, start the engine from the seat. The power is transmitted through a leather-faced friction-clutch and a raw hide pinion on the engine-shaft to a spur-wheel on one shaft of the change-speed gear, which is enclosed in the casting below the engine. Spur-gearing, giving two forward speeds and one reverse, transmits from the first to the second countershaft in the gear-box. The change-gear is enclosed in an aluminium casing, and runs in oil, the changes of speed being obtained by special combination clutches, which make the operation very simple and silent (see Fig. 29). There are two forward speeds of thirteen and five miles per hour with the engine running at the normal speed. By using the accelerator these speeds can be raised to nineteen and seven and a half miles per hour respectively. The Albion Company consider two changes of speed sufficient, about 95 per cent. of the

FIG. 27.—PLAN OF ALBION CAR.

running being done on the high speed. A reverse speed of four miles per hour is also provided for backing. The change-gear is operated by a single lever, the change from high to low speed being made without releasing the engine clutch, which thus entirely does away with any risk of the car running backwards while changing speed on a hill. From the gear-box the power is transmitted by a chain to a short differential shaft. The rear axle, which is directly below the differential shaft, is practically in two

halves, each being driven by enclosed spur-gearing. The crank-case and the change-gear casing are in one aluminium casting. The whole engine, gearing, and mechanism are mounted on a frame of channel steel provided with fitch plates, to which are also fixed the springs and axles. The carriage body is entirely independent and is easily removable. Particular attention has been paid to the question of brakes. A pedal operates a neat form of block brake on the countershaft,

FIG. 28.—THE ALBION MOTOR.

from which the rear axle is driven. Referring to Fig. 30, A is the brake drum, which is keyed to the shaft B; the brake shoes are attached to the levers D E, pivoted from a bracket brazed to the tube C around the live axle. The shoes are normally prevented from pressing on the brake drum by a spring S on a bolt T, which passes through slots at their upper ends. The lever L, pivoted at R on the lever D, is connected at its upper end to the bolt T and at the lower end to a rod P, which is connected to the brake-actuated pedal. When tension is applied through the rod P,

FIG. 29.—THE ALBION CHANGE-SPEED GEAR.

the brake shoes are, by means of the levers, brought into contact with the drum, the brake acting equally well be the car running in either a forward or rearward direction. A hand lever at the side also operates shoe brakes, which press upon the solid tyres of the driving wheels. The oil tank holds five gallons of oil, this being sufficient to run the car 125 miles when fully loaded. The wheels are of artillery pattern, with hard-wood spokes, the front ones being fitted with 2-inch and the rear ones with 2½-inch solid tyres. Tiller steering is adopted, little or no vibration being

transmitted to the driver's hands, owing to the interposition of rubber buffers in the steering rod links. The car, which complete weighs about 18 cwt., is speeded up to a maximum of about 19 miles per hour, and will, it is stated, ascend the steepest of hills at a speed of 7 miles per hour.

The principal exhibit of the Streatham Motor Car Company is the Streatham *tonneau* car for four persons. The body of the vehicle is painted white with red lines, and has an attractive and comfortable appearance, the two front seats being of the arm-chair type. The motor, which is set in the fore-part of the frame,

FIG. 30.—THE ALBION BAND BRAKE.

is of the Cudell vertical two-cylinder type, developing 8 h.p. Electrical ignition is adopted, while the water circulation is maintained by pump and radiators. The cylinder diameter is 90 mm., with a stroke of 100 mm. The speed of the engine can be varied between 200 and 1,600 revolutions per minute by means of a centrifugal governor acting on the admission pipe. A hand accelerator is fitted in connection with the governor. Three speeds forward and a reverse motion are provided, the forward motion being controlled by a hand lever at the side of the car, the reverse being actuated by a heel pedal. The power is transmitted through a pedal-operated friction clutch to the change gear box, in which is a sliding train of pinions, and from the latter direct to the rear live axle by means of a universally jointed shaft and bevel gearing. The road wheels are of the artillery wood type, equal sized, and shod with 80 mm. pneumatic

FIG. 31.—THE ALBION MAGNETO MACHINE.

tyres. Inclined hand wheel steering is adopted, while there is a pedal-actuated band brake on the clutch shaft, and double-acting band-brakes on the hubs of each of the rear wheels, the latter being operated by a hand lever. To prevent the car running backwards on a hill, a ratchet arrangement is provided on the rear axle, in place of the ordinary sprag. The car weighs complete about 14 cwt., and on the level is claimed to be able to attain a speed of forty miles per hour. The Streatham Company also show a *voiturette*, somewhat on the lines of the De Dion *voiturette*, but fitted with a 6 h.p. engine. It has two speeds ahead and one reverse.

A new motor-bicycle (Fig. 32) is to be seen at the stand of the Aurora Manufacturing Company. The engine, which is of the air-cooled variety, developing $2\frac{1}{2}$ h.p., is supported vertically in the frame, just forward of the bottom bracket. Electrical ignition is adopted, with the trembler on the induction coil instead of at the side of the crank chamber. A Longuemare float-feed carburettor is employed to furnish the mixture for the

FIG. 32.—THE AURORA MOTOR BICYCLE.

motor, which drives the rear wheel by means of a twisted belt. The variable ignition and exhaust valve lifter are controlled by a single lever. The frame of the machine is of strong construction. A large tank is fitted, capable of holding $1\frac{1}{2}$ gallons of petrol, which is stated to be sufficient for a run of 100 miles. Lubrication of the crank chamber can be effected without dismounting by means of a pump within reach of the driver's hand.

The electric landaus of the Electric Landauet Company, Limited, are now quite a prominent feature of West End traffic. Three types are to be seen at the company's stand, one having accommodation for two persons, in addition to the driver and footman; one, built to the order of Madame Melba, the well-known operatic artiste, having seating accommodation for three persons inside; and one to accommodate four persons, built for Laura, Countess of Wilton. A replica of the latter vehicle, but painted in yellow and black, constructed for the Carlton Hotel Company, Limited, is also to be seen. The under frame of all these vehicles is of tubular construction, with special flexible joints to allow for uneven roads. Supported on this at the rear are two small electric motors, one at each side, pinions on the motor shafts gearing with internally-toothed wheels rigidly attached to the rear road wheels. The battery used as a standard consists of 44 E.P.S. accumulators. The distance that can be covered on one charge of the battery ranges from thirty-five to forty miles, according to the character and condition of the roads traversed. The controller is adapted to give three forward and two reverse speeds, the maximum speed in each case being from twelve to thirteen miles per hour. Steering is controlled by a tiller, while the driver has both foot and hand double-acting brakes under his command. The road wheels are of the artillery type, shod with solid rubber tyres, the company finding these quite satisfactory, having regard to the ample springs introduced between the carriage body and frame. Needless to say, the carriage work and upholstery are of the highest class.

Mr. Frank Morriss, who has long held a prominent place in the motor industry in the Eastern counties, makes a successful *debut* as an exhibitor at the Agricultural Hall. For some time past he has been making a speciality of the repair of Daimler cars, and of modernising old types of these vehicles by, among other things,

increasing the power of the early 6 h.p. engines up to 9 h.p. He does this by fitting new cylinders and pistons to the crank-chambers of the old engines, the cylinders being cast complete with their water-jackets in such a way that there is no water-joint. Whilst primarily intended for electrical ignition, the tube is still retained as a stand-by in case of necessity, and two neat lamp-cases are attached at either end. The induction and exhaust valves are of large diameter, whilst the exhaust space is much larger than in the old type, and is discharged straight away without passing round the head. Other items of interest at Mr. Morriss's stand are the gear sleeves with detachable third speeds in addition to the usual detachable fourth speed described in our issue of January 4th last; water-circulating pumps with Delta metal centres, and metal clacks, inlet and exhaust valves with cast-iron heads screwed on to the stems, the display being completed by a selection of motor-car bodies.

Motor-car houses and sheds are shown by Messrs. Boulton and Paul, Limited, who have already supplied large numbers of these for service in the Eastern counties. The principal example on view is a good design, 15 feet by 10 feet. This is intended to stand on a concrete floor, and the ridged roof is fitted with two ventilators, a glass skylight in the centre of one ridge and a window at one side of the house giving ample light. The shed is waterproofed, and seems well designed for its purpose. Smaller wooden sheds are also worth inspection at this stand.

A varied collection of tyres is assembled by the Diamond Tyre Co., the specimens ranging from those for the lightest types of voituresses to those for heavy waggons. There is also an assortment of "extra stout" single-tube Diamond tyres, in sizes from $2\frac{1}{2}$ in. to 5 in. diameter. The Diamond tyres for motor-cars have a layer of fabric covering that portion lying next to the edge of the rim, thus preventing rim-cutting to a certain extent. In the manufacture of these tyres the fastening bolt has been introduced into the rubber, as shown in the sectional drawing, Fig. 33, and a standard equipment of eight bolts is given the tyre, these being spaced alternately 40 and 50 degs. Variations, however, are made

FIG. 33.—THE DIAMOND TYRE.

in the cases of wheels for special vehicles, so that the principle of the Diamond tyre can be adapted to any size wheel. In addition to tyres a general assortment of steel crescent rims with flared edges for wire wheels, inflators, valves, repair outfits, and automobile sundries will be of more than passing interest.

Appropriately enough the Vacuum Oil Company, Limited, finds an early place in the catalogue, and a conspicuous one in the Exhibition. At a well-appointed stall is its representative collection of oils, greases, lubricators, &c., while its grease cups, oil filters, sight feed lubricators, and oilers make up an essentially utilitarian display. Four classes of "Mobiloil" are shown, No. 1 being for air-cooled engines of $1\frac{1}{2}$ h.p., and less, for water-cooled engines of the Panhard, Cannstatt-Daimler, M.M.C., Milnes, and similar types, with speeds ranging from 800 to 1,000 revolutions per minute. A dark lubricant for air-cooled engines of larger size than $1\frac{1}{2}$ h.p. is "Mobiloil" No. 2—an oil of good viscosity and high flash point, which is also adapted for engines of the Serpollet type. For water-cooled engines with speeds of from 400 to 800 revolutions per minute the Vacuum No. 3 "Mobiloil" is applicable; the N. variety is recommended for De Dion engines and those of the Serpollet type employing moderately-superheated steam. Special oils for various types of steam-cars and for heavy steam vehicles are shown, and owners of electrical cars will be interested in the company's "Electra" engine oil, which is claimed to give full lubrication at zero Fahr,

Mr. Argent Archer, the official photographer to the Exhibition, is known to automobilists as one who can give to matter-of-fact business appearances the glamour of pictorial effect. Hence his photographs of motor-cars are always artistic and interesting. During the Exhibition he has taken a series of photographs which will have permanent interest, not only as illustrating the stands of particular exhibitors, but also presenting a complete view of this highly successful display. Mr. Archer has a collection of photographs of cars for Royalty, as well as of all the historical incidents in connection with the development of automobilism during the last decade.

The *Motor-Car Journal* has a place at the stall at the entrance to the Exhibition, and also at the well-lighted stall on the right-hand side of the Hall, near the Post Office. During the week thousands of copies have been sold in the Exhibition, and the annual subscriptions which have been received have proved a record, when compared with the results of previous displays. All this accession of strength is gratifying—not only from the *Journal's* particular point of view, but also from the general interests of those who regularly use our advertisement columns.

Messrs. Rubery and Co.'s exhibit is of interest to those practically engaged in the manufacture of motor-cars. They show steel channel frames which combine lightness with strength, special prominence being given a light voiturette frame made of a very light section of steel channel. Specimens of channel sections, bent to every conceivable angle and curve, are also on view. The "Castle" lock-nut is an ingenious contrivance which enables a pin to pass through the top of the nut and thus hold it in place. This has a place on the stand, as well as bright and black steel bolts and nuts of all descriptions.

The Vulcan Motor and Engineering Company have on view one of their Vulcan voiturettes with belt and gear transmission. As this car was described and illustrated in our issue of March 22nd last, it is only necessary to mention that it is fitted with a 4 h.p. single-cylinder motor in the forepart of a tubular frame. The water circulation is on the thermal syphon system. Three speeds are available—two, eight, and eighteen miles at normal rate of engine, any intermediate speed being obtained by varying the speed of the motor.

At the stand of the Anglo-American Oil Company, Limited, the new list of agents for Pratt's motor spirit, to which we referred last week, can be obtained on application. Motor spirit is so familiar to all who are practically interested in automobilism that it remains but to be said that an improvement has been introduced into the sealed cans employed by the company since the last show. Then the screwed stoppers had bevelled edges, but these are now made with a straight cut, so that in opening there is no slipping of the instrument employed. Small holes, too, have been introduced, so that wiring can be effectually done, and an improvement thus made on the Government regulations.

Among firms showing for the first time at the Exhibition are Messrs. A. Russell and Co. They have an attractive display of well-designed lamps suitable for electricity, acetylene, or oil. Notable among the acetylene lamps for motor-cars is a new "Phare Bedford," which has already been adopted by several motor-car firms. Messrs. Russell and Co. have also a varied collection of ironmongery for motor-car builders, and are to be congratulated on their *debut* at these shows.

What is known as an "automobilists' umbrella" is shown by Messrs. O. Strom and Son. This is an ingenious arrangement which entirely encircles the wearer, completely protecting him from the heaviest downpour. It is really a long smock of water-proofed material with a deep collar of india-rubber, which draws closely around the neck of the motorist. The sleeves have wind-cuffs, and when seated the wearer is completely enveloped from

FIG. 34.—STROM'S MOTORISTS' UMBRELLA.

neck to heel. With headgear, as shown in Fig. 34, the whole device gives ample protection, and is, at the same time, easy and comfortable. A stylish coat, which can be easily converted into a suit with trousers when the motorist is away from his car, is on view, and there is also an apron similarly convertible. This is made in leather and fur. A complete assortment of fashionable clothing for ladies completes a display which indicates how comfort and protection from the weather can be combined with artistic effects, which show a considerable advance on the styles which were popular a few seasons ago.

A show of motor accessories is made by Mr. H. Waterson. These include radiators, pumps, steering wheels, sparking plugs, accumulators, induction coils, lifting jacks, etc.

The Mulliner Motor Body Company makes its first appearance at these Exhibitions with a selection of motor-car phaeton bodies—one with a hood and glass shield in front—in the Gallery. On some stands elsewhere, notably on that of the British Power Traction and Lighting Company, will be found other examples of the firm's coach-work, which is characterised by a fine finish. Here, too, are several artillery wheels, including a set of teak wheels destined for use in India.

Those motorists who are looking for a light motor-car for two persons at a popular price should not omit to inspect that shown by M. A. Bailleau. As we gave an illustration and description of this little vehicle so recently as our issue of January 25th last, it will now suffice to state that it can be had fitted with a $3\frac{1}{2}$ h.p. De Dion or 4 h.p. Aster water-cooled motor, and that there are two speeds provided. M. Bailleau also informs us that he is about to introduce a slightly higher-powered car on similar lines, with seating capacity for three or four persons.

Phaeton car bodies in plain wood are shown by Messrs. Peters and Buchanan. A similar type of body painted, lined out and varnished is also shown, the good workmanship being a notable characteristic of the display.

The system of index-filing introduced by the Shannon, Limited, is already so well known, and so generally adopted by commercial firms, that no lengthy description need now be given. Suffice it to say that the company shows a representative collection of their letter-filing cabinets, roll-top desks, and chairs, rapid roller letter copiers, and card index cabinets. These latter are now specially adapted for the service of motor-car manufacturers and repairers, and also for the proprietors of public service vehicles. Special cards are printed with the necessary rulings, so that particulars of repairs to motor-cars, the cost of running, etc., can be tabulated on separate cards alphabetically arranged and fitted into drawers, which form the sections of the cabinet. The idea is certainly readily adaptable to various purposes, and can be made to suit almost any business requirement.

Few trades have found such scope for new ideas in connection with motoring as the tailoring industry, and the present Exhibition reveals the artistic instincts, as well as the vagaries, which have been associated with the designs of suitable clothing for automobilists. A few years ago the evident intention of tailors was to design garments which secured warmth without regard to appearance, with the result that fantastic notions were responsible for some very ridiculous costumes. But now the general line upon which the trade seems to be going is towards securing an ordinary appearance combined with the requisite essentials as to the raiment being wind and rain proof. A good example of what we mean will be found at the stand occupied by Mr. T. H. Holding. Here is the "Ayrshire" motor ulster, which is designed both for ladies and gentlemen. This is really a

FIG. 35.—HOLDING'S MOTOR APRON FOR TWO PERSONS.

walking overcoat, so that a man may leave his car and not appear conspicuous when passing along the street. When seated on the vehicle, however, there is ample knee room, and it forms a freely-setting apron. A motor apron adaptable for one or two persons is also shown, as well as coverall smocks, a patent puttee knee for sporting knickers, a kangaroo leather vest fitted

with sleeves and wind cuffs, and leather garments of all descriptions.

A provisionally protected skirt apron of simple yet effective design is the leading novelty among several new notions practically demonstrated at Mr. Alfred Dunhill's stand. This is made of leather, and slipped on like a skirt, encircling the whole of the body downwards from the waist. Two stout elastic fastenings are provided to the upper portion, by which it can be securely and comfortably held to the person, so that it forms an impenetrable protection against wind and wet. A combined puttee

FIGS. 36 AND 37.—DUNHILL'S MOTOR OVERCOATS.

and leggings, which can be instantly released, is also shown, and the M.C. semi-knickers, specially intended for motor-cyclists. These take the form of overalls, and while they have the appearance of ordinary knickers to the observer, afford ample protection where most needed. They can be readily taken off or put on—an advantage that will be appreciated. Leggings and boot-covers—the latter lined with wool—chrome calf leather clothing, dust coats, gauntlet gloves, foot muffs, etc., occupy a large space on this stand, the interest of which is enhanced by a collection of sundries, including lifting jacks, collapsible cans and buckets, and other conveniences for motorists. In the gallery the *Motor Mart* is being displayed, thus giving publicity to another department of Mr. Dunhill's motoring interests.

A tyre-inflating pump which secures a constant stream of air and in which energy is not dissipated is a desideratum which has been introduced by Messrs. Hedley S. Hunt and Company. This was shown at the last Exhibition, since when it has been adopted by many well-known motorists. It is a compound foot-pump in which two cylinders—one of larger diameter than the other—are connected at the top by a cross-air channel. Two plungers are connected to a double handle, and fitted with collapsible leather valves working in opposite directions. The up-stroke compresses the air of the larger barrel into the smaller, at the same time expelling the air from the latter, so that the inflation of the tyre commences forthwith. The down-stroke expels the compressed air into the tyre, and at the same time the pump feeds itself through the larger barrel. In this way a pressure of 150 lbs. can be obtained. The pump is fitted with a pressure-gauge and non-returnable valve, as well as a collapsible foot, and is conveniently adjustable to any type of car. This is the sole exhibit on this stand, but it is proving of sufficient interest to attract a large number of visitors to that part of the Gallery in which its utility is being demonstrated.

(To be continued.)

EXHIBITION ECHOES.

A DEPUTATION from the Torquay Corporation visited the Exhibition on Wednesday, with a view to acquainting themselves with the present reliability of automobiles. A local agitation in favour of electric trams is proceeding, and the idea was to secure evidence as to the possibility of successfully inaugurating a motor-car service.

DEPUTATIONS from other towns have also attended the show to make inspection of the vehicles on view specially designed for municipal work.

AMONG the novelties at the Exhibition are several interesting exhibits unobserved by many in charge of stands, but discovered by enterprising newspaper men. One found "a Morse car, belonging to the Hon. C. Rhodes"; another a Bucket motor; and a third was interested in a "Sir Polly wagon."

Wednesday was a special day at the Exhibition, the visitors not only including a large representation of the Automobile Club but also many of the leaders in social and political circles. The Prince of Wales arrived at the Barford Street entrance about half past three o'clock, and was cordially greeted by many leading automobilists whose names are prominent in the motor world. In their company his Royal Highness made a tour of the Exhibition, evidencing a keen interest in the cars. His attention was drawn to the splendid array of British-made vehicles, of which he took particular notice. Among those who have attended the Exhibition during the week, and most of whom were present to meet the Prince on Wednesday, were the following:—Duke of Portland, K.G., Duke of Devonshire, K.G., Duke of Newcastle, Duke of Manchester, Marquis of Ailsa, Earl Grey, Earl of Shrewsbury and Talbot, Earl Denbigh, Earl Carnarvon, Earl Londonderry, Lord Llangattock, Marquis of Tweedmouth, Lord Derby, Lord Hillingdon, Lord Vaux, Lord Wemyss, Lord Kinnaird, Lord Harewood, Earl Russell, Mr. A. J. Balfour, Lord Willoughby d'Eresby, M.P., Lord de Grey, Viscount Ingestre,

THE NICE WEEK.—MR. LORAIN BARROW ON THE LOHNER-PORSCHE-MERCEDES COMBINATION PETROL-ELECTRIC RACING CAR.
[Automobil Zeitung.]

WHILE the firms that have stands at the Exhibition are doing good business, we are afraid one or two enterprising folks who are canvassing the various exhibitors, without being exhibitors themselves, are faring rather less successfully.

MR. A. L. CREYKE has purchased the Gardner-Serpollet car which recently made a kilometre record of 29 4-5 secs. An illustration of the car, which is on view on the Speedwell Company's stand at the Exhibition, appears on another page of the present issue.

THE opinion of the *County Gentleman*, that "the Agricultural Hall as a *locale* for the Exhibition is not an unpopular one," is being fully justified by the attendance. "It is not far distant from the termini of the principal railways, while the Hall lends itself to an effective display of exhibits," is another newspaper comment verified by the appearance of the Show.

Sir Hickman Bacon, Bart., Sir John Murray, Sir Rivers Wilson, Sir Mark Stewart, M.P., Mr. Cochrane, M.P., Hon. Arthur Stanley, M.P., Col. McCalmont, M.P., Sir Herbert Ashman, Mr. Gordon Bennett, Mr. Eric Chaplin, Countess Dysart, Countess de Grey, and the Hon. Mrs. Ridley. It will be seen that these ladies and gentlemen are not only prominent in our public life, but that many of them are also keen automobilists.

THE five Mercedes cars which took part in the Nice trials have all been sold. One has been acquired by Mr. Vanderbilt, Junior, and another by Mr. Wolf Bishop, two well-known American motorists. Prince Lubecki has purchased the third, Baron de Rothschild the fourth, while the fifth now belongs to Mr. Alfred Harmsworth, and is at present on view at the Exhibition at the Agricultural Hall where it is the centre of attraction. Mr. Harmsworth himself visited the show on Monday, and was not the least interested observer of the car.

SEVERAL cars were driven direct from the works of the makers to the Show, and thus from Guildford, Lowestoft, Reading, and other towns came effective road advertisements of new types of vehicles.

AMONG the meetings held at the Agricultural Hall, on Wednesday, were the annual meeting of the Motor Union and the dinner of the Automobile Club, over which Mr. Roger Wallace, K.C., presided.

THE KING'S NEW 22 H.P. DAIMLER, ON VIEW (IN INCOMPLETE CONDITION) AT THE EXHIBITION.

The *Referee* says:—"For the seventh year in succession at the Agricultural Hall, Mr. Charles Cordingley, who was one of the first to take an active interest in the 'horseless carriage,' has

THE *Free Lance* in the course of a description of the "Passe Partout," which arrived at the Exhibition on Tuesday, says "the seats turn up and make beds." We have heard of the

THE LOCOMOBILE AND TRAILER WHICH HAS BEEN USED IN THE TRANSVAAL WAR.—EXHIBITED AT THE AGRICULTURAL HALL.

organised a splendid exhibition of all that is thoroughly up to date in the motor-car world. The show, which was opened at the great Islington Hall, eclipses all its predecessors."

automobile kitchen and the mechanical stoker, but the seat that can turn up and make beds is a novelty which Maple or Shoolbred should take up at once.

OWING to the enterprise of the Hemel Hempstead Motor-Car Company, parties of local people interested in automobilism have come to the Exhibition from that town on motor-cars, a capital combination of practice with theory.

AMONG the rumours current at the Exhibition is one to the effect that some developments may shortly be expected with regard to the sale of the Mercedes Simplex cars of the German Daimler Company in this country.

Now that the essential parts of motor-cars are being made increasingly reliable makers are attending to the smaller matters which, however insignificant, go to make easy the experiences of the automobilist. Thus two or three cars shown have the brake pedals covered with leather pads to protect the sole of the driver's boot, and others have short rails by which the intending passengers can pull themselves up to the seat of the car, thus saving the wear and tear that is associated with the continual grasping of the leather in many cases. This friction quickly renders the upholstery in a prominent part of the car

One or two even grew bolder in their freedom, and we hope it was not an act of disloyalty that caused one perky little fellow to perch awhile on the King's car.

AMONG the many visitors to the show on Saturday were the Duke of Devonshire, the Duke of Manchester, and Mr. A. J. Balfour.

SEVERAL splendid photographs are shown on several stands, that of the workmen of the *Carrosserie Industrielle* being a conspicuous example of photographic art. The Hon. C. S. Rolls has two albums which will recall some interesting reminiscences and the Locomobile Company have also a collection of photographs deserving a careful inspection. Of varied interest—especially to those familiar with continental automobilism—is the collection shown by Madame Lockert.

ON Saturday night there was a great influx of provincial visitors to the Exhibition, and hundreds of people who had come o London for the final for the English football cup spent a few

M. SERPOLLET ON THE STEAM CAR ON WHICH HE COVERED ONE KILOMETRE IN 29 4-5THS SECONDS AT NICE. THE VEHICLE IS THIS WEEK ON VIEW AT THE AGRICULTURAL HALL.

unsightly, and can easily be obviated by fitting a short rail or a leather band covered with a textile to match the upholstery, as is done in the case of many types of horse-drawn vehicles.

ONE firm was in dire distress on Saturday, several large parcels with which it had been intended to make a good display having gone astray—the railway company blaming the increased excursion traffic for the delay. Possibly at some future Exhibitions firms near London will avail themselves of the motor-car for the delivery of their goods. Several vehicles were sent up by road, but probably the funniest incident of the week occurred on Sunday, when a vehicle arrived towed by a horse of sturdy proportions. It may be sad to reflect on an automobile being thus reduced to the status of a common barge; but to observe the actual entry in such a condition is, at least, amusing.

ON Sunday the Agricultural Hall presented an unaccustomed sight to the firemen and other attendants in charge, for most of the stands were well covered, elaborate precautions having been taken in many cases to shield the vehicles from the dust. So far as the galleries were concerned the only moving things were a dozen sparrows, which flitted from pillar to post as though endeavouring to make the most of the only quiet day of the week.

hours in the Agricultural Hall before proceeding to the railway termini at Euston, Liverpool Street, King's Cross, St. Pancras, and elsewhere for their return journey. Thus they demonstrated that if the Hall is convenient of access it is also handy for the late trains from London—a point which will always give the present *locale* an advantage over any other site in or near the Metropolis. Some of those who travelled at a slow and doleful pace from the Crystal Palace must have been delighted with the speed and comfort of the newly-opened line from South London to the Angel at Islington.

As to the value of the cars in the Exhibition during the week one daily journal estimated it at £250,000—a sum considerably below the mark, as is evidenced from merely totalling the value of the vehicles staged in the Great Hall.

MANY lovers of horses have been among the most interested visitors, and among the early arrivals on Saturday was Sir Walter Gilbey, whose efforts in connection with the breeding of horses are recognised throughout the kingdom.

MOTORING firms are not entirely unmindful of the equine world and at the stand of the Shrewsbury and Challiner Tyre

Co., Ltd., are specimens of a horse shoe ventilated cushion pad, which is calculated to save horses from much suffering when pulled up suddenly.

THROUGHOUT the week the long string of carriages assembled around Islington Green and right along the Upper Street has been a noticeable feature of the traffic, several policemen having been necessary to regulate the rows of fashionable carriages that have lined the roadway. Here and there a motor-car was standing behind a horse drawn vehicle, but the number of automobiles was rendered apparently insignificant by the great number of other carriages in which visitors have come to the show.

SUCH was the impression gleaned by a correspondent who has seen most of the Show from the Islington side; at the Barford Street entrance, however, a far different complexion is given, for there motorists drive up on their motor-cars, and horse-drawn carriages are the exception. Quite a score of automobiles are often to be seen in the narrow thoroughfare at one time.

In conversation with exhibitors, we have found a remarkable unanimity with regard to the good business done. Not only have orders been plentiful at the Show, but it is clear that most of the factories are as well employed as they can possibly be.

HERE AND THERE.

A RACE for motor-bicycles is to be held at Wishaw, N.B., on May 3rd.

MOTOR-LORRIES are being employed in Portuguese South Africa with success.

WE learn that Major-Gen. Sir Henry Colville has purchased a Holden motor-bicycle.

PRATT'S motor-spirit is now being stocked by Mr. P. Hebden, 133, Woodhouse Lane, Leeds.

THE members of the Motor Cycling Club held a run to Godalming on Sunday last.

SIR JOHN MURRAY, K.C.B., F.R.S., has, we hear, lately ordered an 8-h.p. Albion car.

THE 1902 trials in connection with the Automobile Club have been definitely fixed for the week commencing September 1st.

THE Wilson Premium for papers read before the Crystal Palace School of Practical Engineering has been awarded to Mr. G. de Havilland for a paper on motor-cars.

AN instrument prepared by Mr. R. E. Phillips for the electric timing of races will be used in connection with the trials at Bexhill on Whit Monday. Motor-cycles, as well as cars, will be included in the programme.

CONFIRMATION of our recent statement with regard to M. Santos Dumont's summer plans comes in the announcement that the Aero Club has arranged that his first trip from the Crystal Palace will take place on June 2.

A SERVICE of electric motor-omnibuses on the Lombard-Gerin system is being established in Copenhagen. In this system the cars run on the ordinary road, but take the necessary current from an overhead-conductor, similar to a trolley tramway.

THE John Simmons Company, of 106, Centre Street, New York, have devised an instrument called a "Tell-Tale," for determining the exact amount of petrol in a tank, whether under pressure or not. The contents are registered in gallons, the number of which is at all times clearly visible through a heavy glass dial. That element of doubt and uncertainty when operating a steam-vehicle, as to just what amount of petrol the tank contains, is, by this device, claimed to be entirely eliminated. The apparatus can be adjusted to any tank by simply cutting an opening $1\frac{1}{4}$ in. in diameter through the top, inserting a ball and rod, and soldering a flange to the wall.

THE Bexhill Motor Company, 27, Sackville Road, are making arrangements for the convenience of motorists staying at the seaside resort at Whitsun.

LIEUT. BARRON, of Taplow, who has been serving in South Africa with the active service company of the Bucks Volunteers, has recently become a motorist.

IN connection with the bazaar that is being organised on behalf of the Great Ormonde Street Hospital (London), a Daimler 12 h.p. car will be the first prize in a great raffle.

AMONG the entertainments to be offered to the Colonial Premiers when in England is an excursion by automobile. The British Empire League is interesting itself in the matter.

THE Great Central Garage, Limited, has been registered with a capital of £1,000 to carry on the business of garage proprietors. The registered office is at 302, Marylebone Road, W.

THE Hon. J. Scott Montagu, M.P., will allow the cars of members of the Automobile Club driving to the Solent to witness the Naval review to be stored in some of the buildings on the Beaulieu Estate.

THE twenty-third annual amateur race meeting and athletic sports of the Chichester Cycling Club, to be held in the Priory Park, Chichester, on Whit Monday, May 19th, will include a three miles motor-cycle handicap.

THE Antwerp Automobile Club is organising a series of kilometre trials for the 4th prox. The trials will be held on the military road between Mortsels and Borsbeek, and will be open for motor-cycles, voiturettes, light cars, heavy cars, and steam and electric vehicles.

AFTER all it appears that the tenancy of the Whitehall Court premises cannot be terminated by the Automobile Club until November. The premises will therefore be sub-let—probably for use as a ladies' club—and entry made of 119, Piccadilly, about May 1st.

MR. M'CRUM, of Armagh, has introduced two steam vehicles of the Thornycroft type for dealing with the heavy traffic to and from his company's mills. Between the new motor-vehicle, Lambe's traction train, and the passing backwards and forwards of the County steam roller, the roads around Armagh should be improved.

WE understand that the Thornycroft Steam Wagon Co. have submitted designs to the Explosives Department for a heavy steam vehicle specially designed for the conveyance of gunpowder. The design has met with the approval of the Department, one of the conditions, however, being that only anthracite coal or coke shall be used as fuel.

NEW members of the Automobile Club include Lord Elphinstone, Major Lord C. Cavendish-Bentinck, D.S.O., Sir John Murray, K.C.B., Major-General H. E. Colville, K.C.M.G., Vice-Admiral Sir J. Fullerton, C.B., Mr. D. C. Thompson, J.P., D.L., Capt. D. H. Morgan, Professor A. K. Huntingdon, and Mr. J. Hargreaves, the master of the Blackmore Vale Fox Hounds.

MESSRS. JACOB LOHNER AND COMPANY, of Vienna, are now building three types of Lohner-Porsche combination petrol-electric cars on the lines of that recently illustrated in the *Journal*. One is fitted with a two-cylinder petrol motor of 11-h.p., another with a four-cylinder motor of 20-h.p., and the third with a 30-h.p. Mercedes-Simplex motor. The illustration on page 154 shows the Lohner-Porsche-Mercedes combination racing car driven by Mr. Lorain Barrow at the recent Nice meeting.

THE Hart Accumulator Company, Ltd., of Marshgate Lane, Stratford, E., is placing on the market an entirely new form of accumulator intended for use with electrical motor-cars, and which is stated to be lighter and cheaper than any other cell adapted for such work. The Hart Company has been experimenting for several years with cells for motor work, with the result that one has now been produced which combines mechanical strength with electrical efficiency, and in addition to light weight and high capacity extreme durability is claimed for it. The cells are made in three sizes, of 80, 120 and 160 ampere hour capacity, and weighing 17, 24 and 33 lbs. respectively. The normal charging rate for a cell of 120 ampere hour capacity is 18 amperes, although it will safely stand being charged at 24 amperes. The discharge rate of the same sized cell varies from 12 amperes for ten hours to 27 amperes for three hours, or 33 amperes for two hours.

THE Automobile Club of Westphalia has just been formed, with headquarters in Bielefeld.

WE learn that Messrs. De Dion, Bouton and Co. are about to open a branch depot at Buenos Ayres.

DURING the month of February automobiles and parts to the value of £6,900 were exported from the United States.

It is announced that Baron de Crawhez is making arrangements for a tour round Belgium by the members of the Belgian Automobile.

THE Automobile Club of America is seeking to find a level stretch of road two and a-half or three miles long for speed trials and racing purposes.

THE Belgium Automobile Club is organising a series of kilometre trials, which will probably be held on the road between Namur and Bastogne.

THE influx of French and German automobiles through the U.S. Custom House in New York continues unabated, and has reached the rate of three vehicles per day.

ARRANGEMENTS are being made for the sales of the "New York" tyres by the Motor Accessories, Limited, which will also have the agency for the Midgeley tubular wheel.

IN an article on "Players at Play," in the current number of the *Royal Magazine*, are portraits of Miss Margaret Fraser and Miss Ethel Matthews on their respective motor-cars.

THE Automobile Club of America has resigned its control of automobile racing in the United States to the American Automobile Association.

WE understand that Mr. L. Williamson, the well-known motorist, has just placed an order through Mr. G. H. Bechtel, of Lord Street, Southport, for a 22-h.p. Daimler car of the latest type.

THE B. F. Goodrich Company and Single Tube Tires Limited, have sent us a copy of their 1902 Showcard "Ruth," which is undoubtedly one of the most artistic advertising mediums we have so far received.

THE Locomobile Company of America have brought out a complete catalogue of their vehicles, printed in Spanish, for circulation in Spain and Spanish-speaking countries in South America.

THE Porto Rico Transportation Company, which is about to establish and operate a motor-bus service between San Juan and Ponce, has also submitted a tender for carrying the mails between these points.

THE Lincoln Motor Car and 'Bus Company was finally wound up on Monday. After paying all accounts it was found there was a small balance in hand, which will be distributed to the shareholders.

A TELEGRAM has been received at the Foreign Office from H.M. Commercial Attache in China, to the effect that tenders are being invited until June 30th next for a service of automobile omnibuses at Shanghai.

J. W. AND T. CONNOLLY, LTD., has been registered with a capital of £125,000 to acquire the business of tyre smiths, wheelwrights, etc., carried on by Mr. J. Connolly at 65, Wharfedale Road, King's Cross, N.

THE *Auto-Velo* states that Signor Carlo Rezzonico, a well-known Italian automobilist, who has just made the tour of Europe, is completing his preparations for a motor-car excursion to the Arctic regions.

IN the annual report of the Continental-Caoutchouc and Guttapercha Company there is an item of 44,143 marks for patent expenses, 40,000 of which are for a tyre patent which the directors think will be a profitable one.

THE Union Motorfahrzeugfabrik of Nurembourg, Germany, are about to inaugurate a public service of motor-cars between that town and Heroldsberg. The vehicles, which have been constructed by the Union Company, have accommodation for eleven passengers.

TO-DAY (Saturday) an auction sale of twenty motor-cars, including the remainder of those which belonged to the Edinburgh Autocar Co., Limited, and some belonging to the Scottish Motor Car Co., Limited, will be held at Edinburgh.

It is the announced purpose of the Runs and Tours Committee of the Automobile Club of America to use every endeavour to put a stop to excessive speeding on Club runs. A member of the Committee will take part in every official run and act as pacemaker.

MR. W. K. VANDERBILT, JUN., has achieved the notable performance of driving his Mercedes car from Monte Carlo to Paris in seventeen hours. The distance is 1,030 kilometres, and the journey was made at the average rate of about thirty-eight miles an hour.

UNDER the name "Accelerator," Messrs. Edward de Poorter and Company, Limited, are introducing a new belt dressing for the belts of motor-cycles. It is a non-chemical preparation for preventing slip; it is claimed to preserve and add greatly to the life of the belt.

THE American Motor League has been formed, with Mr. E. F. Brown, of Chicago, as president, Messrs. C. E. Duryea, Reading, Pa., W. F. Murray, Detroit, and S. W. Merrihew, Detroit, as vice-presidents, Mr. F. B. Hills, of Boston, treasurer, and Mr. F. A. Egan, New York, secretary.

THE President of the Automobile Club of America announced at a recent meeting that an endurance test over a course from New York to Boston and return would be held next autumn. With return trip the journey extends to more than 500 miles, and is expected to take five or six days.

SELANGOR, a State of the Malay Peninsula, has already a notable collection of automobiles. There is a motor-bicycle, two motor-tricycles, an Albion car, four Locomobiles, two De Dion cars, and a Thornycroft steam car, so that automobilism may be said to be fairly established in the State.

AMONG newly-invented air-ships is one designed by Mr. Gustave Whitehead, of Bridgeport, Conn. This rises from the earth by means of power supplied by a 20-h.p. engine. Mr. W. C. Horgan, of Chicago, has not only floated an airship, but also a company—the latter with a capital of 25,000 dollars. A third invention which has lately attracted notice in the United States is that of Mr. Mytton, who has brought petroleum spirit into the service, using a small engine of light power.

FROM Messrs. Phillips, Ormonde and Company, Melbourne, Victoria, we learn that at a meeting of the Essendon Town Council recently it was announced that a Mr. A. C. Aucher was prepared to run a line of motor-cars from Melbourne to North Essendon and also to Ascot Vale. The terms of the agreement were that Mr. Aucher should deposit £400 as a guarantee to run a line within eight months, the Council undertaking not to introduce omnibuses, cabs, or tramways for ten years.

THE balance-sheet of Messrs. A. W. Gamage, Limited, has just been issued, from which it appears that the turnover for the year ending January 31st, 1902, showed an increase of £40,000 over that of the corresponding twelve months. The net profit, after payment of fees, and making provision for depreciation, amounted to £11,100. The directors mention that the new buildings now in course of erection in Leather Lane, E.C., are likely to be of great advantage to the business, and the increase in trade for the first three months of the current year amounts already to £5,000, so that a good year for 1902 seems assured.

SOME time ago we reported that a motor-car factory was to be established at Burton-on-Trent. The Ryknield Engine Company, Limited, has now been formed with a capital of £30,000 (of which £20,000 has already been subscribed privately) to erect works which will be on a site adjoining the Midland Railway main line at Burton. Building operations are to be commenced forthwith, and it is hoped to be able to deliver cars early next year. The intention is to standardise all the work and turn out large numbers of automobiles of one or two identical types.

CONTINENTAL NOTES.

BY AUTOMAN.

NOTWITHSTANDING all the trials to which the French and Italian Governments and the bad weather combined subjected the Nice automobile races, some Continental manufacturers have reason to be more than satisfied with the results, and have already begun to reap a good harvest, due entirely to the publicity given to them by competing successfully. Mr. Leon Serpollet has received a crop of orders which will keep his works busy for some time to come. By the way, he estimates that his record-making car developed nearly 130 h.p. during the

Mr. ARTHUR GARANDEAU, writing to the *Chasseur Français*, remarks that with the speed at which the motor-car is able to travel nowadays it is quite necessary that there should be indications along the roads by which the motorist can tell in a measure what he is coming to, and thus avoid dangerous speeds owing to the local contour or conditions. He proposes signposts of different colours, each separate colour having a distinct signification, as, for instance:—White, right ahead; black, go gently; red, danger; blue, sharp turn; yellow, caution, cross road with much traffic; green, blow your horn. Thus, for instance, at the entrance to a village there would be a black post to warn the motorist to slow down, and a little further on a blue and green post would give warning of a sharp bend in the road hidden by

THE CARS ON EXHIBITION AT NICE.

THE HEAVY VEHICLE TRIALS.—THE ARRIVAL AT NICE.

MADAME LOCKERT INTERVIEWS M. RENÉ DE KNYFF ON THE NEW PANHARD RACER.

M. DEGRAIS ON THE NEW MERCEDES SIMPLEX 40 H.P. RACER.

THE NICE WEEK.

fastest portion of the kilometre. As the wind pressure develops in increasing proportions, and at over sixty miles per hour reaches a very high figure indeed, it is quite certain that a very big power was required to propel his vehicle at nearly 75 miles per hour. Mr. Serpollet gives the figures as follows: Four single-acting cylinders of 75 millimetres in diameter (2.95 inches), with a stroke of 90 millimetres (3.53 inches), speed 1,220 revolutions per minute, and pressure reaching 53 atmospheres (795 lbs. per square inch). Another maker who has no reason to regret the expenses he incurred in preparing for the Nice meeting is Mr. Jelinck, the proprietor of the Mercedes car, made by the Daimler Company at Cannstatt. The five racing cars were sold, the prices paid being quite in proportion to the means of the purchasers.

houses, and before reaching it the driver would have tooted to clear the way. In the middle of the village a yellow and green post would give the necessary warning of a street crossing much frequented, and again the driver would toot his horn to warn the passers-by. After clearing the village a white post would give notice to the driver that he might "let her go," and he would keep on until a red post warned him of a dangerous spot, and so on.

THE delivery of telegrams by motor-tricycles is the latest development from Bordeaux. The suburbs are about to be served in this intelligent manner. Should the motor go wrong the telegraphist will have recourse to his calves. He will also be able to find a bicycle at various depots in case of need.

THE French Government is flogging a dead horse in trying to make alcohol take the place of petrol as a carburant for motor-cars. Nobody uses alcohol. It is, however, a good stalking horse, and comes in nicely for electoral purposes, sounding well in talking to the agricultural voters. After all, it looks as if it were going to save road-racing, which has undoubtedly received a very hard knock from the action of the Italian Government. The Governmental alcohol race (the "Circuit du Nord") I have already called attention to, and I also told the readers of the *Journal* that there was a strong probability of the Paris-Vienna race being authorised by the French Government after the Parliamentary session was terminated. I understand that it has been decided by the Government unofficially that at least one other race beside the "Circuit du Nord à l'Alcohol" shall be authorised, and it is a question between "Paris-Vienna" and "Paris-Bordeaux."

THERE was some exciting automobile racing on Sunday last on the road from Chartres to Ablis, about 36 miles from Paris, in what is known as the millionaires' contest, the millionaires being Baron Henri de Rothschild and Mr. W. K. Vanderbilt, junior. They in turn covered the kilometre in 28 seconds, says the *Figaro's* correspondent, six kilometres in 3 min. 14 sec., and finally Mr. Vanderbilt beat the ten kilometre record. The Baron, however, had a slight accident with his car, so the ten kilometre race is to be run again instead of the hundred kilometre race, which was originally fixed but has since been annulled.

MESSRS. BOTWOODS have lately completed a handsome Gobron-Brillie car, with double-phaeton body, to the order of Sir Charles Stewart Forbes.

M. L. BLERIOT, of Paris, the maker of the well-known Bleriot acetylene lamps for motor-cars, has now opened a depot at 54, Long Acre, London, W., for the sale of these extensively used light-givers in this country.

AMONG the Society leaders who have lately been shopping and motoring in Bond Street, W., is Lady Helen Stavordale. On Tuesday the Countess of Gosford drove through with a daughter in her motor-brougham. The motor-car is certainly becoming popular in the West End as a vehicle for use on shopping expeditions.

MOTORING columns in the general newspapers are rarely of value, but are frequently amusing. We have often noted that the writers of the notes in the least important papers generally give the largest numbers of answers to correspondents who write from the most distant papers—and in most alarming numbers. Of course, none of these correspondents are imaginary.

As we go to press we have received from the Wolseley Tool and Motor Car Company, Limited, an advance copy of an instruction book that has just been issued. Great pains have been taken to make this a thoroughly comprehensive treatise of the Wolseley motor-vehicles, illustrations for the same having been specially prepared from drawings. The cover has been made of a material both water and oil proof, and is so arranged as to entirely protect the contents of the book from injury or being soiled even if it be kept in the tool kit belonging to the car.

MESSRS. BRANSON, KENT AND COMPANY, LIMITED, 332, Goswell Road, E.C., have favoured us with a copy of the new list of their motor fittings, which should be useful for reference. Particular attention may be drawn to the very complete section devoted to horns, lamps, reservoirs, and tyre pumps, as well as tremblers and sparking plugs. The Branson motor watch is also illustrated in the catalogue, and being guaranteed water and dirt proof, should prove popular for use on long tours. Messrs. Branson, Kent and Company have every facility for all kinds of repairs to motor-cars, while at their own factory they are able to make any parts to pattern, an advantage which should be appreciated.

GLASGOW TO LONDON.

WE have already recorded the initial stage of the trial from Glasgow to London organised by the Western Section of the Scottish Automobile Club. This was intended to demonstrate that it is possible to revive the glory of the old coaching days and to journey by road from the great Scotch and English centres in a reasonable period. It was arranged that the trial should extend over two days, but this record will probably be beaten ere many months have passed, and we may shortly be able to announce an attempt to reach Glasgow from London, in one day.

On Thursday of last week a start was made from York to London, the Napier, driven by Mr. S. F. Edge, leaving the ancient city at 5.10 a.m., and reaching its destination at 4.55 p.m. Mr. J. W. Stocks, on the 8-h.p. De Dion phaeton, arrived at 5.12 p.m., and Mr. G. Iden brought the 8-h.p. M.M.C. wagonette safely through at 8.30 p.m. The roads were uniformly in good condition, but about thirty miles from London a good deal of dust bothered the drivers somewhat.

The marks, out of a maximum of 100, awarded the cars which came successfully through the ordeal were as follows:—

8-h.p. De Dion phaeton ...	86
8-h.p. M.M.C. Wagonette ...	74
16-h.p. Napier car ...	68

The last-named car was sometimes running for half an hour at a time on the low speed and for many hours together on

MR. J. W. STOCKS, ON THE 8 H.P. DE DION CAR WHICH SUCCESSFULLY MADE THE JOURNEY FROM GLASGOW TO LONDON LAST WEEK.

its second, so as to get within the speeds set out in the conditions of the trial. Such a state of things is, of course, the reverse of economical in working. Even then, however, the consumption of petrol by the four-cylindered 16-h.p. car was but 16½ gallons of petrol—or a little less than a gallon per hour. The engine required no attention on the run owing to the efficiency of the automatic lubricating arrangements. The low consumption of petrol on the journey was due to the throttle regulation preventing more than the proper amount of petrol necessary to give the requisite power to keep the car running being set free.

JOSEPH LUCAS, Limited, of Birmingham and London, have issued a new catalogue of their "Motoralities."

MR. J. B. DUNLOP, the inventor of the pneumatic tyre which bears his name, has ordered a 2-h.p. Progress motor-bicycle.

THE first run of the Irish Motor Cycling Union starts from Gough Statue, in the Phoenix Park, Dublin, on the 26th inst., at 3 o'clock. The run is only a short one to Bray, where a smoking concert will wind up the proceedings.

CORRESPONDENCE.

CRACKED WATER JACKETS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent W. B. asks about repairing a cracked water jacket. Mr. Smith writes, giving particulars how this can be repaired; but it is quite possible the crack is situated where it is difficult to repair as he suggests, or if it is done the vibration would probably make a leaky joint. I have repaired pumps and pipes on large steam engines, including road locos, in this way (when it has been difficult to patch) viz.:—Jacketing the whole castings in one of the white alloys or brass; the former will do in most cases, and would in this. Have the part or the whole casting moulded in sand and allowance made on casting (thickness of jacket) $\frac{1}{4}$ in. or $\frac{1}{2}$ in. with plaster of Paris; after moulding, remove the plaster and place the part in the mould, turn the alloy round it; this will be found very simple and inexpensive. I have tried it for years, and it has never failed to my knowledge.—Yours truly,

WM. WARD COOK.

HOW TO SELECT A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "Perplexed's" letter in the *Journal* of April 12th, regarding the question of "How to Select a Motor-Car," I note that he states that he has had great difficulty in getting information about a car from anyone in the trade, and that he wanted a car which is a good hill climber. A few months ago I made up my mind to purchase a new car to replace my old one, and, like "Perplexed," I required a really good hill-climber. After making inquiries from various agents, I came to the conclusion that a 6½-h.p. Gladiator light car would suit me, and on writing to the agents, I found them most willing and anxious to give me full information about their cars. Being unable to get to London myself to try the car, I arranged for a friend of mine to do so. The trial run was to Hampstead Heath and back, and included the ascent of Netherall Gardens with four passengers up; this the car successfully performed, and I purchased one forthwith. Since I got the car it has given me every satisfaction. I have not the slightest interest in that firm, but I can testify to the exceedingly fair way in which they treated me, going so far as to offer to send a 6½-h.p. Gladiator to Scotland, and if it failed to go up any of the hills in this district the company would take the car back to London free of all cost to me.—Yours truly,

JOHN CUNNINGHAM.

FINANCIAL INTERESTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the last issue of the Automobile Club's Notes and Notices that "a member of the Club is financially interested in the Hotel Metropole, Bexhill, and has expressed the hope that members may see their way to make use of this hotel." May I express the hope that that member—or the company owning that hotel—will contribute to the propaganda funds of the Club? One good turn deserves another.—Yours, etc.,

NON-TRADER.

A SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is a combination petrol-electric car being made; why not a combination air engine and petrol or petroleum engine air compressor to drive same, and get all the advantages of both steam and explosion engines? Any heat lost by compressing the air could be replaced by the exhaust from explosion engine encircling cylinders of air-compressing engine. Down-hill the air engine might be made to compress air instead of otherwise retarding speed. A Locomobile car, with explosion engine and air pump instead of a boiler, would be the idea.—Yours truly,

W. H. R.

A WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following information may be of use to your readers:—The police in the district of Brentwood and Ingatstone are in telephonic communication and time every car passing through between these points, and if the legal limit is exceeded, a summons follows.

A few days since I underwent the ordeal, a policeman coming forward at Ingatstone with smiles, seeking to know the name and address of my driver and my own as owner, as I had exceeded the legal limit. I may mention that between the two points the road is almost free from traffic and very broad. I need hardly say that I shall never spend another penny in this part of the country again.—Yours faithfully,

A MEMBER OF THE A.C.G.B.I.

THE LIABILITY OF SELLERS.

At the Brecon County Court, Godfrey Williams, of Aberpergwm, Glyn-Neath, sued Nott and Company, Limited, Brecon, for £11 4s. as damages. Mr. Randall opened the case at some length, and claimed that the defendants were liable under Sub. Sec. 1 of Sec. 14 of the Sale of Goods Act, 1893.

Plaintiff stated that he bought a motor-car in September of last year from Hurst and Lloyd, London, who also supplied him with the petrol and oil for lubricating purposes. After ten days the oil ran out, and he went to Brecon for the purpose of obtaining some more. He called at the defendant's shop, and asked for a lubricating oil with a high flash point for the cylinders of his motor-car. One of the assistants said they did not keep it, but when he remarked that he understood that Messrs. Nott were agents for motor-cars, and that they sold oil, another assistant said "We do keep it." Plaintiff asked if it was the right kind of oil, and the assistant replied in the affirmative. Plaintiff told the assistant that he required a mineral oil. He asked to be allowed to see the oil poured out, and the assistant invited him to the cellar. He was shown some oil, and he told the assistant that it looked something similar to what he had used before. He bought half a gallon and when on his journey in the direction of the "Storey Arms" he used some of the oil in the machine. He was on his way to Maesteg, and when about two miles out of Brecon he noticed that the machine was smoking. When going down an incline the machine suddenly stopped, and he was nearly thrown out. He found the cylinders had seized. After some time he got the machine to work, and drove back into Brecon. He went to Nott's shop, and asked to see a mechanic who had previously been with him at Gilestone. Together with the mechanic he started again to drive towards the "Storey Arms," and once more the machine broke down. It struck them that the cylinders required lubricating, but on examination they found there was sufficient oil for the purpose. After about an hour's work they got the machine to go, and came back to Brecon and on to Gilestone. Here he found that the machine was emitting clouds of smoke, and as he felt there was something wrong he sent for the makers, and Mr. Lloyd, one of the heads of the firm, came down. Plaintiff further stated that he called upon Messrs. Nott some time afterwards, and the head of the firm, after some conversation, told him that they could not hold themselves responsible for the action of their shopman. He replied that if that was the view they took of it he would certainly sue them.

In the course of the evidence Lewis Lloyd, of Hurst and Lloyd, said plaintiff showed him some of the oil supplied, and, although he was not an expert in oil, he could see that it was ordinary bicycle lubricating oil. He tried the engine with some of Messrs. Nott's oil, and it emitted volumes of smoke. He then had it cleared out, and put some of his own into it, with the result that the engine worked all right. He repaired the machine temporarily, but he afterwards had the axle sent up to London to have it permanently repaired. The injury to the machine was caused by the sudden seizing of the cylinder due to bad lubrication.

For the defence David Parry, an assistant of Messrs. Nott's establishment was called. He stated that he remembered the plaintiff coming to the shop and asking for lubricating oil. Witness attended to him, and took him down the cellar. Witness first poured out some olive oil, which was suitable in some cases for lubricating purposes, but the plaintiff said it was too expensive. Witness then poured out some gas-engine oil in a measure. The tank in which this oil was kept was marked "gas cylinder oil." Plaintiff took the oil to the window, and, looking at it, said, "This is just the thing I want." George Nott said the sample of oil produced was a fair sample of the oil supplied to the plaintiff. It was supplied to his firm by the Anglo-Bosporous Oil Company. The oil supplied the plaintiff was a mineral oil with a flash point of 405. Price's Motorine (C) oil was similar in character to that supplied the plaintiff. Proceeding, the witness stated that he called upon Mr. Lloyd at Wood Green, London, and had a conversation with him regarding the plaintiff's breakdown. He asked Mr. Lloyd what oil should be used in the firm's motors, and he replied, "Ordinary gas-engine oil, the same as we use for an Otto gas-engine," and at the same time he pointed to a gas-engine in the corner. The oil supplied to the plaintiff had also been supplied to Captain Hughes Morgan, who used it regularly, and to Mr. Anning, who frequently stayed in the neighbourhood, and it had given them every satisfaction.

The Registrar, in summing up, said it appeared to him to be quite clear that the plaintiff did not bring clearly before the defendants that his car was different in character to other people's cars, and, therefore, required a special kind of oil. Then they had in evidence that the oil supplied by defendants had given every satisfaction to other motor-car owners. Looking at the evidence very carefully, he failed to see that the plaintiff had brought his case within Section 1 of the Sale of Goods Act, and he therefore gave judgment for the defendants with costs.

SEQUEL TO A COLLISION.

At the Hereford County Court, Arthur Hines, engineer, of Hackney, sued Mrs. Helme, residing at King's Thorn, to recover £8 15s. for the repair of a motor-car. Mrs. Helme counterclaimed £15 10s. for damage done to her pony, carriage, and harness. Negligence on both sides was alleged. Mr. Hines, it appeared, was touring, in company with a friend, and whilst going down a decline at Harewood End Mrs. Helme and her son came round the corner of a cross road. A collision resulted. The trap and the car were smashed, the pony injured, and the occupants of both vehicles thrown out. The Judge failed to see that there was negligence on either side. The parties were entitled to costs on the claim and the counter-claim.

FURIOUS DRIVING CASES.

BEFORE the Basingstoke County Bench, Ernest Buffer of Lombard Street, E.C., has been fined 50s. and 13s. cost; Wm. Hutchings, of Woking, 38s. including cost; and Percy Black, of South Kensington, 43s. including costs—all for driving motor-cars at excessive speeds.

J. W. WICKENS has been fined 20s. and costs, at the West London Police Court, for furiously driving a motor-car in Finborough Road, Kensington.

At the West Hartlepool Police Court last week, C. E. Smith was summoned for furiously driving a motor-car. The police evidence was to the effect that he covered a distance of 320 yards in about thirty seconds, while a butcher estimated his speed at more than twenty miles an hour. The defendant gave evidence on his own behalf, saying he was a chief engineer and marine surveyor, and that sixteen miles an hour was the maximum speed of his car. On the occasion in question he had the machine geared to the second speed, eleven miles an hour. Mr. Arthur Levison, a marine engineer, and others gave corroborative evidence, and in the end the bench dismissed the case.

At Shoreham, A. F. Mortimer has been fined £4 3s. for driving a motor-car at a reckless pace.

H. H. RAPHAEL, J.P., of Havering-atte-Bower, Essex, has been fined £3 and 6s. costs for driving a motor-car at a greater speed than twelve miles an hour between Ingatestone and Brentwood on Easter Sunday.

At Brentwood, Edwin Jackson, of Kentish Town, was fined £2 and costs for furiously driving a motor-car at South Weald, on Easter Monday.

At Exeter, Leonard Willey, electrical engineer, Oxford Road, St. James, Exeter, was summoned for driving a motor tricycle furiously in

A NEW DANGER—ALCOHOL MOTOR-CAR HELD UP BY TOPERS.
(Fliegende Blätter.)

Fore Street, on April 12th, to the danger of the public. The magistrates said the public must be protected, and defendant would be fined 10s. and costs.

On Tuesday, Gilbert Errington, of Jermyn Street, W., was summoned at the Southwark Police Court, for furiously driving a motor-car across Parliament Square, on the 11th inst. As he admitted his error, he was only called upon to pay the cost of the summons, 2s.

CHARLES BELL, of Crosby Lodge, Carlisle, has been fined £5 and costs at Carlisle for driving a motor-car to the common danger.

NO LIGHTS.

STANLEY LAMBERT, of London, was charged at the Litchingdon (Essex) Petty Sessions with driving a motor-car without a light at Burnham. From the evidence of police-sergeant Digby it appeared that the offence took place at 3 a.m. Defendant explained that his lamps were burning when he reached Chelmsford, but he got out of his reckoning among the cross roads, and, in consequence of losing time, ran out of oil. Fined 19s. 6d., inclusive.

At the Folkestone Police Court, Sibley Simpson was summoned for driving a motor-car without a light. He pleaded guilty and was fined £1 and 0s. costs.

ROY SOHER, High Street, Loughborough, was summoned at Loughborough for driving a motor-car without a light on the 7th inst. P.C. Taylor gave evidence, and defendant said he had been to Belvoir Castle,

On the way back, at Melton, he examined his acetylene lamps to see if they would be all right when lighting up time came, and thought they would be. When he tried to light up, however, he could not do so, the lamp having gone wrong. Fined 10s., including costs.

A TRIPLE CHARGE.

At Leigh, Charles Whitley, of Manchester, has been summoned on three charges with furiously driving a motor-car through Leigh on the 15th ult. Superintendent Cocker said the summons was taken out under the town's Police Clauses Act, the Highways Act, and the Locomotives Amendment Act. Councillor R. Greenhough said that shortly before nine o'clock on Saturday night, the 15th ult., he saw a motor-car being driven furiously through Bradshawgate, Leigh. He could not see how many people were in it. It was travelling at about twenty-five miles an hour. When he followed he found it had run into Pennington's wall at Butts Bridge, which was knocked down. There were hundreds of people in Bradshawgate at the time. The motor-car was smashed and the party upset, though they escaped with a shaking. Defendant did not appear. On the first charge he was ordered to pay costs, on the second charge he was fined £10 and costs, and on the third charge he was ordered to pay costs.

ATTACKING A JEWELLER'S SHOP.

On Wednesday at Marlborough Street Police Court (London), Oswald Edward Lord, of Arundel Mansions, Fulham, was charged with being drunk and furiously driving a motor-car, and with causing bodily harm to a man. While driving down Regent Street early in the morning the car driven by defendant charged the window of a jeweller's shop, smashing the shutters, glass and frame completely to pieces. The damage, it was stated, amounted to some thousands of pounds. The car then ran back and knocked down a man who was passing, fracturing his arm, shoulder-blade, and several ribs. The case was adjourned until the afternoon for the defendant to be legally represented.

ALLEGED REFUSAL TO STOP.

At Cullompton Police court, John Bennett, a motor-car driver, of Wellington, was summoned by a farmer, for not stopping the car when requested to do so. The motor-car was the property of Messrs. Fox Brothers, of Wellington, and was used for conveying goods to their various factories. The evidence submitted being of a conflicting nature, the Bench dismissed the case.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, MAY 3, 1902.

[No. 165.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

THE EXHIBITION QUESTION.

ON Monday the Executive Committee of the Automobile Club of Great Britain and Ireland decided not to continue to negotiate with the motor-car trade in the matter of exhibitions, and to withdraw its name and patronage from the proposed exhibition at the Crystal Palace.

In our issue of March 15th, we announced that it was Mr. Charles Cordingley's intention to terminate the agreement with the Automobile Club. The next Motor-Car Exhibition will be held at the Agricultural Hall, London, from March 21st to March 28th, 1903.

COMMENTS.

The Club and the Trade.

THE history of the motor-car exhibitions and the part played by the Automobile Club is interesting. Going back to June, 1901, it will be remembered that the trade decided to support exhibitions at the Agricultural Hall in the spring of 1902 and 1903. In view of this arrangements were made by Mr. Cordingley with the proprietors of the Agricultural Hall and financial obligations duly entered into. Some of those present at the original meeting then supported a rival show, with the result that, by direction of the Automobile Club, they were prohibited from exhibiting at the recent display at the Agricultural Hall. The consequence was that applications for space had to be declined by the promoter.

The March Meeting.

THEN, in March of the present year, the Club invited promoters of exhibitions to suggest schemes for the 1903 Exhibition. Several made proposals, but Mr. Cordingley—in view of the decision of June, 1901—declined to enter into competition, and intimated his intention of terminating the agreement with the Club, according to the terms of notice provided for in that document. The trade held a meeting on March 20th at the Automobile Club, when several who had previously ignored the resolution of June, 1901, urged the appointment of a committee to consider holding an exhibition in January or February. This was agreed to, and Mr. C. Johnson accepted the position of secretary.

Patronage Given.

HAVING inspected a site at Earl's Court and reported adversely thereon, the Committee then circularised the trade with a view to getting firms to sign an agreement not to exhibit elsewhere than at the show to which the Club gave its patronage. Meanwhile the preparations for the Exhibition at the Agricultural Hall continued, and several leading firms secured good positions for March 21st to 28th, 1903. The Association which was appointed by the trade agreed to recognise the Crystal Palace exhibition of January 30th to February 7th, and the Club consented to give its name and patronage to that Exhibition.

And Withdrawn.

THE Automobile Mutual Protection Association joined in the discussion, and replied to the suggestion of the President of the Automobile Club as to its being unrepresentative in a letter which pointed out the inconsistency which had marked the reversal of the June, 1901, resolution; and their attitude has proved an important factor in the situation, for on Monday evening the Executive Committee of the Club decided "that they could not with dignity continue to negotiate with a trade divided against itself, and therefore resolved to withdraw their name and their patronage from the proposed exhibition at the Crystal Palace, and to refuse to give their name or patronage to any outside exhibition."

The Function of the Club.

HITHERTO we have refrained from criticising the action of the Club in the matter; but now that the matter has come to a conclusion, we may be excused a reference. Had the attempts to upset the unanimous resolution of the trade in 1901 not been allowed to continue, the trouble would not have arisen. Having entered into arrangements with the promoters of the Exhibition, the Club should have seen that the obligations into which the trade had entered were loyally carried out, and instead of opening the door to controversy its more dignified course would have been to have explained that the question was settled for 1902 and 1903—and that no negotiations could be entertained which were calculated to conflict with the policy that had been marked out by the trade in its earlier meetings. Let us hope that past experience will now cause it to steer clear of such matters in the future, and confine itself to its proper function, viz., that of popularising automobilism and providing a social centre for motorists.

Protecting the Trade.

IN connection with the purely trade interests of motoring, the Automobile Mutual Protection Association, Limited, is doing good work, and the accession of the Earl of Shrewsbury and Talbot to the presidency is a good augury for its future. Although in existence only a comparatively short time, it has—as will be seen from the report of the annual meeting in another column—proved of value to the industry, particularly with regard to patent questions, while in the matter of exhibitions, it has demonstrated its capacity to secure that freedom of action without which no industry can flourish.

Next Year's Show.

So far as the Motor-Car Exhibition at the Agricultural Hall in 1903 is concerned, everything points to a repetition of the recent success. Spaces are already being booked, not only by firms who exhibited, but also by some who were unfortunate enough not to secure space. These facts will probably lead to anxiety among intending exhibitors with regard to the stands, and we take this opportunity of suggesting to those members of the trade who have not yet secured the options of positions the advisability of giving the matter early consideration.

The Motor-Cycle Union of Ireland.

THE recently-formed Motor-Cycle Union of Ireland, held its inaugural run on Saturday last. The meet was in Phoenix Park, and fourteen motor-bicycles, a couple of tricycles, and a quad took part in a run to Bray. The inevitable photograph was taken at the start, and after indulging in a run round the park a start was made for Bray, *via* Dundrum and the Scalp. All those who started reached the destination safely, and were then joined by several other members, who had come by more direct routes. A moderate pace was maintained through the streets of the city, but on the unfrequented roads outside less regard was paid to the legal limit. After tea had been disposed of, an enjoyable smoking concert followed, and about 9 o'clock a start was made for town. The first run of the Union was an undoubted success.

Round the World.

THE motor-caravan, "Le Passe-Partout," which, with good luck, is to girdle the globe, with Dr. Lehweß, Mr. Max Cudell, and Mr. H. Morgan-Browne, started from Hyde Park Corner on Tuesday morning, amid the cheers of a large crowd. Accompanying the big vehicle was the 8-h.p. "Argyll," under the control of Mr. Douglas Whitfield. Several friends accompanied

its environment will generally in the end be accepted by the public as the most pleasing one. The days when printing presses and planing machines were adorned with fluted columns and Corinthian capitals is past, and where mechanical construction is involved simplicity is the best way to attain elegance; while, to adapt a proverb from the motor we are endeavouring to supersede, "a good car cannot have a bad outline."

Un Embarras de Choix.

THE choice of a new car is not always an easy matter to decide on even for the seasoned motorist, and it would be difficult, even if it were not invidious, to give good reasons for choosing a particular vehicle. It is much easier, however, to give some bad reasons for rejecting a car, taken from cases in which we have known them to be operative. The most absurd, yet an actual case, was an objection to the colour of the paint! The rather inferior finish of the same in another instance led to the choice of a worse, but better painted vehicle, while the fact of a third being obtainable with a particular maker's coachwork led to its selection in the place of a much better car. Yet again, a very suitable car was rejected by an intending purchaser because, being rather low-geared for the district, it "cut-out" too noticeably on easy grades, though a little gearing up would have rectified matters. Another was pronounced to

THE LANCHESTER CO'S. INVITATION RUN TO WORTHING ON APRIL 19TH. THE START FROM ST. JAMES'S PARK, W.
[Photo by] [Fradelle & Young.]

the expedition as far as Guildford. Tyre troubles caused a long delay about three miles this side the old town. At the Angel Hotel, at Guildford, about twenty sat down to lunch, when the voyagers were toasted. Later in the day a start was made for Southampton, where the vehicles were to be shipped by steamer to Havre. The route round the world is *via* Rouen, Paris, Brussels, Cologne, Warsaw, Moscow, Nijni, Omsk, Tomsk, Irkutsk, Peking, Tientsin, Japan, and across the United States. The most ample preparations for relays of petrol, accessories, and spare parts, particularly tyres, have been made along the line of route. On other pages of the present issue we reproduce photos of the big car as shown at the Exhibition last week, and one of "Le Passe-Partout" and the "Argyll" in Hyde Park on Tuesday last, just previous to the start.

The Line of Beauty.

MANY people will have had ample opportunity during Show week to form, or modify, their opinions regarding car design from an æsthetic point of view, and those who least realise the problems involved will probably assert their views with the most conviction. Grace of outline is a desirable, if minor point, about a motor-vehicle, though its contemplation affords small satisfaction during a "panne," but the design that has secured most popularity by the solid merit of adaptation to

have too little seating accommodation, too much of this being expected for the power and price. In this case the purchaser got what he wanted elsewhere, and was, of course, duly disappointed. Probably most of the minor mishaps—even down to explosions in the exhaust box—have been responsible for scaring off would-be buyers on trial runs, and it is well for the novice to form his choice—in the absence of an experienced and unprejudiced friend—on the old maxim, *Quod semper, quod ubique, quod ab omnibus*, and shun novelties, however they may appeal to his idea of what a car should be.

The Age of Indolence.

AS a counterblast to the high opinion of the value of motoring, from a hygienic point of view, expressed by so many of the medical profession, we are favoured by ominous vaticinations of its influence, more especially in the popular and widely-spreading form of motor-cycling, on the muscles of the race. One doctor is of the opinion that a cycle should never be made powerful enough to climb all hills, while another recommends a quarter-mile sprint every few miles (with Nature's organs of propulsion, *bien entendu*) if the benefits of motoring are not to be outweighed by its disadvantages. Some cars, however, require muscular effort where they should not—and we are not referring here either to hill-climbing or tyre-repairing.

A small car we recently tried had a clutch considerably stiffer than that of a 50-h.p. Napier, much to the inconvenience of the lady who owned it; while it is not uncommon to find hand-brakes that require quite needless muscular exertion to put on. It is not too much to say that all of the accessory mechanism of a car should be capable of being actuated without extreme effort, a state of things which presents no particular difficulties of attainment; and if its absence presents no great objection to the average driver, even he may find it inconvenient—perhaps dangerous—in an emergency where prompt action is needful.

The Manchester Automobile Club.

THE first run of the season of the Manchester Automobile Club will be to Tarporley to-day (Saturday). There will be no procession of cars, the members starting any time they may think fit. Tea will be provided at 5.30 p.m. at the Swan Hotel, Tarporley, which is situated in the centre of the village. This early hour has been fixed to enable those members who wish to make the return journey the same day and reach

late a few levers and everything is automatically carried out but the steering. The monotonous precision with which he reaches his journey's end, the complete absence of exciting or mysterious failures in the engine and running gear, the hum-drum perfection of the whole thing, in fact, makes him unhappy. All his vast, hard-won experience lies stagnant, he moans. It is called up only when he happens on some novice in a cheap car, and he often envies the man's ignorance and his luck in having a vehicle that jibs occasionally. Not that the old grumbler would give up his own car and go back. Oh, no! He cannot retrograde. He must only grumble.

Motor-Cars in Ireland.

IRELAND has hardly yet appreciated the value of the motor-car as an adjunct to the work of the agricultural revival that is now taking place there. But in connection with the creameries that are being organised throughout the country automobiles ought to play an important part in the collection

THE 8-H.P. ARGYLL AND "LE PASSE PARTOUT" AT HYDE PARK—READY TO START.

home in good time. It is suggested for those who desire, that the run may be continued to Chester for the week end, some members having already arranged to do so. Before tea, the grounds of Portal Hall, the residence of Mr. J. Marshall Brooks, will be open to the members and friends. After tea, a visit will be paid to Arderne Hall, the residence of Lord Haddington, permission to inspect which has been obtained.

Perfection's Dead Monotony.

THE human beast knows not complete satisfaction. His pleasures are based on comparative degrees of unhappiness. The lesser evil following the greater takes to itself the character of merit. When perfection is attained it introduces new evils, and one sighs for old conditions. There is fear of such happening in automobilism already, according to some croakers. The man who graduated on a mulish tricycle, and gained a wealth of patience and expertness on an elementary belt-driven voiturette, is not likely to feel very much happier when good fortune puts him at the helm of a modern car, that persists in being faultless. We have heard one grumbler compare his 16-h.p. Irreproachable to a stout trolley car. He complains that he has but to manipu-

late a few levers and everything is automatically carried out but the steering. The monotonous precision with which he reaches his journey's end, the complete absence of exciting or mysterious failures in the engine and running gear, the hum-drum perfection of the whole thing, in fact, makes him unhappy. All his vast, hard-won experience lies stagnant, he moans. It is called up only when he happens on some novice in a cheap car, and he often envies the man's ignorance and his luck in having a vehicle that jibs occasionally. Not that the old grumbler would give up his own car and go back. Oh, no! He cannot retrograde. He must only grumble.

Trams v. Motor-Cars.

AGAIN the bath-chair proprietors and other residents of Brighton are considerably alarmed at the revival of the suggestion that modern trams should be allowed to make themselves a nuisance on Brighton Front. This is a suggestion which crops up just before the season, every two or three years, at the southern watering-place, and we have a large amount of sympathy with the inhabitants, who regard it with disfavour—a disfavour, however, naturally associated with a somewhat mercenary motive. Whilst such a line might be a matter of public convenience, we certainly should object to the front

our seaside places being thus retained for the purposes of a metal roadway. But surely the people of Brighton are sufficiently familiar with motor-vehicles, and encourage a public service of motor-cars rather than a tramway. For, as we have often urged in these columns, a motor-car service has the advantage of being able to make use of side streets when necessary, and also to avoid great crowds, whereas the tramlines monopolise such a large portion of the roadway as to become a nuisance at any pleasure resort.

Motor Manufacturing Co., Limited.

THE balance-sheet and report which Mr. Roger Wallace, K.C., and his colleagues of the board of the Motor Manufacturing Company have sent to the shareholders of that concern is of general interest, and doubtless the summary we give on another page will be widely studied. Included in the assets, the largest total is that of £219,450 for licences, patents, patent rights, goodwill, etc. From April 30th, 1900, to May 31st, 1901, the gross profit on sales was £13,513, against which had to be set general expenses of the business, £18,387; directors' fees, £824; debenture interest, £183; and depreciation, £1,528; leaving a loss of £7,410. From May to October last the loss was £470; while from January 1st to March 31st orders to the value of £29,076 were obtained by the company, so that, with careful management, the company should yet be made a financial success. The scheme of reconstruction proposed to the meeting on Thursday involved the reduction of the capital of £300,000 to £80,000. Every holder of a £1 share will receive one 5s. share credited with 3s. paid, and thus reduced in capital the shareholders will expect a dividend ere long. The company has wisely decided to limit its operations to four standard types of vehicles, and now that the time of experiment has ceased, it is to be hoped that the works will be kept busy with the production of voiturettes, and 7, 10, and 12 h.p. motor-cars.

Tyres.

IN our correspondence columns this week a well-known doctor suggests an inquiry into the circumstances attending punctures which should lead to a series of letters from those who are familiar with such circumstances—and certainly no motorist can claim to know nothing of punctures, whether along the public highway or in more secluded positions. It is suggested that if readers would favour us with information on certain points it might result in some general conclusions which would be of assistance not only to makers of tyres, and to the scores of people who are now experimenting in that direction, but also to manufacturers of automobiles. There is no doubt that motorists do not always obtain exactly the size and make of tyre suitable to their particular cars, and what may be safely used on one kind of vehicle might lead to the "inevitable puncture" on another. Certainly the point is one upon which there should be a good supply of experiences.

In Evidence.

IN a recent issue we illustrated Signor Marconi's adaptation of wireless telegraphy to the automobile, and the pity is that the idea is at present, like so many other good things, only in the air. Otherwise it might have played a prominent part in a case which was heard in the King's Bench Division the other day. A Canterbury watchmaker brought an action to recover damages for assault from a local ironfounder, and in the course of evidence it appeared that the fact that the defendant's motor-car had broken down, causing him to arrive home late, was the source of all the trouble. Other witnesses said that some of the stories told in the court were "purely imaginary." We should hope that the wickedness of this particular motor-car was equally of a visionary character. But the motor-car as a subject of evidence in cases of a certain kind was bound to occur.

Furious Driving

THE question of the furious driving of motor-cars has again cropped up before the executive council of the County Councils Association, it having been introduced by a letter from the Automobile Club, which we are sorry to see is described in the current week's *World* as "nothing if not more or less exclusive." The Club asked the Association to reconsider the resolutions which it recently adopted, recommending enhanced penalties for furious driving. After some discussion a reply was couched, in which the Association re-affirmed their previous decision, and, in fact, declared that they did not see any reason for reconsidering it. We are afraid that the many prosecutions which have lately been recorded will do something to strengthen the hands of the County Councils Association. Hence it is imperative upon motorists throughout the country not only to be careful as to the speed at which they drive along frequented roads, but also to expose the un-English methods by which the police evidence is frequently obtained.

Scavenging Up-to-date.

THE Wellingborough Urban Council, having made application for a loan of £650 for the purchase of a motor-van for the purpose of the collection of refuse, etc., Mr. H. P. Boulnois, M.I.C.E., one of the Inspectors of the Local Government Board, has attended to hold an enquiry at the Council Chamber. The clerk (Mr. J. T. Parker) explained to the inspector the present plan of collecting the refuse by means of carts, and pointed out the objections to the system, which cost the Council £280 a year. Under the proposed new system the refuse would be collected from the backways of the houses, and besides being a more convenient and cleanly way of collecting the refuse it would be a saving to the Council, as the motor-van would be used for other purposes for which at present other means of conveyance had to be used. Evidence was given in favour of the scheme by Mr. J. H. de Key (engineer), Mr. Geo. Henson (late chairman of the Council), and Mr. Wm. Hacksley. The inquiry then closed. It is to be hoped that the Local Government Board will grant the application.

New Motor-Car Services.

LONDONERS and visitors to the great City are promised new pleasures for the coming summer, and motor-car services are to be established from the metropolis to Windsor, Brighton, Hampton Court, and other places likely to attract holiday-makers. The London termini will be at Westminster (near the Houses of Parliament) and in Piccadilly, and there will be daily trips to Windsor and Hampton Court, with subsidiary runs to Bushey and Richmond. The fare to Windsor will probably be about ten shillings, and to Hampton Court about four shillings less. The motor-vehicles will, it is hoped, run until October.

Warnings.

IT is not only in Surrey that motorists should be careful, and policemen are not the only foes of our order. This week's "Correspondence" columns contain two letters exposing two forms of persecution to which automobilists are liable. In the neighbourhood of the historic Rye House, in Hertfordshire, there is, it appears, a toll of 1s. 6d. demanded from motorists, while that for horse-drawn vehicles is only 3d. Doubtless other instances of a similar kind are known to readers, and we shall be glad to receive information on the point, so that a warning note can be given and other routes taken in time. The other complaint we have received relates to the action of the police on the Leeds road between Stanningley and Bradford, from which we learn that the police of that part of Yorkshire are as intolerant as they are in some parts of Kent and the home counties.

MECHANICAL FLIGHT UP-TO-DATE.*

By SIDNEY H. HOLLANDS.

CHAPTER VII.—SUPERPOSED SUSTAINING SURFACES.

IT is probable that systems of superposed surfaces for sustentation in aerial machine design have an important future.

By superposed surfaces is meant a "double-decker," or even a "multi-decker" arrangement of such surfaces in *parallel tiers or layers*, at a certain fixed minimum distance apart, to admit of an adequate thickness or depth of air stratum between them.

FIG. 1.—SECTION OF PHILLIPS' AEROCURVE.
C = Centre of Pressure at $\frac{1}{3}$ of breadth from leading edge.

The experiments of Wenham, as long ago as 1857, and those in more recent years of Brearey, Hargrave, and Phillips respectively have shown encouraging results.

In the experiments of Henson and of Brearey the surfaces were "double-decked" aeroplanes; but in those of Phillips it was a multi-tier aerocurve arrangement. In the latter system, which was a new departure in its way, the aerocurves were

FIGS. 2 AND 3.—LARGE "HARGRAVE" CELLULAR KITE.—THREE-DECKER TYPE OF SOARING MACHINE.

narrow in relation to their length (transversely), being shaped out of light wood, slightly concave on the under, or sustaining, sides, and convex above, but of more convexity (see Fig. 1). With this particular form of aerocurve the most efficient angle of inclination was found to be 15 deg. It will be noticed that this concavo-convex section bears some resemblance to the section

*All rights reserved.

of a natural wing, and it may be here remarked that aerocurves in general are found to be far more efficient than aeroplanes; in fact, the latter "have had their day," and may now be regarded as displaced by the former surfaces. Here, again, is an approximation to the formation of Nature, with advantage ensuing, apparently, as a consequence. No natural wing is a *flat* surface,

FIG. 4.—HALF END-ELEVATION.

To Sir George Cayley, one of the pioneers and early writers on aviation, living early in the century, is seemingly due the credit of first discovering that in narrow inclined planes, or slats, the centre of pressure or resistance does *not* coincide with the centre of surface, but is ahead of it in proportion to the acuteness of the angles. The same law has since been found to apply to aerocurves; and in that illustrated in Fig. 1, at an angle of 15 deg., the centre of pressure was at *one-third* of the breadth from the leading edge.

With Mr. Hargrave the superposed surfaces took the form of his original ingeniously conceived "cellular kites" (see Figs.

FIG. 5.—STEPPED CONDITIONS OF SAILING BIRD'S WING FEATHERS.
(Cross Section.)

2, 3, and 4), of which he made and tried numerous varieties successfully, and with very interesting results. Some of these "kites" have been of such size and lifting capacity that Mr. Hargrave has hitched four or five of them to one line (in series), and been thereby lifted to some height above the ground (see Fig. 6). I am strongly impressed that there is a sound practical reason for the subdivision of the natural wing into its component feathers,

This reason I take to be quite apart from that of the obvious convenience for closing and folding them compactly and close to the bird's body when not in use, and wholly unconnected with the hypothetical and now exploded "valvular" action theory of wings (the former condition being merely incidental), and that is, that the separate feathers form and act as two lateral

sets of superposed aerocurves, or wings (the natural feather being really a wing in miniature), and thereby greatly augment the effective sustaining surface, *i.e.*, giving much greater effect particularly in sailing—flight—than that merely due to the breadth of wing, as seen in plan. This interesting and suggestive function of the feathers and condition of the natural wing has been noticed

FIG. 7.—HOLLANDS' SEMI-SUPERPOSED OR "STEPPED" SYSTEM OF MULTI-AEROCURVE SUSTAINING SURFACES.
(Not restricted to three tiers.)

by a careful observer (through the medium of a good field glass). In thus watching some of the large sailing birds during their various evolutions it was seen that their wings when viewed side on (and on as regards the wing itself) were not only inclined as a whole at a small positive angle with the horizon, but that the individual feathers were distinctly separated and so inclined, evidently at the same angle as the wing (see Fig. 5). This certainly seems to be a clear analogy in Nature to systems of super-

posed surfaces now advocated. The recital of this observation first suggested to me, now twenty years ago, the probable great advantage derivable from an analogous arrangement of aerocurves—four inclined and stepped series in two pairs at diedral angles, and separated longitudinally (see Fig. 7). This "stepped" or semi-superposed multi-aerocurve system is exceedingly efficient, as was anticipated.

It is tolerably certain that the ordinary, or "two-decker," arrangement of superposed surfaces was evolved quite independently of suggestion from the birds. No one, as far as we have any record, has previously to 1881 noticed this condition of the natural wing, and Wenham suggested the use of double-decked aeroplanes as long ago as 1866.

(To be continued.)

GLASGOW TO LONDON.

REGENT issues have recorded the successful motor-car run from Glasgow to London, and we now have pleasure in chronicling the official figures which have been given us by Mr. Robert J. Smith, the hon. secretary of the Western Section of the Scottish Automobile Club, which is to be congratulated on the work it has done in popularising automobilism north of the Tweed. The maximum number of marks possible was 1,000, the marks obtained being:—De Dion phaeton, 986; M.M.C. car, 974; 16-h.p. Napier, 968.

Thus it will be seen that, while the places were rightly assigned last week, the marks now recorded show a greater uniformity of performance than did the preliminary figures. Each mark deducted represented a stop of one minute, and in the case of the De Dion phaeton 14 marks were deducted for stops for mechanical and other causes; as regards the Motor Manufacturing Company's car 12 marks were deducted for tyre troubles and 14 for mechanical and other causes; and in the case of Mr. Edge's Napier the 32 marks deducted were all for tyre troubles.

In a previous report we mentioned that when the other cars arrived at York nothing had been heard of the 8-h.p. and the 4½-h.p. Eagle motor-tandems. We now learn that, owing to being wrongly directed just before reaching Durham, the driver of the 8-h.p. Eagle tandem, in the dark and mist, mistook the road, and drove, when on high speed, into a ditch. The consequence of this was that the low-speed clutch became jammed, and, although the driver persevered, he was compelled, after going a further three miles, to give up on account of the clutch pinion stripping. Up to that time the tandem had behaved satisfactorily, and was only a very few minutes over the minimum time, taking into consideration that on several occasions the driver took the wrong road—at one time being over twenty miles off his proper route.

The Hozier Engineering Company inform us that the reason of the failure of the "Argyll" car in the non-stop run from Glasgow to London was that the crank pin on the half-time shaft of the Simms motor, which actuates the magneto machine, unscrewed from the disc, coming in contact with the fly-wheel, with the result that the end of the half-time shaft was bent and the pin itself completely destroyed.

THE members of the Yorkshire Automobile Club held a short run on Saturday last to Boston Spa.

MR. D. M. A. FIELD, carriage builder, Chichester Road, Bognor, has now added suitable accommodation in new premises, adjoining his carriage factory, for twenty motor-cars. Arrangements have also been made for the cleaning and overhaul of cars. A stock of Pratt's motor spirit, Carless Capel's petrol, and lubricants is kept on hand.

THE Motor-Car Exhibition at the Agricultural Hall.

SECOND NOTICE.

Photo by]

H.R.H. THE PRINCE OF WALES AT THE EXHIBITION.

[Argent Archer.

OUR task of recording the special features of the great Motor-car Exhibition does not conclude with this week's reports on the stands. In our last issue the work was begun, and again we have to supplement our ordinary pages in order that justice may be done to what is regarded by everyone in the trade as the first really representative and International exhibition held in this country. We would ask the firms whose exhibits have not yet been described to recognise the completeness with which the Show is being reviewed in these columns, and to rest assured that no stand has escaped notice. But it is absolutely impossible to chronicle our impressions in two issues; and hence it is probable that the next two issues will, like their predecessors, be largely devoted to describing the new and interesting developments in automobilism which were brought to public notice at the Exhibition which came to a successful close on Saturday last.

Of particular interest to owners of steam cars was the exhibit of the Albany Manufacturing Company, Limited, whose specialities include condensers, feed heaters, sight feed lubricators, combined feed and hand pumps, water sentinels, etc. The pump is intended to control the supply of water to flash boilers, such as are used on the Serpollet cars, and its main feature is a spring-controlled diaphragm. As the pressure on the back of this develops the fulcrum of the lever in the suction chamber shifts its position, and causes the foot valve to be held up for a more or less proportion of the stroke. The result is that as the pressure increases the fulcrum travels nearer the valve, until the maximum pressure at which the spring is set for is arrived at, when the pump passes no water whatever. When a fall in pressure, no matter how slight, takes place, the pump will re-commence to work, delivering even to one-hundredth part of its stroke. A water sentinel, which automatically shuts off the petrol supply when the boiler runs short of water, thus relieving drivers of all anxiety with regard to the likelihood of scorched boilers, was next inspected. The Albany Company also made a feature of their condensers and coolers, both in the vertical and in the horizontal form. When employed in the latter way it is placed below the car at a slight

angle in the direction of travel, thus catching the wind, which becomes circulated over the whole of the tubes, the metallic corrugated radiators between the tubes baffling the air over the surface of the tubes, simultaneously throwing off the heat generated. These condensers are formed from flattened tubes connected with long ones, the cooling effect being increased by the thin metal connections between each cross tube.

The National Gas Engine Company, Limited, of Ashton-under-Lyne, had a well arranged stand, whereon they exhibited their National (improved Otto) gas engines. These are fitted with patent air filters, and continuous lubrication at both ends of connecting rods. There is also a patent piston pin adjustment, by which the wearing surface is much increased and the tendency to wear correspondingly diminished. The adjustment is of a very firm and rigid character. The side shaft is of a strength sufficient to ensure steady running, which is further facilitated by the character of the wheels employed in transmitting the motion to the governor spindle. These wheels are of the skew gear type, preventing irregularities due to wear and admitting of a very strong construction. As the governor works in a vertical position the great advantages of the dead-weight with the spring are secured, and any alteration in the speed of the engine that may be required can be made without stopping it. The exhaust valve, seating, and spindle guide are part of the main casting, thus ensuring durability and preventing damage from over-heating, as well as the fear of broken joints.

Motor accessories constituted the display made by Joseph Lucas, Limited, of Birmingham—a firm that evidently endeavours to supply everything within the range of the ordinary requirements of the motorists. These include motor lamps of good design for burning petroleum or acetylene, notably the "Lucas Headlight" and the "Petrophoto" lamp; motor horns fitted with flexible extensions, lubricators, lifting jacks, sparking plugs, valves, motor pumps, repair outfits, lubricating oils and greases, etc.

Messrs. Turgan, Foy, and Co., who are meeting with considerable success with their heavy steam vehicles in France, displayed a lorry capable of carrying a load of three tons and hauling a further three tons on a trailer. The frame, which is of strong construction, is carried by springs upon the front and rear axles. The vertical boiler, which is placed in front, is of the water-tube type, but quite different from the usual pattern, there being no water-pockets at the bottom. The steam drum has a number of water-tubes projecting downwards and outwards. The working steam pressure is 210 lbs. per sq. in. Coal is used as fuel, and is carried in bunkers at the front. The water-tank has a capacity of 800 litres of water, which will run the vehicle for a distance of about 20 miles. A couple of feed-pumps are provided, as also an injector. Each of the rear wheels is driven by means of a chain from a separate compound horizontal reversing steam-engine, access to which is afforded by doors on the sides of the vehicle. The normal engine speed is 600 revolutions per minute, the

the knees of the passengers, it should be possible to *maintain* a warmth far more effectually than by any system of *foot-warmers* and the like, while in the case of electromobiles the *interior* of the cars will be easily and effectually heated. Mr. Dowsing claims to have overcome the difficulty of obtaining a continuous current, irrespective of speed, and in fitting the dynamo to the axle of petrol cars shows an ingenuity to which we hope again to refer in a later issue. In the case of electrical vehicles, current will, of course, be supplied from the accumulators of the cars.

Le Carbone had an interesting display of electric accessories for use in connection with motor-carriages. Chief among them may be mentioned the "Sanspareil" dry battery for use with the ignition apparatus of petroleum-spirit motors. It is claimed for these cells that they give the maximum output for the minimum weight and dimensions. The cells offered for tricycles, with suitable coils, will last between 300 and 500 working hours. Le Carbone Company also makes a speciality of carbon brushes.

FIG. 38.—A TURGAN-FOY STEAM VEHICLE HAULING FOUR MILITARY WAGONS IN THE RECENT FRENCH HEAVY VEHICLE TRIALS.
(*La France Automobile*.)

engines developing 20 h.p. each. By this arrangement no mechanical change-speed gear nor differential are necessary, while, should one of the engines break down, the other is sufficient to propel the car home. The complete vehicle weighs about 4 tons. The maximum speed obtained from trials has been fourteen miles per hour. Hand and pedal brakes are fitted; steering is controlled by a horizontal hand-wheel, while the road wheels are of strong artillery type, with wide steel tyres. Fig. 38 shows a Turgan steam wagon hauling four military wagons in the recent heavy vehicle competition in France.

The first stand on entering the Hall was that of the Dowsing Radiant Heat Company, Ltd., where the well-known Dowsing Luminous Electric Radiator was on view. By this system the radiant heat, popularly known as "warm sunshine," is obtained, and we learn that the system is now being applied to the warming of automobiles. Mr. Dowsing, the inventor, is himself a motorist, and has, therefore, felt the cold associated with open-air travelling in the winter. By fitting one of these radiators in a corner of the car near the splashboard, and throwing a rug carefully over

The concern is now making dry batteries for use on large cars, done up in neat oak boxes. Paris cells and funnels were also shown. In these, the excitant is of ordinary sal ammoniac solution, and the components can be readily disconnected and renewals effected when necessary. The funnel is of a construction that enables the cells to be filled or emptied without any of the connections being disturbed.

Two novelties were shown by Mr. E. H. Seddon, one being a steering wheel fitted with an inflated rim, much like a pneumatic tyre, and giving a hard resistance, that the inventor regards as preferable to that of the ordinary wood or metal. In the "Coronation" tyres Mr. Seddon has adopted the principle of a triple air-tube, with a valve to each separate air chamber. Thus, should one be punctured, there is another ready to be blown up. The tyre has a deep and narrow tread, and metal plates are let into the rubber to protect the cover. The tyre is made for wheels of all sizes, and is easily detachable. Mr. Seddon claims that his tyre has effectually disposed of the fear of sideslip, and its adoption by motor-car makers will be watched with interest.

The exhibit of the Duryea Company consisted of two cars—a 10 h.p. Duryea phaeton (Fig. 39), seating two persons, and a 10-h.p. Duryea *tonneau*, seating six. In both cars the main features are the same. The two-seated phaeton has neat light folding top or hood, with storm apron, and weighs complete 800 lbs. The engine, which is the same in both cars, is of 10 h.p., having three cylinders $4\frac{1}{2}$ in. diameter by $4\frac{1}{2}$ in. stroke. The cranks are set at an angle of 120 deg. to each other, a supporting bearing being fitted between each. Lubrication is simple and effective. A

FIG. 39.—THE DURYEA PHAETON.

plain "pot" lubricator on each cylinder requires filling about once in 500 miles, and splash lubrication in the crank-chamber does the rest. The water circulation is on the thermo-syphon system. A float feed carburettor supplies fuel to a single induction-pipe. Ignition is by a Remy magnet, with battery in reserve, worked off the fly-wheel, and the sparking hammers are carried through the hollow stems of the exhaust-valves. The speed of the engine, which is normally 800 revolutions per minute, is controlled entirely by varying the opening of the induction-valves. This is effected on all three cylinders equally and simultaneously by turning the handle-grip, which is held by the steering hand. The extent to which this can be done is so great that change-speed gearing is virtually abolished, for although an epicyclic gear is available for use in emergencies, this gear in ordinary use revolves locked together, and transmits the power direct from the crank-shaft to the driving-wheels by a single chain. The crank-shaft carries a Crypto or epicycloidal gear, giving a four to one speed reduction and also a reverse. The efficiency of the system is claimed to be such that, with a nine-tooth sprocket, one of these cars will ascend a one in ten gradient at a speed closely approximating twenty-five miles an hour. In ordinary running the engine is used as a brake, being simply throttled down to retard the speed to the desired degree, whilst the wheels may be skidded

FIG. 40.—THE DURYEA SURREY.

by using the low gear. Two brakes are also fitted—one an expansion brake, acting within the drum of the balance-gear on the axle, which can be applied independently of or in conjunction with the engine, and acts with equal power in both directions; the other is an emergency brake acting on the tyres. This is provided with a ratchet, so that the car may be held on a hill with the engine free. The driving-chain is provided with felt pads, which keep the pins constantly lubricated. It is protected from dust and mud by

a light leather gear-case. Another special feature in these cars is to be found in the one-hand control. The steering is effected by a single central vertical lever, a slight pressure of which to either side deflects the steering, and directs the course of the motor-car, the steering being rendered irreversible by so setting the angles of the steering centres that no leverage against the driver is introduced when striking obstacles. The same hand which does the steering controls the speed of the car, as already described, whilst by depressing the handle upon its stem the clutch is thrown out, and a catch holds the motor out of gear. The release of this catch by finger pressure, and a further depression of the handle, tightens a band around the gear, and brings the low gear into play. A small lever pressed by the heel effects the reverse. Large road-wheels are used (36 in. and 30 in. diameter) they being shod with 3 in. tyres. The motor and driving mechanism are under the forward seat, and are readily accessible by lifting the seat or removing the foot-boards in front, so that the passengers in the rear need not be disturbed for any purpose; only the water-tank being under the rear seat. The carriage is long and low, and is fitted with long and exceedingly easy springs. The six-seated *tonneau* has the same distinctive constructional features as the phaeton, but shows the "two-handed control," which is offered as an alternative if desired. In this, one hand steers and works the throttle, whilst the other actuates the clutches.

We generally expect to find something interesting at the exhibit of Mr. Carl Oppermann, and his stand was no exception to the rule. First, we noticed an electrical victoria, finished and upholstered in a luxurious manner. It is adapted for a run of from sixty to seventy miles on one charge of the battery. Another little car on Mr. Oppermann's stand was a two-seated "Electric

FIG. 41.—THE OPPERMANN ELECTRIC MAIL VAN.

Runabout," built to carry two persons and to run a distance of twenty-five to thirty miles with one charge of the accumulators. It is very easily managed, is absolutely silent in running, and the speed can be set to four, seven, or ten miles an hour. The wheels and axles, together with the motor and gearing, brakes, etc., are carried on a steel tubular frame, quite independent of the carriage body. The battery consists of thirty cells of the A.B.C. type. The motor is 1-h.p., and drives the hind wheels direct by means of a worm gear, which is entirely enclosed. The carriage is sent out complete with electric lamps, volt and ampere meter, mileage recorder, hand and shoe brakes, and safety catch to prevent the car running down hill backwards, etc. The weight of the car complete is 8 cwt. The novelty at the stand was the electric mail-van built for the G.P.O. through Messrs. Julius Harvey and Co. This van (Fig. 41), which has a body of the Post Office type, painted red all over, is provided with a single motor of 3 h.p.,

the transmission being by single reduction spur-gearing on to the differential on the countershaft, and from the latter to the rear axle by two chains. The motor itself is mounted on cross stays. The battery consists of forty cells of 160 ampere hours' capacity, sufficient to run the vehicle a distance of about seventy miles on one charge. The van, which is intended for the collection of letters from street boxes and conveying the same to the sorting office, will carry a load of from 5 to 10 cwt. The controller is adapted to give three speeds ahead, the maximum being twelve miles per hour. A tiller controls the steering, while a pedal actuates band brakes on the hubs of each of the rear road wheels. In all the vehicles the new A.B.C. accumulator is employed. In this the plates are firmly bolted together, and rest on small feet in the bottom of the cell. The plates are of the pasted type. The cells each contain eleven plates, and weigh complete 22 lbs. They have a discharge rate of 22 amperes for nine hours. As an example of the economy of space effected, we may mention that only half the driver's seat on the Post Office van is employed as a receptacle for the batteries used to run it. Mr. Oppermann informs us that a run of 100 miles with one charge has been made

No constantly burning pilot light is used, but a steam blast can be turned on whenever there is a heavy wind about, or when the car is standing with the fire cut down. It is claimed that the car can be left for an hour and a half with the burner only just alight with the water gauge showing three-quarters full, and that there will still be a quarter glass at the end of the time, the blast passing off any steam which is generated. The starting is effected by burning methylated spirits under a small coil. After the coil is heated a small supply of petrol is admitted through it to the burner nozzle, and sufficient heat is quickly generated to start the main vaporiser, which consists of tubing, passing three times through the boiler, and once across the fire. A very neat condenser is placed behind the front axle, and under the floor board. It consists of small straight tubes opening into pockets at each end. The steam is passed through it three times, and any not condensed is turned into the exhaust superheating tubes, of which there are ten in the smoke box, and there burnt. The touring car can be fitted with wood or wire wheels, and with either solid or pneumatic tyres. It has a wheelbase of 72 in., and completely detachable *dos-a-dos* back seat. The boiler is 16½ in. diameter and

FIG. 42.—THE READING STEAM TOURING CAR.

with an A.B.C. battery weighing only 9 cwt., in one of the Oppermann carriages.

The (Reading) Steam Vehicle Company of America exhibited through Mr. John L. Sardy three steam cars on the Reading system—a two-seated Stanhope, a four-seated Surrey, and a new touring car (Fig. 42). The principal features were described at length in our report of the 1901 Show about a year ago. It will be remembered that a main point of difference between the Reading and other light American steam cars is the four-cylinder, single-acting engine with single central rotary valve, which effects the steam distribution for the four cylinders. An improvement has recently been made in the engine in the form of a simplified reversing gear. Instead of the bell crank reverse on the top spur wheel driving the valve, the vertical valve shaft is cut at about mid-length, and the drive transmitted by three bevel wheels, the central one being fitted on a quadrant, so that when the reverse handle is moved, the pinion is displaced and the top half of the valve rotated to start backwards. In the Surrey and the new touring car the engine is completely encased, and, instead of roller bearings, plain phosphor bronze bearings are now employed. Steam air and water pumps are fitted; they are of a simple kind, there being only two working parts in each pump.

14½ in. high. The car is constructed to carry twelve gallons of petrol and thirty-four gallons of water. The car is further fitted with steam water tank filler, locking brake, and auxiliary hand pump. Altogether, the new Reading cars show every evidence of careful attention to details.

The Longuemare carburettor for automobiles, previously described in our columns, was in charge of Madame Lockert, who also showed a collection of needle valves and conical joints by the same maker. In the type of carburettor specially designed for use on motor-bicycles, the spraying arrangement is always in the centre of the chamber, the sprayer being formed by a cone with saw-cuts. The joint valve is not employed, as the float keeps the liquid ready to stream from the jet when the vacuum is created, but otherwise does not permit it to flow out. A cylindrical piece directs the air to be carburated entering from the bottom towards the sprayer. It also serves as an atomising surface, so that the incoming air passes a mist of petrol spirit, being thus carburated before entering the cylinder.

A good selection of accumulators, coils, sparking plugs, and electrical accessories of every kind was shown by the General Electric Battery Manufacturing Company, who made a feature of the charging board for charging accumulators for electric light

mains, which was described and illustrated in the *Journal* on the 15th ult. By means of this device small batteries can be recharged in about six hours, and for accumulators up to seven ampere hours' capacity on a 100 volt circuit one 16 c.p. incandescent lamp is sufficient. Inspecting lanterns and test lamps, pocket volt and ampere-metres were also shown.

Unfortunately the Gainsborough Motor Engineering Company, Limited, were unable to show a finished specimen of their car as they intend to place it on the market, fitted as a *tonneau*

FIG. 43.—THE GAINSBOROUGH DUCHESS CAR.

and easily convertible into a brougham. By means of a model, however, the principle of their new invention was made clear. The sides, front, and top of the brougham body can be easily folded and dropped into a space about six inches wide, extending the whole depth of the vehicle. As this will externally appear as part of the panel, it will be undistinguishable from any other similar body. When fixed in position it will be kept rigid by safety clutches, while the joints are not only water-tight but dust proof. On this stand was the Gainsborough car, fitted with a horizontally-placed 16-h.p. engine with two cylinders, closed at both ends, and each containing one piston. Connecting rods outside the cylinder, and fixed to a shaft which passes transversely through the cylinder and piston, convey the power to the crank shaft. At the point where the shaft goes through the cylinder the latter is slotted, the slots being equal in length to that of the stroke. An aluminium crank shaft is fitted with an inspection plate. The power is transmitted by a Renold chain enclosed in a case. Three speeds and a reverse are provided as well as the familiar wheel steering, a float-feed type of carburettor and automatic lubrication. There are three double-acting brakes, the emergency brake being fixed to the countershaft, and a foot pedal actuating the band brakes fitted to the hubs of the hind wheels. Consequently no brake power is transmitted through the gear unless the emergency brake is brought into action. The car is mounted on long laminated springs with the bearing surface at each end bushed with gun-metal. It has a wheel-base of 7 ft. 6 in., and the pneumatic tyres are 870 by 90.

Specially designed to meet the requirements of motor-cars, the "Umpire" ignition storage batteries were shown by Messrs. Sutherland and Marcuson. These are fitted with elements of the Umpire type, held together by means of acid-resisting elastic bands, thus keeping the active material constantly under pressure and preventing it from falling away or losing contact with the grid. The "Umpire" storage batteries for carriage lighting were also exhibited by the firm. Owing to the compactness of this battery it can be placed inside the driver's box or under the seat, thus rendering it well adapted for lighting vehicles. The accumulator is of a solid character, and there being no liquid space the "washing" of the electrolyte is prevented. Hence the risk of removal of the active material from the plates is obviated. A 4-cell battery with a capacity of 30 amperes is the size recommended, this being sufficient for lighting three lamps for a reasonable time. In connection with this the "Umpire" charging board is employed. This instrument enables any form of battery to be charged from direct-current electric mains at any desired rate of charge. It also acts as a resistance, and in addition to indicating

the direction in which the current is flowing it gives an approximate indication of the amount of current passing.

Motor lamps and accessories formed the main objects of the display of Messrs. Salsbury and Sons, Ltd., special prominence being given to the Salsbury Flario acetylene lamp, which is well adapted for automobiles. The Flario tail lamp, which is securely attached to the tail of the car by a strong screw grip socket at the back, is another excellent production. This can be used as an inspection lamp by simply removing the ruby slide. A Flario side lamp, to burn paraffin, is made for big cars in two sizes larger than the Salsbury Dietz lamp, and that for very small cars in two sizes smaller. The Salsbury Search Light, the Salsbury Dietz Auto light, and the Salsbury automobile lamp, the latter to burn paraffin, were also shown. The Essaness voiturette lamp, introduced at the last Exhibition, was also on view, a special feature being that the back and front can be easily opened to gain access for cleaning. Mention may also be made of the firm's system of acetylene gas lighting for omnibuses and public vehicles. In this two lamps are employed, each giving a 30 candle-power light, and so arranged that the light is diffused equally in every part of the vehicle. This is a feature which should be seen by all interested in public service vehicles. Included among the accessories on Messrs. Salsbury and Sons' stand was the Salsbury motor spirit transfer Spout, by which motor-spirit can be poured from a motor-spirit can to the petrol tank of a motor, without any possibility of spilling. It is fitted with an air escape, and has the advantage of obtaining access to the motor where a funnel or can are impossible. Motor oil and lamp brackets for motor-cars completed a display which attracted considerable attention in the Arcade.

Messrs. G. W. Sheldon and Co., who undertake the packing and shipping of motor-cars, motor-cycles, etc., to all parts of the world, were present with full particulars of their facilities for dealing with such goods. The trade in motor-cars between various countries is not only a large but is also a growing one, a fact which encouraged the firm to have a stand at the Exhibition, thus bringing themselves before all who are likely to be interested in the matter.

The 1902 models of the Argyll cars, made by the Hozier Engineering Company, Limited, have been so recently described in the *Journal* (see issue February 15th last) that it is unnecessary for us to deal with them at length on the present occasion. Suffice it therefore to mention that four cars were shown—three *tonneaux* (Fig. 44) and a double phaeton—all fitted with 8 h.p. Simms motor magneto-electric ignition, with natural water circulation by means of the now well-known double motor bonnet tank, which

FIG. 44.—THE ARGYLL 8-H.P. TONNEAU.

forms a feature of the Argyll system. The power of the engine is transmitted through a friction cone clutch and change speed gear, giving three speeds forward and one reverse, and thence by double universally-jointed shaft to the live rear axle. The transmission gear has already been fully described, and it may be remembered that on the top speed the driving and the driven shaft, which are in line with one another, are clutched directly together, none of the gears being used to convey power. These cars appear to be well built, and have a very taking appearance.

Although this is the first time the Societe des Automobiles Delahaye have participated directly at any exhibition in England, the name of the firm, or at least of their cars, is very well known in motoring circles in this country. Altogether seven or eight cars were exhibited by this firm, ranging from 8 to 12 h.p. In our

with the transmission mechanism. For the first and second speeds, the belt is moved over on to the inner pulley (3); the latter is carried on a sleeve on which is mounted a spur-wheel, gearing with a pinion on a short forward countershaft. On the latter are also carried a couple of pinions, either of which may be

FIG. 45.—ELEVATION OF DELAHAYE LIGHT CAR.

issue of April 5th last we published a detailed description of the Delahaye 6 to 8-h.p. car, so that on the present occasion only a brief reference to the *tonneau* shown is necessary. Hitherto the motor in the Delahaye cars has always been located in the rear of the frame, but in the 1902 models a forward position for the engine has been adopted (see Fig. 45). The frame is of tubular construction, rendered rigid by a series of connecting stays. As regards the engine, the horizontal type has been retained, this having in the 8-h.p. car a single cylinder. The water circulation is maintained by a gear-driven pump and radiators. The ignition is, of course, electrical, and a novel feature is that combined with the spark-retarding device is an arrangement for opening the compression cock. Fig. 46 gives a section through the explosion end of the engine, from which it will be seen that the valves can be readily detached. The diagram also shows the water jackets to the valve-chambers, and the method of operating the exhaust valve. The cylinder is lubricated by means of the valve E, through

made to mesh with corresponding spur-wheels on the differential shaft, from which the power is conveyed to the rear road-wheels by the usual duplicate set of chains and chain-wheels. The change speed gear is enclosed in a dust-proof oil-containing case of aluminium. Steering is controlled by an inclined hand-wheel, on the pillar of which are mounted the levers controlling the motor and variable gear. The driver has three pedals under his control—one in connection with a throttle on the inlet pipe, one for shipping the belt on to the loose pulley, and one for shipping the belt and applying a powerful band brake on the differential shaft. The belt-shipping arrangement is so devised as to bring the belt on to the loose pulley from either the inner or outer driving pulley. A hand-lever at the side of the car actuates band brakes on drums

FIG. 46.—SECTION OF DELAHAYE MOTOR.

which a pre-determined amount of oil is admitted at the end of each suction stroke of the piston. Coming now to the transmission mechanism, it may be stated here that three speeds forward and a reverse motion are provided, controlled by two levers mounted on the steering column. The engine-shaft is equipped with a wide pulley, which is connected with either of three pulleys on the differential counter-shaft by a single belt. The outer of the three pulleys (1, Fig. 47) is keyed on the differential shaft, and when the belt is shipped on to it the high speed is obtained. The inner pulley (2) runs loose on the shaft, so that when the belt is on it the engine is thrown out of connection

FIG. 47.—SECTION OF DELAHAYE CHANGE-SPEED GEAR.

attached to the hubs of each of the rear road-wheels. The frame is built low, and as the wheel base is long, a high speed may be attained without danger. The road-wheels are of the artillery type, all being 30 in. in diameter, and shod with pneumatic tyres. The next car we examined was a *tonneau* identical with the one above described, with the exception that it was fitted with a two-

cylinder engine developing 12-h.p. at a speed of 1,200 revolutions per minute. Of the old type Delahaye cars—that is to say, belt-driven vehicles with the engine at the rear—three were shown: an 8-h.p. single-cylinder car with *coupe* body convertible to victoria, having three speeds and a reverse obtained by means of two belts and gear wheels; a 10-h.p. double-cylinder vehicle with double phaeton body, and a 10-12 h.p. large break capable of seating six persons.

We are glad to find a firm of the standing of Messrs. Ransomes, Sims, and Jefferies taking up the construction of automobile machines for horticultural work, for, having now taken this step, it can only be a question of a short time ere attention will be devoted to self-moving agricultural machines. For some time past the firm have been experimenting with a motor lawn-mowing and rolling machine, and at the Exhibition they have on view an example of the type finally decided upon, and of which an illustration is given in Fig. 48. The machine is very simple in construction, compact in arrangement, and can easily be understood by any gardener or groundman. It consists of a 42-inch

its own length, enabling it to cut round flower-beds, etc. The machine can travel up to 5½ miles per hour, the petrol tank having a capacity sufficient for a run of six hours. The grass-box is emptied without stopping the machine by a special arrangement operated by the driver without leaving the seat. One man can work and manage the machine with perfect ease, and can get over much more work during the day than when using a horse-power lawn-mower. Not only is the horse and its consequent hoof-marks on the grass thus dispensed with, but also the man or boy required to lead the horse.

The stand of Messrs. Crossley Bros., Limited, was lighted by electricity, one of the firm's O.E. type of high-speed electric lighting engine, developing 12½-b.h.p. as a regular working load, being combined with a dynamo for the purpose. Messrs. Crossley also showed their "M." horizontal gas-engine, capable of developing 33-b.h.p., and their O.O. type of oil-engine of 6-b.h.p.

A. W. Gamage, Limited, had a varied display of motor accessories, clothing, sundries, etc., and it is no light task to select special items for mention where so many were included in the

FIG. 48.—RANSOME'S MOTOR LAWN MOWER.

cutting cylinder, with patent divided knives and patent single-screw adjustment, which, with the bottom blade, front rollers and box, is carried on a separate frame, hinged to the main axle, to allow it to follow the inequalities of the ground. This cutting cylinder is driven by a 6-b.h.p. Simms' petrol motor with Simms Bosch magneto ignition, mounted on the main frame, to which the driving rollers, seat, etc., are also attached. The water circulation to cool the cylinder is maintained by a pump. The power is conveyed to the rolling cylinder by means of chain gear through a reducing arrangement, which is furnished with a simple gear for starting and stopping the machine quite independent of the motor. There is also a separate clutch for putting the cutting cylinder out of gear when it is required to roll the grass only. The driver sits on a spring seat behind the machine, his weight being carried by a pair of steering rollers. He has perfect control over every part of the machine, the handles and levers for starting, stopping, steering, and emptying the grass-box being arranged so as to be easily within reach from the seat. The steering arrangement is such that the machine can turn in

range of exhibits. Clothing was an important feature of the exhibit, comprehending everything requisite, from foot muffs to mica shields, with veils for the protection of ladies' faces when riding. Ear-guards to withstand frost in cold latitudes were also exhibited. There was a varied assortment of pumps, including one pattern fitted with nozzles adapted for different makes of valves, tool bags and baskets, the "Vincent" folding jack, odometers, oilcans, lamps, brackets, etc.

At the stand of the Auto-Lubrine Company tests were made during the Exhibition demonstrating that the speciality of the company—a motor cylinder oil known as Auto-Lubrine—remains fluid at a temperature below zero. Auto-Lubrine has a high flash point, and, while not solidifying when subject to intense cold, does not lose its lubricating properties at exceptionally high temperatures. It is free from acid, and has the advantage of not leaving any deposit on the valves or plugs. The fact that Auto-Lubrine is clean in use has been amply demonstrated by some tests we have been able to make on our own car where it has proved very satisfactory.

Messrs. Humber, Limited, exhibited one each of their new 12-h.p. four-cylinder and 8-h.p. two-cylinder cars, which are of entirely new design throughout; also a chassis of the 12-h.p. four-cylinder. Close inspection proved that the firm has made a great advance since the Exhibition of last year, when they exhibited voiturettes with $4\frac{1}{2}$ -h.p. engines. The new cars are beauti-

the water jacket above the head. The cylinders are $3\frac{1}{2}$ -inch bore by 4-inch stroke, and the normal speed is 900 revolutions per minute. Both tube and electric ignition are fitted, and a float-feed carburettor with gravity-feed is used. The exhaust valve cam shaft lies outside the crank chamber and terminates at the forward end in the governor which operates a hit and miss control on the

FIG. 49.—THE HUMBER 12 H.P. TONNEAU.

fully finished, and every care has been taken in designing them, all parts being easy of access. Particularly is this so in connection with those parts which require the most attention. The 12-h.p. four-cylinder car was fitted with a Limousine body and a covered-in top, making the two rear seats practically into a brougham, the front seats being protected with an overhead canopy with a glass front. The 8-h.p. two-cylinder car had a roomy and luxurious body of the *tonneau* type, with extra baskets at the sides for carrying spare parts, etc. The 12 h.p. chassis was

exhaust valves. A semi-rotary pump is fixed beneath the crank chamber and is worked by a crank pin on the end of the cam shaft. The regulation of the speed of the engine in traffic is effected by a throttle valve on the admission operated by hand. The valves can be readily removed by simply taking off two nuts. The carburettor has a neat and effective means of removing the cover to inspect the vaporising chamber, the loosening of the thumb screws at the side being all that is necessary. The

FIG. 50.—ELEVATION AND PLAN OF FRAME OF HUMBER CAR, SHOWING GEAR-CASE CRADLE.

shown as an example of the quality of material and work put into the cars. The wood wheels were left the natural colour, and most of the metal portions were also finished up to the point of receiving their first coat of paint. All the working parts of the engine, gears, brakes, etc., were open to view, so that intending purchasers could see the interior workmanship. The motor (Figs. 51 and 52) comprises four cylinders, in two pairs, each pair being last in one piece, but having an aluminium plate to form the top of

FIG. 51.—SECTION OF HUMBER MOTOR.

friction clutch is made of aluminium, leather lined, the power being transmitted through it to a change-speed gear which furnishes four forward and one reverse speeds, all actuated by one lever, although an extra lever is fitted, so that the intermediate spur wheel for the reverse can be thrown out altogether, if required. The first motion shaft, which is placed in the centre

line of the frame, carries the sliding pinion, and the second shaft driven by it is in the same horizontal plane on the left-hand side. The power is then transmitted through a universally-jointed shaft and bevel gearing to the live rear axle. The universal joints are made with steel pins of large diameter, having phosphor bronze centres, completely enclosed in a dustproof case with oil bath. A double-acting band brake, actuated by a foot pedal, is fitted on the second motion shaft; it is made of a series of blocks of hard phosphor

FIG. 52.—ELEVATION OF HUMBER FOUR-CYLINDER MOTOR.

bronze, which press upon a malleable iron drum. The band brakes on the hubs of the rear wheels are brought into play by a flexible steel cord, passing from one brake round a pulley mounted on the brake lever, to the other side brake, and thus giving a compensating action between the two double-acting brakes. Artillery wheels, fitted with 32 by 3½ in. Michelin tyres are used. The ends of the live axle on which the driving wheels are mounted are square in section. The tubular frame (Fig. 50) is on the girder principle, the design having been registered. In connection with it there is also an arrangement whereby the gear case is fitted in a cradle so as to be readily removed when necessary. After disconnecting the longitudinal shaft and removing four bolts, the cradle, with the gear box, can be removed bodily from the car. The engine is designed to lie low in the frame, enabling a rakish bonnet to be fitted. The latter is hinged from the dashboard, and simply by undoing two spring attachments it can be flung up and the whole engine exposed to view. In conjunction with this, also, the firm use their hinged radiator, which swings down in front of the car, leaving the whole of the engine, carburettor, water tank, pump and other working parts easy of access for any

FIG. 53.—THE HUMBER CHAIN-DRIVEN MOTOR-BICYCLE.

attention required. Another point to which reference may be made is an open steering wheel, which only has one arm instead of the three or four generally used. By this means the controlling levers are placed within a few inches of the driver's hands and can be readily manipulated. The wheel base of the 12-h.p. car is 7 ft., and the weight about 17 cwt. The general arrangement of the 8-h.p. car is identical with the one above described, the only difference being that it is fitted with an engine having two cylinders 4 in. diameter by 4 in. stroke. It weighs, complete, about 15 cwt.

The Humber Company also displayed two types of motor-bicycles, one being chain-driven (Fig. 53) and the other belt-driven. The first is fitted with a 2-h.p. motor, which is so constructed as to form a portion of the frame, being let into the tube which runs from the head to the bottom bracket. The power is taken from a small chain wheel containing a cushioning spring clutch on the engine shaft, to the crank bracket, and thence by a separate chain on the left-hand side to the driving wheel. The usual foot driving chain is retained on the right-hand side. Free wheels are fitted, which permit the machine to run downhill without using the motor, and without the cranks revolving. The machine can be pedalled, when necessary, as an ordinary cycle. The petrol tank and carburettor, as also the lubricating oil tank, are carried within the main frame. A pump is connected to the latter tank, to permit the motor to be lubricated without the rider having to dismount. The engine develops about 2-h.p. at a speed of 1,500 to 1,800 revolutions per minute. Another special feature in this machine is that there is a small pawl working on a ratchet wheel, which can be disengaged by the foot without dismounting, enabling the machine to be pedalled as an ordinary cycle. This is especially useful in the case of running short of petrol, etc., there being no need to disconnect any part of the motor or chain to pedal the machine easily. The machine is controlled by a small button-topped rod and screw regulator, placed on the top tube in front of the rider. The left-hand button regulates the mixture of petrol and air, and the right-hand rod controls the speed of machine, regulating the half compression for starting and the forward ignition for speed. The current is switched on or off by the brake lever, on the right-hand side of the handlebar. By slightly pulling this lever the circuit is broken, and by a further pull a rim brake is applied on the front wheel. A new departure was to be seen in a motor-tricycle, which as regards engine and frame follows the lines of the Humber chain-driven motor-bicycle, a pair of wheels and balance gear being attached to the rear frame in place of the bicycle's back wheel and forks. This makes a light and easily-pedalled tricycle, which is furnished with substantial footrests, and a band brake on the balance gear applied by depressing a pedal lever. The "Beeston-Humber" belt-driven bicycle with Minerva 1½-h.p. engine was also shown, but this is too well known to need description at this time.

A new motor-bicycle, of Swiss design and construction, was to be seen at the stand of the Geneva Motor Company. Illustrations of the machine are given in Fig. 54. The motor, which is of the air-cooled type, developing 1½-h.p., is supported by a hinged joint from the crank case to an extension of the bottom bracket. On the engine shaft is a leather-faced pulley which drives the tyre of the rear-wheel by frictional contact. A long lever is provided,

FIG. 54.—THE GENEVA MOTOR-BICYCLE.

by means of which the whole engine can be moved through a small distance, and the leather-faced pulley moved away from, or put in contact with the tyre. A spray type of carburettor is used. The frame of the machine is of strong construction, duplicate front forks being used. The petrol tank contains 6 pints, said to be sufficient for a run of about 120 miles. The oil-reservoir contains one litre (1¾ pints), the crank chamber being filled with lubricant by means of a pump. The machine complete weighs about 85 to 90 lbs.

A useful display of axles, ball and roller bearing hubs, frames and gears was made by Mr. J. R. Churchill. Conspicuous among other exhibits was the *chassis* of a car for goods conveyance, fitted with axles, artillery wheels with solid-rubber tyres, ball and roller bearings, hubs, inclined screw steering gear and ball joint connections. He had also on view a frame with a "bee-line attachment" for the driving wheels of vehicles. Each driving wheel is carried by a pivoted link of special design. The links can swing independently on an axis parallel with that of a transverse countershaft, and also with the axes of the driving wheels. The wheels run loose on axles forming part of the links. By this device Mr. Churchill claims to prevent all side stresses from reaching the springs, thus securing resiliency and easy running. The combination ball and roller bearing hub, described and illustrated in our issue of the 12th ult., was also shown.

Although Messrs. Carless, Capel and Co. made a display similar to that with which they attracted notice in 1901, it proved attractive to practical motorists visiting the Exhibition. Of course, samples of petrol were prominently placed, including a 700 sp. gr. petrol, specially suitable for tropical countries, while information was given daily with regard to the other mineral spirits specially prepared for use in spirit motors. A

the idea has been, by adopting an angular rim in combination with the formation of the rubber, to obviate the breaking away of the tyre. The rubber is not pinched by the edges of the rim, and it cannot get cut on them. The lines of force from a side pressure strike the angular rim and rebound, wedging the tyre more securely in the rim in proportion to any strain put upon it. Specimens shown included 2½ and 3 inch Buffer tyres, as well as a set for use on motor-cars destined for public service around Johannesburg. These tyres are now being fitted for some of the fast cars, including the Napier, and also on the driving wheels of voituresses. We hear that the president of a provincial automobile club has recently adopted the Buffer tyres on his Serpollet car.

Peugeot cars form the whole of the exhibit of Messrs. Friswell, Limited. Naturally, the new models with the engine in front instead of at the rear were given a prominent place. First we examined the Baby Peugeot, of which a description and illustration was given in our issue of January 25th last. This little vehicle is meeting with a large sale among those requiring a two-seated car at a moderately low price. The motive power is supplied by a vertical single-cylinder engine of 5-h.p., carried under a bonnet under the fore part of a tubular frame. The cylinder has a dia-

FIG. 55.—PLAN OF PEUGEOT 10-H.P. CAR.

speciality shown was Carline, an oil of great viscosity and high flash point, suitable for high-speed motors and air-cooled engines. Lubricating oils, lubricating grease, gear-case oil, spindle oils, etc., were also shown. Other special features included the firm's petrol storage tanks and receptacles for the conveyance of petrol, oils, etc. One of the attractions at this stand was a patent benzine safety lamp suitable for lighting motor-car houses, or for use in any buildings where inflammable materials are stored. The lamp is constructed on the principle of the Davy safety lamp, which is the interposition of a fine wire gauze between the internal flame and the external atmosphere, the action of the wire gauze being to radiate or dissipate any heat from the flame, and so reducing the temperature much below that necessary for the firing of an explosive mixture of air and petrol vapour. The burner consists of a double wick raised and lowered from below, and it is ignited by the flame produced by striking a portion of prepared cotton which is carried in a small metal box; the lamp can thus be lit without opening it to the outside air—an undoubted great advantage.

The first tyres seen in the Hall were the patent Buffer tyres of the Sirdar Rubber Company, Limited. In designing these

meter of 3½ in., the stroke being 3½ in. The ignition is electrical, while the water circulation is maintained by pump and radiators. The governor acts both on the admission pipe and the ignition. Two speeds forward and a reverse motion, controlled by a single lever at the side, are provided. The engine is connected by a friction clutch to the gear box, while from the latter the power is conveyed to the rear "live" axle by a universally-jointed shaft and bevel gear. A pedal, located close to the driver's foot, actuates a powerful band-brake on the differential gear; while there are hand-operated band-brakes on drums connected to the hubs of each of the rear road wheels. Inclined wheel steering, equal-sized road wheels of the cycle type, pneumatic tyres (650 × 65) are other features of the little car, which weighs complete about 5½ cwt. Of the 8 h.p. Peugeot cars two were shown—a *tonneau* and a double phaeton. This is fitted with a double-cylinder engine, which is set in the fore part of a low-built channel steel frame, under a Mors-like bonnet. The engine, which runs at a normal speed of about 750 revolutions per minute, is fitted with duplicate ignition arrangements—incandescent tube, and the Simms-Bosch magneto-electric; pump and radiators maintain the water circulation, a feature of the gear-driven pump being

its location in such a position that it cannot be damaged. As regards the transmission, three speeds forward and reverse motion, controlled by one lever, are provided, the arrangement adopted being very similar to that of the Panhard and Daimler systems—that is to say, the engine transmits its power to the rear road wheels through the medium of a friction clutch, gear box, differential countershaft, and the usual duplicate set of chains and chain wheels. The car, which weighs complete about 14 cwt., is fitted with inclined wheel steering, pedal and hand-lever operated

FIG. 56.—THE 10-H.P. PEUGEOT CAR.

band brakes, equal-sized artillery type road wheels, and 90 mm. pneumatic tyres. The leading novelty on Messrs. Friswell's stand was a new 10-h.p. Peugeot *tonneau* (Figs. 55 and 56), the first of the kind in this country. This car has a four-cylinder motor which is normally rated at 10-h.p., but develops up to 15-h.p. The inlet valves do not depend on the suction stroke of the piston, but are mechanically operated. The water circulation is maintained by a gear-driven pump and radiator, the water tank being located under the bonnet. The transmission follows the lines adopted in the 8-h.p. cars, but four speeds and reverse motion are provided, all controlled by one lever. The change gear is not of the sliding type, the gears being always in mesh, any one pair being made to drive by means of a sliding feather. The road wheels are of the artillery type, equal sized, and shod with stout pneumatic tyres. Three double-acting band-brakes are provided. The car, which weighs complete about 15½ cwt., is unusually quiet in operation. Finally, we may refer to an 8-h.p. landaulet with the engine at the rear, a type of car which is largely used in France.

Messrs. Th. Botiaux and Co., who are well known in France as builders of motor-car bodies, had an example of their workmanship on view in the shape of a well-finished *tonneau* body. Considerable interest was also shown in the Rassiner brake for motor-cars, of which it may be remembered we published a description with illustration in our issue of March 22nd last. The feature of the brake is the adoption of rolling friction instead of plain sliding friction. The device is composed of an annular ring, fixed either to the hub or to the spokes of the rear wheel, a bracket bolted to the axle and a lever, which is fulcrumed on a short shaft to press the rollers against the surfaces of the ring, which turns between them. The brake is certainly extremely simple, and appears to be effective; it is claimed that it cannot "fire," and that neither grease nor mud can affect its efficiency.

The old firm of Hurst and Lloyd has changed its title to Lloyd and Plaister. Their exhibit in the Gallery consisted of a couple of well-finished petrol motors. First we noticed a four-cylinder engine having cylinders 4 in. diameter by 5 in. stroke, and developing 18-h.p. at a normal speed of 900 revolutions. The two-cylinder motor is of similar dimensions as regards the cylinder diameter and stroke. The cylinders and heads are cast in a single piece, and the two to one gear, which operates the exhaust valves, is enclosed in the crank case. The latter is provided with a large manhole to afford access to the cranks and connecting-rods.

The "Still" system of electrical vehicles, exhibited by the Canadian Electric Vehicle Company, has already been dealt with at length in these columns. We first examined a 10-h.p. sporting

dogcart to accommodate four persons, and finished in two-coloured natural woods. It is fitted with an 80-cell (8-plate) Ideal battery for 200 volt circuit. A handsomely finished 10-h.p. landaulette to carry four persons inside and two outside was next inspected. This car is fitted with a battery of forty 16-plate Ideal cells, and has five speeds forward and reverse. The third car on the stand was an 8-h.p. electric wagonette to accommodate nine persons, finished in royal blue and black, picked out with old gold. This vehicle is specially constructed for country work or as a shooting car. Its battery and general arrangements are similar to the landaulette referred to above. The motor employed is of the well-known Still type, in which the fields revolve in one direction and the armature the other. This enables the motor to be made considerably lighter than usual, and also gives a differential action, so that no differential gear is required. In addition to the cars an example of the Still 4-h.p. 50-volt duplex electric motor was shown; also an 8-h.p. motor of the same type, and one of Still's patent six-speed reversible controllers. On the same stand was displayed a number of "Ideal" accumulators, for which Messrs. Shippey Brothers, Limited, are sole selling agents. They are put up in sets of 80, 100, 120, 150, and 200 ampere hour capacities, and 100 and 200 volt charging circuits. The feature of the "Ideal" battery is the use of an expansion plate, by means of which the cells are claimed to be able to withstand a heavy discharge rate without depreciation. A special light-weight set of accumulators is made by the firm for sparking coils, while an 8-volt set was shown specially adapted for the lighting of motor and other carriages.

Mors and Renault cars formed the exhibit of the Roadway Autocar Company, Limited. Of the former, one was a 10-h.p. "all-weather" car; the second was of the same horse-power, but fitted with *tonneau* body and landau top, while the third was a 6-h.p. *tonneau*. The Mors vehicles have already been dealt with at length in the *Journal*, but it may be mentioned that in the small size the power is supplied by a two-cylinder water-cooled engine, the cylinders being placed opposite to one another across the front of the frame, so that the two piston rods work on to a central crankshaft. The ignition spark is furnished by a magnet, while a governor and radiating coil are also provided. Three speeds forward and a reverse motion are available, the engine transmitting its power through a friction-clutch to the variable gear box, located towards the rear of the frame. From the

FIG. 57.—ELEVATION OF 8-H.P. RENAULT CAR.

differential countershaft duplicate sets of chains and chain wheels convey the power to the rear road wheels. Ample brake power is provided, there being altogether three brakes. Considerable interest was shown in the 4½-h.p. Renault car fitted with a light wickerwork top, converting the vehicle into a handy little parcels delivery van. Of the 8-h.p. Renault cars (Fig. 57)—the 1902 model—only a *chassis* was staged, but this attracted considerable attention. A description of this vehicle will be found in our issue of December 28th last.

Celluloid cells were the main feature of interest to motorists on the stand occupied by Messrs. Greenberg and Sons. This firm make a speciality of celluloid goods of every description, and, in addition to cells, have a celluloid separator for the plates of batteries.

In order to emphasise the fact that they only supply the trade, the East London Rubber Company modestly enclosed their stand from the gaze of the casual observer. Within was a complete selection of motor-car tyres, Aster, De Dion, and Kelecolm engines, coils, batteries, sparking plugs, accumulators, gear-boxes, lamps, horns, etc. Motor clothing was also on view, as well as a motor under-carriage. The company have a considerable business in automobile accessories.

Accessories, oils, etc., were shown by Messrs. G. Skudder and Co., whose specialities include "Gripolene" belt cream and "Skudderlene" lubricant. Oils for water-cooled motors, gear-boxes, and chains, bearings, and cylinders were also on the stand, as well as a selection of rotary pumps, valves, spanners, jointing, and rings, and motor-car requisites generally.

The exhibit of Mr. C. T. Crowden was of a varied character, and included a two-cylinder water-cooled motor with governed exhaust, a pair of strongly-built artillery wheels, and renewable gears for Daimler change-gear sleeves. Amongst other features

In conjunction with a 14-foot boat, Messrs. Lister and Sons showed a 2½-h.p. "Popular" motor, others of the "Popular" petrol marine motor at the stand being a 2½-h.p. and also a 4-h.p. engine. These are of the two-cycle type, with water-jacketed cylinders and cylinder heads. The 2½-h.p. motor will work at 500 revolutions per minute, and the whole weight is 165 lbs.

A general selection of cylinder, valve, engine, and lubricating oils, together with lubricators, oilers, and grease cups, etc., was shown by Messrs. W. H. Wilcox and Co., Limited. The Penberthy injectors for the boilers of steam vehicles and the ejectors for lifting and delivering the water supply were also on view. Messrs. Wilcox and Co., Limited, have a large selection of lifting jacks and screwing tackle for motor-cars, and general engineering stores and sundries completed their varied display.

The largely-used Benz motor-cars are kept well to the front by Messrs. Hewetson, Limited, who had nearly a dozen cars of different types on view. As announced in our issue of the 8th March last, the 1902 models have undergone a considerable

FIG. 58.—THE BENZ 10-H.P. DOUBLE PHAETON.

of this exhibit were a steering joint, and one of Mr. Crowden's cooling radiators, both of which have been described in the *Journal*.

The Carlton Motor Company had a varied exhibit of small motors, motor parts, and accessories, prominent among which was the carburettor which we described and illustrated in a recent issue. It will be remembered that it is a mixing device combined with the inlet valve. The Carlton 5-h.p. vertical motor is on De Dion lines. The cylinder is water jacketed, the whole being cast together with the valve chest in one casting of special pot metal mixture. The inlet valve and its seating is made detachable, and when removed from the cylinder casting permits the exhaust valve to be removed from its position. The water jacket extends all round the valve chest, so as to keep the valves as cool as possible. Each bearing is provided with an oil cup so arranged that the oil, which is contained in the crank chamber, and is splashed about by the fly wheels and crank shaft during revolution, is caught by the oil cups, thus automatically lubricating the main bearings.

change, the engine being now located under a bonnet in the fore part of the frame. In the issue mentioned we gave a fairly complete description of the new arrangement, the comprehension of which will be facilitated by the sectional elevation and plan of the 15 h.p. car given herewith (Figs. 59 and 60). The cars in question vary from 10 to 20 h.p., a chassis of the latter being exhibited. All very closely resemble each other in disposition. The engine is in all its essential features the same as the former type, consisting of two cylinders, the piston rods of which work on to a central crank-shaft, the valve boxes being arranged at the side of the ends of the cylinders, and the exhaust valves operated by double-jointed levers from a double cam on the half-speed shaft. The electric ignition can be advanced or retarded by a lever controlled from the driver's seat in the ordinary way. Two trembler coils are provided, one for each cylinder. With the exception of the 20-h.p. car, the new Benz vehicles are not provided with governors, but are controlled by a hand lever arranged under the driver's seat, which acts upon a throttle on the admission pipe. On the 20-h.p. car a governor is employed to perform

this operation automatically, while at the same time it can be cut out in order to accelerate when required. A further new departure is the employment of inclined steering pillars instead of the vertical form that has hitherto been adopted. A further peculiarity of the engine on the 20-h.p. car is

and is adapted to carry a load of 25 cwt. At this stand was also to be seen the Hewetson 1½-h.p. motor-bicycle, which has already been illustrated and described in these columns. The frame is of special strength, and the machine has an extended wheel base, which enables a long driving-belt to be employed. A special

feature is the attachment of the driven pulley, which, instead of being secured to the spokes of the rear wheel, is built up from a separate and independent hub, so relieving the spokes from strain.

Two interesting little cars were to be seen at the stand of Garages, Limited. One of these is the Oldsmobile, of which an illustration and description have already been given in the *Journal*. It may be mentioned, however, that the motive power is supplied by a 4-h.p. horizontal motor. Electric ignition is employed, the timing being effected by a small lever on the right-hand side of the seat. The petrol and water tanks are arranged at the rear, side by side with the silencer, which is of very large dimensions. Two speeds forward and a reverse motion are provided, the power being transmitted through a gear of the Crypto type and a chain, the latter working on to a chain wheel over the balance gear on the enclosed live axle. The low speed is thrown into action by tightening a band round the Crypto, the power on the high gear being transmitted direct. The body is mounted on long spring arms, the extremities of which are connected with the

front and rear axles. The rear wheels run on roller bearings, and the front wheels on balls, and all four are shod with single-tube pneumatic tyres. The petrol tank holds four gallons, which supply is said to be sufficient for a run of 100 miles over average roads. The base of the steering lever is connected with the front wheels through a spring, which absorbs all vibration caused by irregularities in the road. The motor is started, while sitting in the carriage, by means of a stationary crank at the end of the seat. The

that the half-speed shaft is worked from the crank shaft by side skew gearing, and operates the exhaust valves directly instead of through the intermediary of double-jointed levers operated by a double cam, as in the case of the smaller cars. In all the cars the valves are mounted so as to be separately detachable, and can be got at and removed without interfering with any other essential part of the motor. The transmission is by belt drive with fast and loose pulleys from the engine shaft to a countershaft, which forms part of an enclosed change-speed gear of the Panhard type arranged transversely, from the second shaft of which the power is conveyed to the rear road wheels by the usual duplicate set of chains and chain wheels. The belt with the fast and loose pulleys takes the place of the friction clutch in other types of car, and arrangements are made by which the belt is thrown on to the loose pulley by a foot lever when the change-speed gear is to be operated by the lever. Four speeds forward and a reverse motion are provided, while a pedal actuates a band-brake on the countershaft, and a hand lever double-acting band-brakes on drums attached to the hubs of the rear road wheels. Of the 10-h.p. size, a chassis was shown in addition to a complete tonneau and a double phaeton (Fig. 58), while a similar car to the latter, but with 15-h.p. engine, was also staged. The 10-h.p. car weighs about 15 cwt., the 15-h.p. 19 cwt., and the 20-h.p. 21 cwt., the latter being able to attain a speed of 42 to 44 miles per hour on a good level road. Another vehicle on the stand was fitted with a 7-h.p. double-cylinder engine, located at the rear of the frame, while later in the week a 7-h.p. lorry of the type illustrated in the *Journal* about a year ago was brought into the Hall. This is fitted with a single-cylinder motor in the fore part,

speeds are controlled by one lever, which is moved forward for the forward speeds and backward for the reverse. The highest speed is obtained by increasing the speed of the motor; this is accomplished by means of a foot lever, which acts upon the governor, and also by varying the time at which the ignition takes place.

The second car was a Baker two-seated electrical phaeton, also of American construction. The frame is of tubular construction, the motor being supported at about the centre, and driving the rear live axle by means of a centrally-located chain. The motor, which is of the multipolar type, is constructed with special windings, and will, it is claimed, stand any load the battery will

fitted as desired. The petrol tank has a capacity sufficient for a run of 170 miles. The machine appears to be of sound construction, and we shall probably give an illustration of it at a later date.

Considerable interest was shewn during the week in the chassis of the new four-cylinder car of the New Orleans Motor Company, Limited. A brief description of this vehicle has already

been published in the *Journal*, but it may be mentioned that the motor is carried under a bonnet in the forepart of a tubular frame. (See Fig. 63). The engine has four separate cylinders, mounted on a single crank chamber. The cylinders are 100mm. in diameter by 105mm. stroke; a governor, which acts on the admission, is provided, it being located in an independent gear case filled with oil. The water circulation is maintained by a gear-driven pump and radiator, while the carburettor is of the Sthenos float-feed type. The engine transmits its power through a pedal operated friction clutch to the change-gear box and thence by a universally jointed shaft and bevel gearing direct to the rear axle. The change gear wheels are of exceptional width, while the shafts of the same run in long and well-lubricated bearings. The forward

speeds are controlled by a lever at the side, a separate handle being provided to control the reverse. One of the chief features of the change-gear is that a change from any one speed to another can be made without the other two speeds being passed. For instance, speed can be changed from the fourth speed to the first, missing the third and second gears. The rotation of the clutch is checked whenever the speed is changed by the primary application of a

furnish without "burning" out. The controller, which is simple and practically non-sparking, is adapted to give three speeds, the maximum being 16 miles per hour. A battery is provided having a capacity sufficient to run the vehicle a distance of 40 miles on one charge. The car, which is fitted with cycle-type wheels and pneumatic tyres, weighs complete about 8 cwt.

A new four-seated *vis-a-vis* car—the Ilford—made its first public appearance at the Show at the stand of the Ilford Motor Car and Cycle Company. It is propelled by a 5-h.p. M.M.C. motor set in the fore part of the frame, and driving the rear axle through a friction clutch, gear box, and bevel gearing. Three speeds and a reverse motion are available, a lever controlling the forward and a pedal the backward motion. The water circulation is maintained by a chain-driven pump and a radiator. An inclined hand-wheel controls the steering; ample brakes are provided. The road wheels are of the artillery type, shod with Clipper-Michelin pneumatic tyres. The Ilford Company also staged a Regina motor-tricycle, fitted with a 1½-h.p. engine arranged vertically in front of the bottom bracket, the frame of the machine being of special construction. The rear pulley is secured to the rim, and motion is transmitted by a wide flat belt.

The latter is adjusted by the rear fork-ends, and the chain by means of a jockey pulley. The machine has a triple head, switch on the left handle, Bowden exhaust valve lifter, sight-feed pump lubricator, and Roubeau spray carburettor. The front brake acts on the rim, and at the back either rim brake or back-peddalling can be

leather lined brake on the end of an extension of the gear-shaft at the rear end of the gear box. Adjustable ball joints are fitted to the steering rods. Equal sized road wheels of the artillery type are employed. As to the brakes, a pedal controls one of the band type on the rear end of the longitudinal shaft, while a hand lever

FIG. 61.—THE NEW ORLEANS 9-H.P. TONNEAU.

FIG. 62.—PLAN OF NEW ORLEANS 9-H.P. CAR.

at the side actuates band brakes on each of the hubs of the rear road wheels. Altogether the car appears to have been well thought out, the workmanship being of the highest order. A four-seated *tonneau* on similar lines, but fitted with a two-cylinder motor, developing 9-h.p., was also staged, Figs. 61 and 62. In this vehicle three speeds and a reverse are provided, the car complete weighing about 10 cwt. Another *tonneau* had a 8-h.p. two-cylinder motor, while finally we may mention the well-known

FIG. 63.—PLAN OF NEW ORLEANS FOUR-CYLINDER CAR.

3½-h.p. two-seated *voiturette*, of which a large number are in use up and down the country.

Messrs. J. W. and T. Connolly had a good collection of wheels fitted with their "Ideal" rubber tyres. These can be applied to all existing rims, and have been adopted by some of the leading motor-car firms with great success. The tyres are held on the rim by means of two electrically-welded wires in such a way that it is claimed that the tyres cannot come off the rims or creep. The tyres are now being made in sizes for heavy vehicles. Samples of the tyres were shown fitted to both wood and steel wire-spoked wheels. The firm also made daily demonstrations of their system of electrical welding.

Messrs. Dalton and Wade made a first appearance at the Motor-Car Exhibition, introducing a new petrol motor known as the "Daw." It is intended for motor-bicycles, and is of 1½-h.p., fitted with large valves, and having a large bearing and wearing surface. A rocking arm operates the exhaust valve stem in place of the cam commonly employed. The "Daw" combined exhaust valve gear and lifter was also shown, the idea being to thus increase the durability of the valve gear, which has to withstand more shocks and wear than any other part of the small petrol motor. The general arrangement of this device will be seen from Figs. 64, 65, and 66. When the cam C is in position, as shown dotted, the exhaust valve is opened and closed in the ordinary way through the lever A, which pivots about B. By raising C into a

vertical position the lever A is prevented from falling and the exhaust valve thus kept open. Other exhibits on Messrs. Dalton and Wade's stand included a brush-spraying carburettor. Different types of steering wheels, aluminium and phosphor bronze castings

FIGS. 64, 65, AND 66.—ELEVATIONS OF DAW MOTOR, SHOWING EXHAUST VALVE LIFTER.

for motor-cars, and also a selection of cylinder castings, of which line the firm seem to be making a speciality, completed the display.

A new electrical accumulator or storage battery known as the "Max" was exhibited by the Société des Accumulateurs Electriques "Max" (Ruphy and Co.), who inform us that it has been adopted by the French Ministry of Marine, after a series of very severe tests at the Central Laboratory in Paris. The special feature of the accumulator is the cylindrical form of the electrodes, which are made of a core of lead wire laminated with antimony, surrounded by active material, and protected by a covering or coating of asbestos, which prevents the disintegration of the active material. These electrodes are held vertically by pieces of ebonite and lead, of serpentine shape, associating one with the other, so

FIGS. 67 AND 68.—THE "MAX" ACCUMULATOR.

that a positive always finds itself surrounded by negatives and *vice versa*. The electrodes are entirely manufactured by mechanical processes which ensure a uniformity of production. The battery is claimed to possess all the requisite qualities, such as high capacities, long duration, lightness and cleanliness. It is made in a wide range of sizes, the 1,800 ampere-hour battery discharging at the rate of 50 amperes for 36 hours, the weight being about 400 lbs.

Lubricators of various kinds were shown by Messrs. Hunt and Mitton. These included a needle syphon with clear glass body and gun-metal mountings, improved positive feed plunger and sight feed injector lubricators, and polished brass oil distributing boxes.

The Gobron-Brillie cars exhibited by Messrs. Botwood have a

ratchet actuated by a hit-and-miss lever on the governor shaft, in such a manner that absolutely no more petrol is consumed than the exact quantity required. There are certain peculiarities in the construction of this feed which enable the user to employ either ordinary petrol, alcohol, benzoline, or any inflammable spirit without alteration. It is also stated that in case of emer-

FIG. 69.—THE GOBRON-BRILLIÉ 12 H.P. TONNEAU.

well-earned reputation, which, judging from the vehicles displayed, should be well maintained by the 1902 models. The leading novelty was the new 12 h.p. car, with the engine under the bonnet in the fore part of the frame (Fig. 69). To enable visitors to inspect the details they wisely included in their exhibits a complete chassis without body, in which the motor and mechanism can be readily inspected. The engine (Fig. 70), which is located at the front end of the frame, is of the vertical type; while there are only two cylinders there are four pistons, the explosions taking place between them. The piston rods of the

FIG. 70.—SECTIONAL ELEVATIONS OF GOBRON-BRILLIÉ MOTOR.

upper pair are attached to a cross-head *h*, which in turn is connected by side levers to the crankshaft below, the arrangement being claimed to overcome the difficulty of vibration. Electrical ignition is adopted, while the ordinary carburettor is replaced by a cone, on the face of which are cut out a number of small buckets or "aveoles"; this cone is seated into another cone in which the first revolves in such a manner that the buckets are filled with petrol, which is drawn into the explosion chamber at a further portion of the revolution. This measurer is rotated by a small

agency even gin, brandy, whiskey, etc., or a mixture of any of these, can be used without giving heed to what fuel may remain in the tank. A governor, which can be acted upon by a small handle, is also provided, regulating not only the air supply and advance of electric spark, but also controlling the supply of the petrol through the positive feed. All the working parts of the motor are securely enclosed in an aluminium dust-proof box. The speed of the motor may be regulated by the aforementioned handle on the steering pillar to any speed between 250 and 1,300 revolutions per minute. The cylinders are water-cooled, a pump and radiator being fitted. The inlet and exhaust valves are situated one above the other, and by removing a single bolt the two pairs of valves can be quickly taken out. Three speeds forward and a reverse motion controlled by a single lever are provided. The engine transmits its power through a pedal-operated friction-clutch to the change gear box, in which are a train of sliding gear-wheels, any one of which can be made to mesh with corresponding pinions on the countershaft. The gears are generally calculated for speeds of thirty, eighteen, or eight miles per hour with the motor running one thousand revolutions per minute. Bevel gearing connects the countershaft with the differential cross-shaft, from which the power is conveyed by a duplicate set of chains and chain wheels to the rear road wheels. The frame of the car is of a special form, built of steel tubing. Steering is controlled by an inclined hand-wheel. There is a powerful brake located in the rear of the frame (Fig. 71), and an 8 h.p. four-seated wagonette. These cars were dealt with at length in our report of the 1901 Exhibition at the Agricultural Hall, so that it will suffice to mention that, as regards the transmission, a large spur-wheel on the engine shaft gears with a pinion on a countershaft, which carries, in an oil-containing box, a train of spur-wheels, any one of which can be brought into gear with corresponding wheels on the parallel differential shaft, from which two chains

transmit the power to the rear road wheels. The reverse motion is obtained by means of a small pinion which can be interposed between the two gears giving the low speed. Finally, we may refer to the 8 h.p. Duc tonneau, on the same system as the new 12 h.p. car, the principal difference being that instead of using chains, the power is transmitted from the gear-box direct to the

FIG. 71.—THE GOBRON-BRILLIE 12-H.P. CHAR-A-BANC.

rear axle by a universally-jointed shaft and bevel gearing. As for the carriage work of all the vehicles staged, this is of the highest class.

"Charette" cars were well to the fore on the stand of the International Motor Company, they being shown in phaeton, spider, *tonneau*, and double phaeton. The general arrangement of these cars has already been described and illustrated in the *Journal*, but it may be mentioned that they are fitted with a 6 h.p. vertical motor placed in the front of the car. The water-cooling is maintained by a pump and radiator. The power is transmitted by wide and long belts from the engine to a small countershaft at the extreme rear of the frame, and thence by gear to the live axle. The frame is channel steel and tube, and the wheels are tangent, metal spoked, built up on ball bearings. A new pattern that the International Company has lately put on the market is the "Armstrong" *tonneau* (Fig. 72). This is driven by an 8 h.p. single-cylinder, slow-speed engine, the water-jacket extending around the valve chambers as well as the cylinder. Both the inlet and exhaust valves are mounted on the top of the explosion chamber, and are arranged that they can be readily taken out when necessary. The water circulation is maintained by a chain-driven pump and an Accles-De Veulle radiator. The carburettor is of the Comiot float-feed type. The engine is set in the fore part of a channel steel frame, and transmits its power to the gear-box through a pedal-operated friction clutch. The gear-box is connected with the rear live axle by a universally-jointed shaft and bevel gearing. Three speeds forward and a reverse motion are provided, a feature of the change gear

being that on the high-speed none of the gear wheels are in use, the engine driving the rear axle direct, the latter running on four ball bearings. Steering is controlled by an inclined hand wheel, while both hand and foot brakes are provided. The road wheels are of the cycle type, all 30 in. in diameter, and shod with pneumatic tyres. The *tonneau* body has high backs, and is both roomy and comfortable. On this stand was also to be seen an example of the "Mountaineer" motor-bicycle, the 2 h.p. motor of which is attached above the bottom bracket with the engine inclined forward. It has rectangular radiators for cooling the cylinder; the sparking plug is placed in the centre of the combustion head, and the exhaust valve is raised by the same lever as retards the sparking, a ratchet being furnished to hold the lever wherever it may be placed. The carburettor is of the surface type, and has needle valve communication with the reservoir. A gravity feed lubricator is carried on the right hand side of the head. The left handle twists to make and break the circuit. The frame is of strong construction, especially as to the front fork, and both wheels are fitted with large tyres and hand-applied rim brakes. The power is conveyed to the rear wheel by a special flat-belt built up of three layers of leather riveted together. The front pulley has oblique transverse grooves, and the back pulley is fixed to the rim of the wheel by means of independent spokes.

Costumes for ladies who indulge in motoring attracted many to the stand occupied by Mr. Charles R. Base, whose enterprise in catering for automobilists is being recognised in an expanding business. Fur coats for motorists were a special feature of his display, and neat liv-ries for the servants of automobilists were

FIG. 72.—THE "ARMSTRONG" CAR.

also on view. Double-breasted leather Chesterfields with Melton collars and wool lined, leather-lined suits of waterproof tweeds, and lined with brown calf or lamb skin, a dust coat for summer wear, gentlemen's leather vests of sheepskin with or without sleeves, caps with mud shields, and gloves provided other features of interest shown by Mr. Base.

Quite a new steam car to the English market is that shown by M. E. Chaboche, whose system has been in use in France for some years past. Fig. 73 shows the 6-h.p. car, seating two or four persons, in which the boiler is located at the rear, ordinary petrol being used as fuel. An automatic device is fitted to regulate the fire, while a large condenser is provided, which enables a run of sixty miles to be made without it being necessary to refill the

FIG. 73.—THE CHABOCHE 6-H.P. STEAM CAR.

water tank. A horizontal double-cylinder enclosed steam engine, developing 6-h.p., is located about the centre of the frame, and is connected to the rear axle through a two-speed gear, universally-jointed shafts, and bevel gear. Fig. 74 shows the Chaboche *tonneau*, to seat six or eight persons. The general arrangement in this vehicle is similar to the steam delivery van illustrated and described at length in our issue of January 18th last, so that a lengthy reference is unnecessary. We may mention, however, that the vertical boiler is of the semi-flash type with two coils of water-tubes. It has four square metres of heating surface. Situated in the front part of the vehicle, it is contained in a neat box or bonnet sufficiently low to offer no obstruction to the view of the driver. The feed water is injected by air pressure. Under the driver's seat is an iron cylinder into which air is pumped to a pressure of 10 kilos. above piston, and water is then pumped below the piston until the pressure is raised to 20 kilos. The cylinder or reservoir communicates with the boiler by means of a valve, and when the pressure in the boiler falls below 20 kilos. the water is forced into the generator, this action being practically continuous. The feed pump meanwhile is sending water into the cylinder until the normal pressure is reached and the surplus passes back into the tank. It is fired with coal, which is stored in small paper bags on each side, the capacity being sufficient for a run of 120 miles, that of the water tank sufficing for 30 miles. The *tonneau* is propelled by a two-cylinder double-acting engine of 12-h.p., inclined slightly out of the horizontal and situated under the driver's seat. The engine is bolted to the side of the

frame, with the crank shaft in a longitudinal position, and gear-
ing by a two-speed gear on to the countershaft, which in turn is connected to the rear axle by a centrally-located chain. Forced lubrication is employed for all the working parts, this being done by a hand wheel screwing down on a piston. The engine and gear are enclosed in a dust-proof box.

A single example of the Allard light car formed the exhibit of Messrs. Allard and Company. It was fitted with a double phaeton body, and was provided with a 9-h.p. single-cylinder motor, located in the fore part of the frame. The explosive mixture is furnished by a Comiot float-feed carburettor, while the water circulation is maintained by pump and radiator, the latter being of the Julien type, of which an illustrated description was given in these columns a few months ago. Three speeds forward and one reverse are provided, the engine transmitting its power through a pedal-operated friction clutch to the change gear box, and thence by a universally-jointed shaft and bevel-gearing to the rear axle. A noteworthy feature of the change-gear is that none of the gears are used on the top speed, the engine driving the rear axle direct. The car, which is steered by an inclined hand-wheel, is

provided with two double-acting brakes, actuated respectively by pedal and hand lever. The road wheels are of the artillery type, equal size, and shod with pneumatic tyres. The vehicle has a neat appearance, and weighs complete about 12 cwt.

A roadside tyre repair outfit known as the "L. K." was shown by the Nottingham Cycle Company, Limited. The feature of this special shield is also known in connection with cycling, and its adaptation in a larger and stronger form for motor-cars is a

FIG. 74.—THE CHABOCHE 12-H.P. STEAM TONNEAU.

matter of interest. Hooks on the edge of the shield secure a permanent attachment.

Motor chains from half-inch to three-inch pitch were exhibited by the Coventry Chain Company, Limited. In one type, that of 2½ inch pitch, for heavy vehicles, special lubricating arrangements are provided, the pins having detachable screws at one extremity, giving facilities for properly lubricating the chain bearings.

Messrs. Shippey Bros., Limited, had a large stand, on which a couple of the well-known Milwaukee steam cars were well displayed. These vehicles, which were described at length in our report of the 1901 show, have been brought up to date. They are equipped with a new type 5-h.p. (nominal) engine; shell steel boiler tested up to 1,000 lbs. cold water pressure; Kelly burner and generator lighted by a match; automatic pump; water alarm; side steering; sight-feed lubricator; feed-water heater; water lifter; Klinger gauge glass; and electric gauge glass lights. The petrol tank has a capacity of 6 gallons, and the water tank 30 gallons. The engine has no ball bearings. All the main bearings, including the crosshead and wrist pin, are adjustable for wear, and can be easily renewed when worn. All bearings are steel, running in bronze, no bearing having both surfaces composed of the same metal. The crosshead and wrist pin are oiled from a reservoir on the crosshead. Messrs. Shippey also displayed a 5-h.p. standard engine, a 5½-h.p. new 1902 model engine with outside eccentric cylinders, 3 in. diameter by 3½ in. stroke, a Milwaukee 16½ in. by 14 in. tubular boiler, containing 350 copper tubes, a 16 in. Kelly burner and generator as used on the Milwaukee cars, and a general assortment of American steam car sundries.

The Collier twin tyre for motor-vehicles was shown by the Collier Twin Tyre Company, Limited. In this tyre the canvas walls of the tyre parts are carried underneath and vulcanised in the usual way. Part is used to form an arm on each side, or tread to hold the rubber in its place. These arms are then laced together by ligatures passing right through the rubber tread. Consequently, the rubber tread is helped by a triple

FIG. 75.—SECTION OF COLLIER TYRE.

force, viz., the vulcanisation to the canvas, the arms, which terminate in a beading, and the ligatures, which pass through the rubber tread from one arm to the other. It is claimed that in this combination of a pneumatic and solid tyre the narrow tread makes the tyre a fast one, and results in very little dust being made, whilst skidding is greatly minimised. The special form of fastening adopted prevents creeping, thus removing the chief cause of the bursting of the inner tube. At this stand were the tyres from the car "Antrona," whose recent trips in the west of England have been recorded in the *Journal*. These have been run 3,500 miles over roads of every description, and the condition in which they were exhibited was testimony to their strength and durability. The Collier Tyre Company showed for the first time a new patch for repairing holes in tubes. This is composed of red rubber, to which is attached an outer skin of grey rubber.

Messrs. Mack Bros. came from Surrey to show their double-breasted ulsters and Norfolk, admirably designed with a view of protecting the chest when motoring. Neatly lined with serviceable tweed, and well waterproofed, the coats proved attractive to many visitors.

Garlio is becoming known as a useful duster cloth for the machinery of automobiles, in fact for all kinds of engineering purposes. It absorbs oil, grease, etc., in much the same way that ink is absorbed by blotting paper, its constituent being a specially prepared silk. Not only was it to be seen on the stand of the makers, but elsewhere in the show we saw it actually in use by exhibitors. The material is made up into squares of 15 and 25 inches, and supplied in three qualities.

Quite a new departure in motor pneumatic tyre construction

FIG. 76.—SECTION OF JACKSON'S DUPLICATE TYRE.

is that which is being introduced by Jackson's Duplicate Tyre Syndicate, Limited. The illustration showing a cross section of the tyre (Fig. 76), together with a diagram of the band attachment (Fig. 77), will sufficiently explain its construction. The advantages claimed by the Syndicate are: In the event of a puncture, the second tube taking the place of the punctured one is inflated, and the repair left until home or a stop is made. Should the second tube subsequently puncture, the outer cover can be repaired, and the tube or tubes inflated, as it is claimed that the attachment is perfectly air-tight. Other claims made are special wearing qualities, narrow tread, impossibility of detachment, and long life. The tyre, which is to be made in all sizes, is held in position by means of two bands, one on each side, secured by a screw and bolts. To withdraw the inner tubes it is only necessary to release the band-screw, and take out the bolt on one side only. The double inner tube arrangement is said not to interfere with the resiliency of the tyre—rather the reverse. There can be no doubt that durable motor tyres are the question of the hour, and if the claims made for the one under notice are fully borne out in practice, it should have a big future. A set of the Jackson tyres

FIG. 77.—ATTACHMENT OF JACKSON'S TYRE.

has been in use on a car for some time past with, we are informed, successful results.

Aluminium motor castings formed the bulk of the display made by the Birmingham Aluminium Casting Company, Limited. This company is making a special feature of motor castings in aluminium, and is apparently well equipped for the purpose, a report on tests of its aluminium joints by Mr. P. L. Renouf, circulated at its stand, giving a very high opinion of its work.

(To be continued.)

EXHIBITION ECHOES.

On Friday Mr. Loxton Hunter arrived at the Hall from his End to End trip, having come from Doncaster on that day.

ONE great improvement on exhibitions held in London was the prohibition by the promoter of the sale of papers by boys and others perambulating the hall. Thus there was an absence of noise and turmoil that is often a feature of such shows, and, as the regulation was respected in practically every case, the rule was doubtless appreciated by exhibitors.

IN the gallery the *County Gentleman* had a stand whereon was a collection of country sketches of considerable interest.

ON the last day of the Show, nearly fifty of the workmen from the Coventry works of the Daimler Company visited the Exhibition. A large number of the employees of the Lanchester Company were also brought up to the Show. These firms are to be congratulated on thus endeavouring to educate their employees as to what is being done in the motor-car industry.

ONE lady of solemn visage called at a stand and said she wanted a car just to potter about in—to go at not more than three miles an hour. The attendant suggested a bath chair.

ON Saturday the Locomobile Company exhibited cards recording orders from the Marquis of Salisbury and Sir George Newnes, Bart.

Photo 191

"LE PASSE PARTOUT" AT THE EXHIBITION. DR. LEHWEß AT THE WHEEL.

Argent Archer.

As the week wore on the appearance of the yard at the Barford Street entrance grew in animation, and, at times, recalled the busy scene that was witnessed last year when the presence of the arena seemed to attract a large number of cars. Some enterprising exhibitors arranged for duplicate cars to be in the vicinity of the Hall, so that they could give trial trips to interested inquirers on the actual road—far more conclusive and satisfactory tests than are possible on gravel walks or grassy slopes.

IF retail firms were satisfied with the business they did, the wholesale houses were gratified by the number of good inquiries they received—a dual proof of the splendid business results achieved.

SIR THOMAS LIPTON has entrusted Mr. Oliver Stanton with an order for a 22-h.p. Daimler car. We understand that it will be delivered early in July.

ABOUT six o'clock on Saturday evening the Hall resounded with the hooting of horns as Dr. Lehweß drove out on *Le Passe Partout*—to begin the first stage of his long journey, interest in which was considerably accentuated by the announcement in last week's *Journal* as to the Argyll challenge.

THE attendance was well maintained to the last, and on Saturday a large number of distinguished people were present. Just before the evening dinner hour more than a dozen titled people were in the hall, and over a score of carriages bearing armorial crests were waiting outside.

As we mentioned last week, the visit of the Prince of Wales on Wednesday during the Show proved a very popular incident in the week's display. His Royal Highness was much interested in the Exhibition, and at the close of his inspection expressed his gratification at what he had seen. Mr. E. Manville had the honour of explaining the details of the King's car

to the Prince of Wales, whose adhesion to the ranks of owners may be anticipated ere long.

"THE Prince of Wales, attended by Commander Godfrey-Faussett, visited the Motor Car Exhibition, at the Royal Agricultural Hall, Islington." Such is the entry in the *Court Circular*, relative to the visit of his Royal Highness, on the 23rd ult.

IN the course of a chat with Mr. Belcher, he informed us that the motor department of Messrs. Humber, Limited, will shortly be removed from Coventry to Beeston, where new works especially intended for the construction of motor-cars are being established.

LAST week we published a list of distinguished public men who visited the Exhibition. A supplementary list we have prepared includes the following: The Prince of Hesse, the Earl of Derby, Lord Enfield, Lord Suffield, Earl Craven, Lord Robert Cecil, Baron Leopold de Rothschild, Sir Redvers Buller, Right Hon. Sir J. H. A. Macdonald, Sir Thomas Lipton, Sir E. Jenkinson, and Mr. Lionel de Rothschild.

AMONG M.P.'s whose adhesion to the ranks of motorists was made known at the Show are Lord Willoughby de Eresby, Sir George Newnes, Sir J. Dixon-Poynder, and Colonel H. McCalmont. But the greatest tribute to the progress of automobilism is the fact that a steam car was ordered for the Marquis of Salisbury by Lord Robert Cecil.

THE horses of the Prince of Wales seem well accustomed to the presence of motor-cars. During the hour that His Royal Highness remained within the hall, the horses were in the yard surrounded by "all sorts and conditions" of automobiles. They never murmured nor gyrated in an emotional fashion, but affected an indifference which fitted in well with their princely dignity.

ONE of the best articles which has appeared in the London daily papers on motoring was published as a leader in the *Daily News* on the 24th ult.—being called forth by the Exhibition at the Agricultural Hall. Thanks to the publicity accorded by the Press, the Exhibition has had a wonderful effect in educating the public.

MRS. LANGTRY was amongst the well-known visitors to the Exhibition on the day the Prince of Wales attended. Mrs. Brown Potter, too, not only visited the Exhibition, but also purchased a car.

THE Agricultural Hall presented a busy yet changed appearance on Monday, when it was being cleared of the motor-cars, ready for another exhibition. From the Minor Hall several of the heavy steam vehicles marched away under steam, but one or two of them required the aid of horses, which, eventually, they will largely replace.

ONE of the gossip topics among the exhibitors at the Show was the metamorphosis two well-known members of the trade had undergone. *Sans moustache*, one hardly recognised them!

A SATISFACTORY feature of the Show was the promptitude of the stand attendants in the early morning. Almost as soon as the gates were opened all the stands were uncovered and dusted, ready to receive visitors. By 10.30 on several mornings we noticed would-be clients going through the details of the chassis displayed.

WHILE the Prince of Wales was visiting the Exhibition an amusing passage at arms took place between an attendant at one

of the stands and the Hon. C. S. Rolls, who, in answer to a query of His Royal Highness, mentioned that up to the present French tyres had proved the most satisfactory. "Excuse me, sir," said the stall attendant, "have you ever tried our tyres?" "No," said the Hon. C. S. Rolls. "Then, sir," came the sharp reply of the Irishman, "you have yet to learn who makes the best tyres." The Prince laughed heartily, and the Hon. C. S. Rolls promised to try a set of the suggested tyres on one of his cars.

BETWEEN Thursday evening and Friday mid-day a Salisbury search lamp was missed from Le Passe Partout at the Exhibition. Seeing that it had not the proper fittings, and is therefore useless to anyone, its loss is hardly to be understood. Messrs. Salisbury and Sons will be glad to hear from anyone who can trace its present whereabouts.

AUTOMOBILISTS to the number of 653 have been licensed by the municipal authorities of Philadelphia, U.S.A.

THE Austrian Automobile Club is organising a hill-climbing competition from Neuwaldegg to Exelberg for the 8th May.

THE municipal authorities of Milan have just granted licences for fifteen electric cabs to ply for hire in that city.

CARPETOPOLIS—generally known as Kidderminster—has a local supplier of petrol, etc., in Mr. R. Jenkins, of the Bull Ring.

THE City Council of Hartford, Conn., U.S.A., have decided to purchase an electrical motor ambulance from the Electric Vehicle Company.

MR. P. A. WAGNER has been appointed manager of the new motor-car and accessories department lately established by Harrods, Limited, in Brompton Road, S.W.

FROM his depots at Lancaster, Kendal, and Morecambe, Mr. W. Atkinson is able to supply accessories, spare parts, etc., for motorists visiting that part of the country.

GENERAL ALEXANDER, of Boothby Hall, Burgh, Lincolnshire, is the latest addition to the ranks of motorists, he having just purchased a 10-h.p. Georges Richard limousine from Messrs. Mann and Overton.

THE New York Tyre Company, Limited, have sent us a copy of a new booklet they have just issued. It contains particulars of the New York tyre, and full instructions as to the fixing and repair of the same.

THE SIMMS MANUFACTURING COMPANY, LIMITED, inform us that the Daimler Motoren Gesellschaft, of Cannstatt, are not now using the Bergmann magneto electric machines for ignition purposes, but only those of the Simms-Bosch system.

MOTORING tourists in North Wales will be glad to learn that special provision for motor-cars has been established at the Oakeley Arms Hotel, at Tan-y-Bwlch, one of the most romantic parts of the country. Within easy distance there are many famous places of historic note.

MESSRS. CARLESS, CAPEL AND LEONARD have just issued a new edition of their little handbook on "Petrol, What Petrol Is, and Where it May be Obtained." Over three hundred names and addresses have been added to the list of firms keeping a stock of petrol, so that motorists would do well to write for a copy of the booklet.

MRS. LEWIS WALLER, who is at present playing "Zaza" at the Croydon Theatre, is finding the motor-car very useful in getting to and from her house in Regent's Park and the theatre. She is using a car made by Messrs. Bradbury Bros., of Croydon, and has been able to get home, after the play, in much less time than by train.

TENDERS are being invited by the War Office until the 31st of July next for the supply of a self-propelled lorry for military purposes, driven by an internal combustion engine using oil of not less than 100 deg. F. flash point (Abel's close test) as fuel. Specifications of the required vehicle can be obtained on application to the Director of Army Contracts, War Office, Pall Mall, London, S.W., to whom tenders are to be sent.

CONTINENTAL NOTES.

BY AUTOMAN.

WHILST the Exhibition question is interesting to the motor world in England, it may be useful to refer to the position of affairs in Belgium, where rival exhibitions have been held this spring. In the first place, it is necessary to explain that for nine or ten years a company called La Societe

show, which was held, as far as my memory serves me, in the month of March, 1901, the Automobile Club of Belgium and the Chambre Syndicale de l'Automobile, considering that these exhibitions had developed entirely into motor-car shows, wished to join in and have some control over them. The Societe Auto-Velo met them with a refusal, so the A.C.B. and the Syndicate organised a rival show. A building was taken, far more suitable, in that there was more space, and there was a part contiguous

THE ARRIVAL AT NICE OF HERR PORSCHE ON THE LOHNER-PORSCHE COMBINATION PETROL-ELECTRIC CAR.

M. WERNER ON 40-H.P. MERCEDES IN THE NICE-LA TURBIE RACE.

ON THE ROAD BETWEEN VENTIMIGLIA AND CUNEO.

THE NICE WEEK.

[Allgemeine Automobil Zeitung.]

Royal Auto-Velo has held exhibitions which were originally cycle shows, but which within the last few years have developed into motor-car shows with a few bicycles added. These shows were held in Brussels, and of late years in a public building called the Po'e Nord which has become inadequate, as far as space is concerned, for the requirements of the trade. After last year's

in which the cars could be run. Now, with all these conditions, the natural inference would be that the new exhibition would entirely eclipse that organised by the older body, but that is just where the peculiar part of the story comes in. The Automobile Club, the Chambre Syndicale de l'Automobile, and the manufacturers had not reckoned that one very important element,

namely, the public. The public was accustomed to the Pole Nord exhibition, which was not quite so far away from the centre of the city as the other one. The two exhibitions were held just about the same time, and, though undoubtedly the better and more representative of the two was that held by the recognised automobile authorities, there was no crowd of visitors to admire it, the public going in a mass to the show they were used to, and making it an unqualified success.

A BANQUET was given at the Hôtel de Russie, in Paris, last week to M. Leon Serpollet, to celebrate his record run at Nice. The well-known motorist, in recounting the details of the ride, said that he was "a little nervous before the start, because I had not been able to test my machine over the course beforehand. I knew the car was all right, and I knew how to get the maximum out of it. I was quite calm at the moment of departure; a second or two later I was conscious of a sensation of speed that can only be called fearful. In all my previous experiences I have been able to fairly well calculate the speed at which I was going by the whistling of the air in my ears, but this time I heard and saw nothing."

PRECISELY because the "Northern Circuit" is being organised officially by the French Government, some doubts had been lurking in the minds of motorists as to whether the contest would provide a really genuine high-speed race. Uncertainty reigned at first with regard to certain conditions of the contest, which might, it was thought, hamper the fast cars; but this has been explained away. The Northern Circuit programme has been divided into three distinct events. These are a "consumption contest" for tourist vehicles, a second competition of a similar kind for vans and luggage carriers, and, thirdly, a race properly so-called. The various regulations regarding the estimation of the quantities of alcohol consumed apply only to the two first contests. The third is to be run according to the ordinary racing regulations of the French Automobile Club, with the sole extra stipulation that methylated alcohol, not petrol, is to be used in the engines. The legal limit police enactments will, of course, be suspended in favour of competitors in the race, though, apparently, this will not be the case, in theory, at all events, with the two other contests. There is every prospect, therefore, that the Northern Circuit speed competition will provide as good a race as the Paris-Bordeaux of past years.

THE promoters of the "Northern Circuit" contest are benefiting by the prohibition of the Nice-Abbazia race. The event arranged by the French Ministry of Agriculture for May 15th, 16th, and 17th next will indirectly derive increased importance from the action of the Italian authorities. All the principal French and German makers had built numbers of new vehicles specially for Nice-Abbazia. These are now being entered for the Northern Circuit, which accordingly promises to be a much larger event than was at first expected.

BARON HENRI DE ROTHSCHILD is reported to be having built a special motor-car built on a plan drawn up by himself. His object is to construct a motor-car which shall be a distinct improvement on all existing models, combining the advantages of the Mercedes and the Panhard. It will be of 30-h.p.

M. DUPUY, the French Minister of Agriculture, has given a subsidy of £140 for the construction of an apparatus to be used in the international motor-car competitions. This is the first remarkable proof of official recognition in such matters. The apparatus is for the precise determination of the motive power of the motor-cars, and with its assistance it is expected that absolute regularity will be ensured in gauging results as to speed.

IN PRAISE OF THE MOTOR-CYCLE.

I toil 'mid the steam and the smoke,
And machinery encompasseth me round;
My hands and my face are made black,
In my ears a buzzer-like sound.
While only a few miles away
Old Nature is lovely and green;
The landscape is wooing me now
To gaze on the beautiful scene.
In the ev'ning, when labour is o'er,
I walk down the hard flagg'd street,
And hard is the clatter of wheels,
And hard are some faces I meet.
Oh, how can I roam in the fields,
And pursue my own work in the town?
How can I my country explore,
And visit the scenes of renown?
Hurrah, now for science and skill!
Profound is the work of the mind—
They're building a steed for me now
Excelling the speed of the wind.
I simply will sit on a wheel,
My feet and my legs all at ease,
The engine control with my hands—
The speed will be just as I please.
My form will resemble no more
The shape of a big letter G,
But bolder and straighter shall I
Sit and ride on my motor gee-gee.
Then here's to the hills and the dales—
The upgrade's as easy as down;
Here's fifty miles off in the morn,
And fifty miles back to the town.

Cramlington, Northumberland.

MARK DONEY.

A MOTOR-BICYCLE race meeting will be held at Coventry on Whit-Monday.

THE suggestion made for a series of motor-car runs to Wolverhampton, in connection with the great Exhibition which has just been opened in that town, has been declined by the authorities in London, but the Wolverhampton and District Automobile Club should work for the movement by developing the idea as far as the Midlands are concerned.

SINCE the beginning of the present year the Bavarian postal authorities have been using an electrical motor-tricycle for the collection of letters from the street letter boxes in Munich. The results have been so successful that a second machine has been ordered for the transport of mails between the Munich G.P.O. and the railway station. Furthermore an accumulator-charging plant has been put down at the G.P.O.

THE first meeting of the season of the Aero Club of the United Kingdom will take place at the Crystal Palace to-day (Saturday) about mid-day, when two large balloons will ascend (weather permitting). The members making ascents will probably be Mr. Roger W. Wallace, K.C., the Hon. C. S. Rolls, Sir Vincent Kennett-Barrington, Mr. C. F. Pollock, and Mr. F. H. Butler. The second meeting will be held at Ranelagh on Saturday, the 31st May.

MR. ALEXANDER FISCHER, through M. Ernest Cuenod, vice-president of the Automobile Club of Switzerland, now in New York, is reported to have arranged to take practically the entire output of the George Richard factory at Paris. Two hundred cars are, it is said, to be delivered before August 1st.

PRESIDENT SHATTUCK, of the Automobile Club of America, has sent a letter to the members, based on the report of the Law Committee, urging observance of the present eight miles an hour limit. The letter says that effort will be made to have the limit raised by ordinance for unbuilt portions of New York.

HERE AND THERE.

AMONG the establishments catering for motorists on the Brighton road is Trevor Rest, at Burgess Hill.

A COMPANY has been formed to provide a club house for the use of motorists and cyclists in the Birmingham district.

MESSRS. CHARLES BINKS, Ltd., has been registered with a capital of £5,000 to carry on business as manufacturers of motor-cars, etc.

MOTORISTS journeying to Brighton are warned that the police are adopting spying methods in the neighbourhood of Reigate and Redhill.

THE Alpha Motor-Cycle Club has been organised at Brooklyn, N.Y., with nineteen members. It is the first club of the kind in the United States.

A MEETING of the shareholders of the Aberdeen District Motor Service Company, Limited, will be held on May 21st to receive an account of the winding up.

A LARGE dairy firm of Delaware County, Pa., is about to make trial of a motor vehicle for transporting its products from Concordville to Philadelphia, a distance of thirty miles.

WITH a capital of £2,000 the firm of David J. Smith and Company, Ltd., has been registered to carry on dealings in motor-cars, etc., at 5, Great Arthur Street, and at Baver Street, London, E.C.

AT Talbot House, Lichfield, Messrs. Jones and Co. stock petrol, charge batteries, execute repairs, supply spare parts, and have a garage with accommodation for a score of motor-cars.

THE Oxford Automobile Agency, 16, George Street, Oxford, inform us that they are stocking petrol, oil, grease, and spare parts, and that they are in a position to undertake repairs to any make of car.

THE General Motor-Car Company, Limited, has been registered with a capital of £1,000, to carry on the business of manufacturers of and dealers in motor-cars, electrical and mechanical engineers, etc.

WE hear that the Thornycroft Steam Wagon Company, in addition to their heavy steam vehicles, are taking up the construction of light delivery vans, propelled by internal-combustion motors.

CAPTAIN THOMAS, head of the Liverpool Fire Brigade, has expressed himself as being desirous of finding a suitable body for adoption in connection with a motor fire-engine, a fact of which manufacturers will probably take note.

MOTORISTS touring along the Suffolk coast may be interested to note that Messrs. P. W. Watson and Sons, of Lowestoft and Diss, undertake immediate repairs to axles, springs, and in fact anything that comes in the coachmaker's line.

SOME Birmingham motor-cyclists had a run to Peterborough the other day, when the presence of several trailers gave interest to the trip. At Peterborough the party was met by two riders from London, one of them being Mr. Hooydonk.

MESSRS. CHARLES S. ROLLS AND Co., in addition to their new works at Lillie Hall, Earls Court, expect shortly to open a garage in Down Street, Piccadilly, at the back of the Automobile Club's new premises, which will be open day and night.

UNDER the name "Lucabide," Messrs. Joseph Lucas, Limited, of Birmingham, are introducing a new carbide of calcium for acetylene lamps, the feature being that the carbide has a protective coating to moderate the generation of gas.

MR. CECIL EDGE started on Monday to drive a 9-h.p. Napier car 200 miles a day. This he intended to do for not less than ten days in order to demonstrate that an English-built car will run that distance every day for a period without repairs of any kind. Unfortunately, however, a failure of the steering gear on the road, near Mansfield, on Tuesday, brought the trial to a temporary close. A fresh start is to be made in a few days.

CORRESPONDENCE.

MECHANICAL FLIGHT UP-TO-DATE

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Responding to the inquiry of your "New Reader," the variable-stroke feed-pump I mentioned in Chapter V. of the above series was actuated as shown in the accompanying sketch, from which also the

method of varying the length of the stroke will be observed. There is nothing new about this piece of mechanism, as it has long been used in engine valve-gears, and for varying the feed in several machine tools. The automatic mechanism of these pumps, however, I do not feel wholly at liberty to describe.—Yours faithfully,

SIDNEY H. HOLLANDS.

A SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to "W. H. R.'s" letter in the last issue of the *Journal*, I suggested the same thing some months ago in the *English Mechanic*, and should like to see it tried. Some method of preventing freezing (owing to the cold produced by the expanding air) would have to be provided, as in the old "Mekarski" locomotives on the Wantage tramway.—Yours truly,

A. S. L.

A QUERY re PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if some of your readers with experience would tell me why small explosions keep occurring in the hot-air inlet to the carburettor. When these explosions occur the engines misfire. I have examined the inlet valves, but find they are all right, and the joints are also in order, but still these explosions occur.—Yours truly,

S. J. C.

CRACKED WATER JACKETS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the last issue of the *Journal* that Mr. Cook explains another way of repairing a cracked water jacket. I have seen this done on stationary engines, and have no doubt it makes a good sound job, but very clumsy and ugly to look at. I scarcely think a motorist who takes any pride in the appearance of his car would care to show it with a big lump

of cast metal stuck on the cylinder. I think most men would prefer a new cylinder if the crack was situated in a place impossible to repair with a plate. I see Mr. Cook thinks that a crack repaired by fitting a plate over it is likely to leak owing to vibration. From experience I have not found this to be so, but I can quite believe that unless the work was very well and carefully done it would be certain to cause trouble after a little time. I have known cracks in gas engine jackets to rust up and give no further trouble, but owing to the excessive vibration, I doubt if this would be possible in the case of an engine on a motor-car.—Yours truly,

J. WALES SMITH.

ENGLISH-BUILT MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would it not be a very good thing if you could arrange with your advertisers that where they are selling an English-made car they should state so? My reason for mentioning this is that recently, in making some enquiries for a car, I found one or two, advertised as if they were English-made cars (advertised by English companies), to be really wholly or partly foreign. It was only after some difficulty that I was able to elicit the fact that they were not English-built motor-carriages.—Yours truly,

GEO. WEBSTER.

GRADIENT WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to learn from any of your readers the gradients of Garbold Hill, which is situated about four miles from Burscough Junction on the road to Wigan. My attention was first called to this hill by a gentleman at the Liverpool Motor Show, who stated that the hill was a mile long, and parts of same were 1 in 5. He offered to purchase a quadricycle on the sole condition that it carried two persons up Garbold Hill unaided by pedalling. I have motored over most of the roads in Lancashire, and from Liverpool to London, and I have not yet (to the best of my recollection) found so severe a test for a motor. It is somewhat similar to the long rise from Grateley Station to Bulford Camp, Salisbury Plain. I have looked in the Contour Road Book, and find no reference to Garbold Hill, and am informed that no other quad with passengers had ascended it previous to my attempt.—Yours faithfully,

WILLIAM JOHNSON.

WARNINGS TO MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to warn all motorists who are likely to be on the Leels road, between Stanmingley and Bradford, against going anything more than the legal limit, as one or two motorists, including myself, have lately been fined £5 and costs. A constable seems to lie in wait during the best part of the day, and I can speak for his capabilities in bringing up witnesses who make astounding statements, which are backed up by himself. He stands at a street end and times the motorist until he rounds a bend in the road which he states to be 400 yards distant. This slipshod method of timing, together with his witnesses' estimate of the speed of the car, is taken as quite sufficient to convince the court. In my case the witness consisted of a farm labourer, who estimated my speed at thirty miles per hour, and stated that a horse in a light trap had jumped on to the pavement, that the constable had shouted for me to stop, that the man in the trap had put up his hand for me to stop, and that I had rushed on blindly through the town of Stanmingley at thirty miles per hour, and would take no notice of anyone.

Is there no justice to be had for the motorist?—Yours truly,

T. SCRIVEN.

SIR,—While driving my car in the neighbourhood of Rye House, Herts, I was directed to take a private road running through Netherfield Park, and owned by Mr. H. Lawrence Prior, and where, I was told, there would be a threepenny toll. I took the road indicated and found it a led one, loose flints all over the track making one tremble for the tyres. But my disappointment in the road was as nothing to my disgust when at the end of the park I found a keeper waiting to mulct me in toll to the sum of 1s. 6d. Noticing that the charge for a horse-drawn vehicle was 3d., I demanded to see his authority to charge me 1s. 6d., and was shown a letter in Mr. Prior's handwriting.

You might warn other motorists of this little trap, as there is no notice at the entrance to the park. It shows the attitude of some folks to the automobile when they charge six times as much for a pneumatic-tired car as they do for a horse with four iron shoes and four iron wheels pounding up the road.—Faithfully yours,

CHAS. T. CUTLER.

PUNCTURES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent issue of your journal you very frankly told us of the "inevitable puncture" on your 12-h.p. car, although it was but newly shod with a fresh set of tyres. Now, although we are so frankly assured that punctures are all a matter of luck, there must be causes at work to predispose to these accidents, and I think we might, perhaps, arrive at some of them if the circumstances attending the puncture were more systematically investigated. Those who are familiar with such mishaps might assist by telling us (a) the weight of the car; (b) the number of passengers carried;

(c) the quantity of luggage; (d) the size of tyre; (e) whether the tyre was well inflated or not; (f) whether all cuts in the outer tube had been closed up; (g) which wheel had the puncture; (h) what was the condition of the surface of the road at the moment of puncture; (i) was the exact cause of the puncture detected.

It is possible that by a collective investigation on some such lines we might arrive at some reduction in the frequency of punctures, and also might manage more correctly to make a tyre suit the weight of a car. Could not a plebiscite of readers give us their ratio of punctures, according to (a) miles run, (b) weight of car, and (c) age, make, and size of tyres?—Yours truly,

Doc.

THE BRITISH MOTOR TRACTION COMPANY, LIMITED, v. FRISWELL.

ON Wednesday last week an application was made to the Second Court of Appeal, composed of the Master of the Rolls, and Lords Justices Stirling and Cozens-Hardy, in this action, asking that the plaintiffs might be ordered to give security for the costs of their appeal. Mr. T. Terrell, K.C., for Mr. Friswell, said the case was a patent action, and it was tried before Mr. Justice Farwell on July 29th, and judgment was given for the defendant. The costs of the action were taxed at £787 15s. On April 7th a writ was put in the hands of the Sheriff, who returned *nulla bona*, and on the 12th of the month a petition was presented to wind up the company. In the meantime, the plaintiffs offered to pay the defendant £200 down, and the balance by bill. The learned counsel asked that the plaintiffs should give security for the costs of the appeal, which would be heavy. He suggested that £100 was a fair sum. An affidavit had been filed in which it was stated that so far as the deponent was aware the company had nothing with which to pay the costs. Mr. Bucknill, for the British Motor Traction Company, said his clients had not had time to answer the affidavit. The petition for winding up was presented by the defendant after he had refused the offer to pay £200 down and the balance by a properly secured bill. At the end of the affidavit a great point was made that a large number of other actions had been prosecuted by the plaintiff company, but, as a matter of fact, all those actions had been stayed until after the hearing of this appeal. The plaintiffs were ready to give security for £50. The Master of the Rolls said he did not think security for £100 was too much, and that sum must be given. On the application of Mr. Terrell, the costs of the application were ordered to be costs in the appeal, which would stand out of the paper until security was given.

MOTOR MANUFACTURING COMPANY, LIMITED.

In their report to the shareholders at the extraordinary general meeting on Thursday last, the directors (Messrs. Roger Wallace, K.C., F. E. Beadle, and M. H. Buckea) said:—The delay in issuing the report and accounts has arisen partly through prolonged negotiations with the directors of the Daimler Company, with a view of amalgamating the two companies, and, when these negotiations had definitely fallen through, further delay naturally occurred owing to the necessity of formulating a good scheme for the future working of the company. The amount of cash obtained when the company was formed in 1900 was £37,300, and in round figures £36,920 was spent in paying off the old company's debts and purchasing new machinery, tools, etc. From May 30th, 1900, to May 30th, 1901, a loss of £7,410 15s. 1d. was incurred, but from May 31st to October 31st last the loss was £470, a very marked improvement. A considerable amount of money had to be expended during the period covered by the accounts in improving the company's motor vehicles, but it is believed that the company's present standard types will be saleable for some time to come. These types will, of course, always be kept quite up to date in order to meet current demands. The standard types are as follows:—The M.M.C. single cylinder voiturette, the M.M.C. 7 h.p. light car (two cylinders), the M.M.C. 10-h.p. car (two cylinders), the M.M.C. 12-h.p. car (four cylinders). The sales during the twelve months ending March 31st, 1902, show an increase of 68.53 per cent. over the previous similar period. The total orders from January 1st, 1902, to March 31st were £29,076 16s. 9d. These figures will give a very good idea of the extent of the business which the company is now doing. The Board are of opinion that it is absolutely essential that further capital should be raised, and in November last they called together all the chief shareholders and carefully explained to them the company's position. At that meeting a committee was appointed from the shareholders present. Since that time several meetings of the committee have been held and many schemes discussed, and the committee and your directors, after mature consideration, have arrived at the conclusion that the only satisfactory way of dealing with the position is to permanently place the company on a thoroughly sound commercial basis by considerably reducing the present large capital of £300,000. It is therefore proposed to form a new company with a capital of £80,000, divided into 320,000 shares of 5s. each. Every existing shareholder will be entitled to receive one 5s. share, credited with 3s. paid in the new company, for every share held in the present company. It is proposed that the first mortgage debt of £15,000 should be continued. This arrangement ensures a sum of £25,296 12s. cash to be received by the new company; this will be available as follows:—1. To repay the £6,000 temporarily advanced by Messrs. C. and F. E. Beadle. 2. To erect a new smithy and assembling shop at the works at an estimated cost of about £3,200. The balance, less the expenses of reconstruction, will be available for increased working capital; under these conditions, and with the present outlook, the directors confidently

expect that the company will speedily become a dividend-paying concern. The new company will also have available 67,034 shares for future issue, and some of these it is proposed to issue as soon as possible. The directors have to report that on December 14th, 1901, Mr. John H. Gretton, resigned the chairmanship of the company and his seat on the board, and Mr. Roger W. Wallace, K.C., on January 1st of this year, accepted the chairmanship of the company.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION, LIMITED.

THE annual general meeting of this Association was held on Thursday, 24th ult., at the Agricultural Hall, Islington, when there was a good attendance of members. The chairman (Mr. J. J. Mann) reported on the satisfactory work done by the Association, and detailed the services rendered to a large number of its members, who had claimed its assistance by way of advice in matters involving trade questions, including the alleged infringement of patent rights, and in other matters which come within the scope of the objects. He drew attention to the part taken by the Association in undertaking the defence in the action, in which a member of the Association was the defendant and the British Motor Traction Company, Limited, were plaintiffs. The case arose out of the claim which the latter set up to a monopoly of the Maybach carburettor patent. The result of the action, which extended over three days, was a triumphant victory in the interests of the trade generally, many of whom would have been several hundred pounds a year poorer in respect of royalties they would have had to pay had the case terminated otherwise. Special attention was also drawn to the work done by the Association in connection with the Exhibition question, and the protection of members in respect of advertising in new trade journals, and other work of similar importance. The accounts and report were adopted by an unanimous vote, and satisfaction was expressed at the successful manner in which the secretary had kept down the office expenses.

The following gentlemen were unanimously elected additional members of the committee: Mr. A. E. Hodgson, President of the Gardner Serpollet Chief Depot; Mr. E. Shrapnell Smith, of the Road Carrying Company, Limited; Mr. Henry Spurrier, Junr., of the Lancashire Steam Motor Company. Other formal business was transacted, and the meeting terminated with a vote of thanks to the chairman.

At a meeting of the General Committee of the Association, held on Saturday last, the secretary (Mr. Geo. R. Helmore) stated that he had expressed to Lord Shrewsbury the unanimous desire of the Committee that he would accept the presidency of the Association, and that Lord Shrewsbury had kindly intimated his willingness to accept the office. It was thereupon unanimously resolved, on the motion of the chairman (Mr. J. J. Mann), and seconded by Mr. E. Shrapnell Smith, "that the Right Honourable The Earl of Shrewsbury and Talbot be and is hereby elected president of the Automobile Mutual Protection Association, Limited."

ATTACKING A JEWELLER'S SHOP.

LAST week we reported the first hearing of a charge against O. E. Lord, of Arundel Mansions, Fulham, S.W., at the Marlborough Street Police Court, of furiously driving a motor-car, with being in possession of a loaded revolver while drunk, and with causing bodily harm to Henry Meirach, a Russian Pole. At the adjourned hearing police-constable Hadden deposed that he saw the car run into No. 91, Regent Street, smashing the shop front to pieces. After further evidence, the case was remanded for a fortnight, bail being allowed in two sureties of £100 each.

HILL-CLIMBING AND CONSUMPTION TRIALS.

On Saturday next, the 10th inst., an important trial, open to all vehicles, is to be held by the A.C.G.B.I., principally with the object of giving makers and agents an opportunity of subjecting their vehicles to official trial at an early date in the spring. The trial is open to all vehicles. The vehicles entered for the trial will have an opportunity of endeavouring to make two non-stop runs of about thirty miles each, in connection with which the consumption of fuel will be measured, and also of proving their hill-climbing efficiency, and the consumption of fuel during a hill ascent amounting to four miles in all. The vehicles will assemble at 9.0 a.m. at the Belgravia Garage, close to Victoria Station, when the fuel tanks will be filled and the cars and cycles weighed. At 10.0 a.m. a start will be made for a non-stop run of 33 miles, via Ealing, Southall, Uxbridge, Beaconsfield, High Wycombe, to the thirty-third milestone at the foot of Dashwood Hill. On arrival at this point, contents of fuel tanks will be drained into measures by official observers, the consumption over a run of 33 miles being thus ascertained. At 1.0 p.m. the fuel tanks will again be filled by official observers. At 1.30 p.m. the trials up the steep portion of Dashwood Hill (a measured distance of 1,173 yards) will be commenced. At the top engine may be stopped. The descent to be made by gravity; the car to be turned at the bottom, engine to be restarted, and the ascent to be repeated. When the ascent and descent have been made six times, fuel to be drained from fuel tanks into measures. The consumption over a run uphill of 4 miles, representing a total ascent of 1,300 feet, will thus be ascertained, and the average speed will be arrived at by taking a mean of the time-records of the six ascents. The fuel will again be measured into the tanks prior to the start of a return non-stop run to Norland Mews, 33 miles. The consumption

over a run of 33 miles will thus be ascertained, and a mean will be taken between the consumption on the outward run and that on the homeward run in order to arrive at consumption over an average road. The consumption of a vehicle will not be measured if it arrives at Dashwood Hill on the outward journey later than four hours after its departure from the Belgravia Garage, or on the return journey later than four hours after its departure from Dashwood Hill. It is to be noted that no vehicle will be admitted to the trial unless its fuel tank be fitted with a tap or other arrangement at the lowest point of the tank by which the contents of the tank may be entirely drawn off in reasonable time. The passing of one competing vehicle by another whilst both are descending gradients or within towns or villages is prohibited, and the vehicle of any driver who may break this regulation may be disqualified. The usual regulation as regards speed in towns, villages, etc., will be in force.

ACCORDING TO DESCRIPTION.

In the King's Bench Division, before Mr. Justice Ridley, the case of Simpson, Strickland and Co. v. Richardson was heard on the 23rd and 24th ult. The plaintiffs sought to recover from Mr. Richardson the balance of a sum of £255 due for a motor-car of the Darracq type, sold by the plaintiffs to the defendant. The defence was that the car was sold as a new 8-h.p. car, and that it turned out to be a second-hand one of only 6-h.p. The defendant counter-claimed for £85, deposit paid by him. The onus being on the defendant his case was opened first, by Mr. Foote, K.C., who said the defendant alleged that the car did not answer the description, and therefore he rejected it. There was also a counter-claim for damages the defendant had incurred by reason of the car failing to answer its description, which amounted to six guineas. In May, 1901, the defendant wrote to the plaintiffs asking for a quotation for a motor-car. The plaintiffs replied that they could supply a new 8-h.p. Darracq car for £240 nett. This was described as an 8-h.p. Darracq motor-car, with a tonneau body. As a matter of fact, what they supplied was a 6-h.p. car, which was not a new, but a second-hand one. He did not suggest that the plaintiffs sent the wrong one maliciously, but thought a mistake had been made. Mr. J. C. Crowdy, of Swindon, said with proper care the electrical part of the car ought to have lasted for 2,000 miles. When he examined the car he found many parts of it nearly worn out. Mr. Frank Wellington, motor-car expert, said he had examined the car in question. In his opinion, it was a car of only 6-h.p. It had been worn and repaired, and had been run at least 5,000 miles. For the plaintiffs, Mr. W. Worby Beaumont, C.E., gave evidence to the effect that the car was a new one, and that it had not run 5,000 miles. There were no traces of the wear alleged by the defendant. There were tool marks on the piston which would only disappear after a run of 2,000 miles. He found traces of overheating and damage for want of lubrication. When the bearing was run without proper lubrication, the parts seized, and two rough surfaces resulted. There was no real standard of horse-power for light locomotives. His Lordship inquired if he bought an 8-h.p. Darracq, did the car in question fulfil the description? Witness replied not as regarded the cylinder, but it did in the body of the car. The cylinders were made larger now. At the conclusion of the evidence judgment was given, the judge saying that if it were a case of breach of warranty, the remedy of the defendant would have been to sue for damages. But it was not such a case. It was a case of sale by description. The motor-car was sold as an 8-h.p. new car. It was proved by the weight of the evidence to be neither, and, that being so, judgment must be for the defendant. Judgment was entered for the defendant, who counter-claimed, for £93 17s. 6d., and costs.

ANOTHER move in the campaign in the United States against alleged infringers of steam vehicle patents has just been made, suit having been brought by the Whitney Manufacturing Co., of Boston, against the White Sewing Machine Co., of Cleveland. It is understood that the suit has the same basis as the one now pending against Stanley Bros., of Newton, Mass., viz., the alleged infringement of a large number of patents held by the Whitney company.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, MAY 10, 1902.

[No. 166.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN connection with the next Motor-Car Exhibition at the Agricultural Hall, from March 21st to the 28th, 1903, the inquiries for space have been so numerous as to warrant the management in making arrangements for covering the courtyard. Fully three-fourths of the ground floor space of the Great Hall has been applied for, and it is evident that the show of motor-vehicles in 1903 will be even larger than during the recent Exhibition. The gallery spaces, too, will be fully occupied.

Trials of Electric Vehicles.

THE date of the Automobile Club's trials of electric vehicles has been fixed for July 7-12 next. The trials will last five days, and cars may be entered in either of the following classes:—(1) Town carriages. (2) Country carriages weighing over 30 cwt., including accumulators. (3) Country carriages weighing under 30 cwt., including accumulators. The following routes have been selected:—(a) London to Brighton. (b) Brighton to London. (c) London to Sandown and back. (d) London to Windsor and back. (e) London to Ascot and back. (f) Special route for observations. Special optional routes will be selected for town carriages. In order to enable the Trials Committee to make efficient arrangements for the charging of cars, manufacturers of electric carriages are requested to state, as early as possible how many cars they propose to enter in the trials, and to state in respect to each car:—(a) The charging voltage at the beginning and end of charge. (b) The average current during charge. (c) The approximate time required for charging. Statements of the particulars now asked for do not bind manufacturers to enter the cars for the trials.

The Lincolnshire Club.

THE Lincolnshire Automobile Club is doing good work for the movement in the Fens, and we hope its proposed brake and hill climbing trial will prove as successful as the various other gatherings it has organised from time to time. There are sixty private members of the Club, ten of whom are doctors, and at the recent meet at Folkingham, near Sleaford, six magistrates for the county were present. The hon. secretary lately attended a meeting of the Highways Committee of the Kesteven County Council, and urged the views of automobilists with regard to the regulation of the speed of motor-cars by the Local Government Board. Such representations, if made by other local bodies and persistently followed up, will do much to guard the interests of owners of automobiles throughout the country.

The Maybach Case.

THE trade will be interested to learn that the appeal of the British Motor Traction Company in the case against Mr. Friswell has been withdrawn, the company paying costs, partly in cash and partly by bill. The patent rights in the Maybach carburettor are now a dead letter, and this result, for which the trade has anxiously waited, will be regarded as a distinct gain to the industry. The history of the litigation has been interesting, and we would congratulate the Automobile Mutual Protection Association on the part they have played in the matter. A word of praise is also due to Mr. Staplee Firth, whose conduct of the affair has added another to the many legal services he has rendered to the automobile movement.

The End of the Matter.

THE case was heard last July, in the Chancery Division of the High Court of Justice, when the British Motor Traction Company, Limited, was represented by Mr. Fletcher Moulton, K.C., while Mr. Friswell was defended by Mr. T. Terrell, K.C., and Mr. Roger Wallace, K.C., on behalf of the Automobile Mutual Protection Association. After a patient hearing, Mr. Justice Farwell delivered a judgment (fully reported in our issue of August 3rd, 1901), the conclusion of which was that the plaintiffs' claim had failed, and the action was consequently dismissed with costs. Since then there have been many rumours as to the intentions of the parties in the suit. Notice of appeal was given by the British Motor Traction Company, and it was announced that the Association was prepared to go to the House of Lords if necessary in support of a contention which they regarded as correct. Events have justified the view they took, and the trade will now probably recognise the value of an organisation whose efforts have been directed to freeing the industry from monopolies calculated to restrict the development of automobilism.

The Aero Club.

At the Crystal Palace, on Saturday, the Prince and Princess of Wales attended the first meeting of the Aero Club, when two balloon ascents were made by Messrs. C. F. Pollock, F. H. Butler, and R. W. Wallace. Twelve members have already subscribed their quota to the first balloon to be purchased by the Club, these including the Hon. C. S. Rolls, Messrs. F. H. Butler, Paris Singer, Mark Mayhew, Ballin Hinde, and Dr. F. W. Hutchinson. The second meeting of the Club will be held at Ranelagh on the 31st inst., when Mr. Patrick V. Alexander will place his balloon at the service of the Club. In connection with aeronautical matters, it may be of interest to remind members of the Aero Club that an international aeronautical meeting will take place at Berlin in Whit-week.

The Road Carrying Co., Ltd.

ON Monday the statutory meeting of the Road Carrying Company, Limited, was held at Liverpool, when the chairman, Mr. G. H. Cox, made reference to the tare question. When it was altered, as it must be ere long, the company will have the advantage of an organised traffic on which to work. In addition to the work of carrying traffic, the company is opening a light car department, and in our report on another page some of the agencies which have been acquired are set forth. With careful management the company should have a prosperous future.

The Brig o' Doon.

"THE old Brig o' Doon" has seen some changes since the day when Robert Burns went "crooning to himself" along the river bank, and composed "Tam O'Shanter," which the poet regarded as the best of all his poems. Burns was born in a little cottage about two miles to the south of Ayr, within a very short distance from Alloway Kirk and the Auld Brig o' Doon localities, immortalised in the famous poem. Our illustration shows the bridge, but the presence of the motor-car

is evidence of the changes that have been wrought since the spot was frequented by Burns. Recently Mr. Walter Creber, a well-known Scottish automobilist, took a trip in Ayrshire, and here he is shown on his Albion car.

Motors and Mongrels.

JUDGE GWILYM WILLIAMS, who presides over the Swansea County Court, has been investigating a case occasioned by the inquisitiveness of a dog belonging to Mr. D. Owens. The said dog attacked a motor-cycle, upon which Mr. R. Gold was riding, in such a way as to damage the machine (£10 15s. was the declared extent of the damage), and cause the rider to dismount with uneasy celerity. In the course of his evidence, Mr. Gold, who summoned the owner of the dog for the recovery of

damages, said he had been bitten three times by dogs, and that he had kicked off at least six dogs since Christmas. The defendant objected to his canine pet being declared guilty of a savage disposition, but all to no avail. The judge awarded damages as the plaintiff claimed, and added insult to injury by suggesting that the dog, which was a black one with white spots, was a mongrel. No wonder decent dogs do not like motors!

The Bexhill Trials.

MUCH interest is being taken in the motor-car races and speed trials to be held at Bexhill-on-Sea on Whit-Monday. Below we give the programme of events, and would refer readers to our issue of April 12th for particulars as to the definitions adopted by the Automobile Club with regard to the classification of cars, etc. Among the special vehicles which are likely to appear on the track are Mr. Alfred Harmsworth's 40-h.p. Mercedes, which was one of the features at the recent show; a steam car driven by M. Serpollet; Baron Henri de Rothschild's 40-h.p. Mercedes car, and a Wolseley car intended for the Gordon-Bennett Race. Baron Rothschild and Mons. and Madame Serpollet will stay at the Sackville Hotel during the week.

The Programme.

ENTRIES for the Automobile Club's meeting at Bexhill on Whit-Monday must be made before the 15th inst., and are restricted to members of the Club or members of clubs affiliated thereto. The programme for the tourist section will commence at 11 a.m., and includes contests for motor-bicycles, motor-tricycles, voiturettes, light cars, cars of 18 cwt. and over, tourist steam vehicles and electric tourist vehicles. At 3 p.m. the speed section will begin with a race for electric vehicles; after which will follow motor-bicycle, motor-tricycle, voiturette, and steam car races as well as contests for cars of 800 to 1,000 kilogs. For the car having the best appearance a forty guinea challenge cup, to be won two years in succession, is offered by members of the House of Commons. Other prizes include cups offered by Earl de la Warr, Mr. Mark Mayhew, L.C.C., Mr. Paris Singer, Mr. Henry Edmunds, Mr. E. J. Pape and others. The course is a kilometre long.

Forthcoming Fetes.

THE possibilities of the motor-car for floral decoration have been demonstrated on the Riviera, but they have had tardy recognition in this country. Some amend is to be made under the organisation of Mr. Imre Kiralfy, who is arranging an automobile battle of flowers to take place on June 13th in connection with a fete at Earls Court, for the benefit of certain French charities in London, under the patronage of the Prince and Princess of Wales. The suggestion has also been made that decorated cars might form a feature of a floral carnival to be held at Canterbury under the auspices of the Chamber of Trade of the ancient city. The Whitsun meeting of the Automobile Club will also comprise some new features, including an automobile masked ball, when—we quote from the official club notice—"prizes will be offered of a substantial nature for the best dominos . . . masks with ladies and gentlemen are compulsory. . . . The prizes will be given away during the evening."

The Clubs at Buxton.

WHILE the Bexhill meet of the A.C.G.B. & I. will attract motorists from the Metropolis and the South of England, there will be a large gathering of provincial automobilists at Buxton for Whitsun. A conference of the northern clubs was held at Manchester last week, under the chairmanship of Mr. W. E. Rowcliffe, Chairman of the Manchester Automobile Club, at which the Yorkshire and Manchester clubs and the Liverpool Self-Propelled Traffic Association were represented. Buxton was selected as the *point d'appui*, where members taking

part will assemble on the evening of Saturday, the 17th inst. It is intended that the programme for the other days shall be arranged when those participating have assembled at Buxton. Intimations should be sent to the local honorary secretaries by members of the various clubs who intend to take part in the run.

Highway Administration.

A FEW weeks ago we dealt at length with the question of "Highway Administration," emphasizing the necessity not only for improvement in the maintenance of the principal highways, but also for uniformity in place of the present chaos owing to county divisions. We now learn that the Leader of the House of Commons is being approached with a view to the Government granting a public inquiry into the existing system of highway administration, with special reference to its bearing upon the housing and transport questions. The view is gaining ground that "tubes" and trams are more or less expensive and unsatisfactory substitutes for broad trunk thoroughfares. No new main roads out of London, for example, have been built for many generations, although population and traffic have increased many times. At the same time the advance of the automobile has made clear the necessity for dealing with the main roads of the country in order to give fair play to the new industry in helping to solve some pressing social problems.

New Trunk Roads.

THAT the matter is likely to receive the earnest attention of legislators is pretty well assured, and the support of M.P.'s throughout the country should be enlisted for a motion which the Hon. A. Stanley, M.P., has placed upon the Agenda paper of the House of Commons. This is to the following effect:—"To call attention to the entire suspension of road building activity in England and Wales since the abolition of the Turnpike Acts; to the congestion of traffic and of population in the large towns by reason of the fact that no new trunk roads through and out of them have been constructed for several generations; to the growing difficulty and increasing cost of transporting goods by road, and their serious effect upon the industrial efficiency of the nation; and to move that, in the opinion of this House, immediate steps should be taken to facilitate the construction of new trunk roads, both by private enterprise and public authorities."

Work for Local Bodies.

THIS is a matter which should be watched with keen interest by County Councillors and all concerned with local government. Much can be done by such gentlemen to improve local conditions. In some places this has already been done, and Councillor Flynn, of Cleator Moor, is suggesting to the Cumberland Council that a suitable stone bridge be built across the Esk at Eskmeals, to enable the public to use uninterruptedly the level road along the coast between Cumberland and Lancashire from Whitehaven to Barrow. He also proposes that a joint bridge should be built across the Duddon river between The Green in Cumberland and Foxfield in Lancashire, thereby shortening the distance between Millom and Barrow by nearly six miles and more than an hour in time by avoiding some of the worst gradients in Cumberland and Lancashire. In adopting such practical ideas as are suggested by Councillor Flynn, County Councils can do useful work of national importance as well as of local value.

Automobiles at Weddings.

RECENTLY we recorded the first Society automobile wedding; now we have to chronicle the use of the motor-car as a substitute for the horse-drawn vehicle and the train for the honeymoon trip. The marriage of Mr. B. Bathurst, M.P., with Miss Ruby Spencer-Churchill was a great affair; but from our point of view the going away was even more notable.

For, instead of being restricted to the time of trains, the newly wedded pair were able to spend some time with friends before they drove, in Lady Cairns' motor-brougham, to Kenry, Lord Dunraven's place on Kingston Hill. One advantage of the automobile is that farewells can be said in a less hurried fashion than when it is generally known that time and train wait for none—not even newly-married couples.

Coach Builders and Motor-Cars.

THE discussion still continues in many quarters as to whether carriage builders should seriously interest themselves in making motor-cars, and at the annual meeting of Messrs. Forder and Company, Limited, of Wolverhampton, the chairman said that the company had been considering as to whether they should take up the business. When they were satisfied that there was a real demand for motor-cars for business or pleasure, they would have no hesitation in entering into competition with other makers. Had this gentleman been in London two or three weeks ago he would probably have realised that the manufacture of motor-cars has developed into a real substantial industry in this country. Mr. T. C. Clark suggested, at the meeting referred to, that carriage builders might very well give attention to motor-car bodies, and several speakers echoed his remarks in their application to Messrs. Forder and Company. There is no doubt that those coachbuilders who give the subject close attention and take the matter up seriously will reap a good reward in the end.

ON THE RIPLEY ROAD. A HALT AT COBHAM.
[Mr. W. C. S. Suther.]

Scottish Meets.

THE eastern section of the Scottish Automobile Club held its second run of the season on Saturday. The cars assembled in St. Andrew Square, Edinburgh, creating the usual interest among the passers-by. The programme was to proceed to West Linton, where the members lunched together at the Gordon Arms Hotel, and thereafter the run was extended to Biggar or Peebles as individual members desired. One of the features of the run was the appearance of Dr. Dawson Turner's new car, a 6-h.p. Delahaye tonneau. Among the other members taking part in the run were:—Mr. John Wilson, on his Decauville; Mr. James W. Hunter, on his Daimler; Mr. John Macdonald, on his 7-h.p. Daimler double phaeton; and Mr. J. H. Irons, on a Daimler victoria. Mr. James Ballantine, on his Daimler; and Mr. Ralph Moore, on his 6-h.p. Daimler double phaeton were expected to join the run at East Howgate. The Rossleigh Cycle and Motor Company, Limited, had out their Canstatt waggnette and Daimler dog-cart for the benefit of non-car-owning members of the Club. The western section of the Club had a run from Glasgow, their destination being Lanark. Ten cars, carrying over thirty

passengers, took part. The roads were in first-class condition, and the run through the Clyde valley was very much enjoyed. The now well-known Kirkfieldbank Hill was safely negotiated by all the cars. After tea at the Clydesdale Hotel the party returned homewards. The following took part:—Messrs. Henry Napier's De Dion, Rankin's Albion, Prosser's Wolseley, Kingsbury's Panhard, Worton's Argyll, Lamont's Albion, Morton's De Dion, Govan's Argyll, Fox's Gladiator, and Burns's Daimler.

The First Exhibition in England.

THE success of the Motor-Car Exhibitions at the Agricultural Hall being now so well assured, it is interesting to recall that the first public exhibition of automobiles in this country was held in October, 1895, at Tunbridge Wells. Sir David Salomons, who was Mayor of that town at the time, organised the exhibition to attract public attention to the new movement, and also to assist the Bill which was then in Parliament for removing the "man with the red flag." There was a large attendance of legislators, journalists, and others at the display (as a reference to the illustration on another page will show), with the result that their sympathies were evoked, and in the following year the Bill passed through Parliament. In 1896 a collection of motor-vehicles was an attraction at the Imperial Institute, and in that year Mr. Cordingley organised at the Agricultural Hall the first purely trade exhibition. The recent show demonstrated the success that has been achieved in this line, and all goes well for its repetition at next year's exhibition.

The Exhibition Question.

A MEETING of the General Committee of the Automobile Mutual Protection Association, Limited, was held at the registered offices, Jessel Chambers, 88, Chancery Lane, London, on Friday, the 2nd inst., and amongst those present were the President (the Earl of Shrewsbury and Talbot), Mr. J. J. Mann, Mr. E. Shrapnell Smith, Mr. A. E. Hodgson, Mr. C. Friswell, Mr. R. Moffat Ford, Mr. T. W. Staplee Firth, and Mr. G. R. Helmore (treasurer and secretary). A large amount of important business was dealt with, and the following resolution was carried unanimously:—"That in the opinion of the Committee of this Association the course adopted by the Automobile Club in allowing the trade to be led into a contradiction of their resolution of June 11th, 1901, has brought about the multiplicity of exhibitions, and that had the Club refused to encourage a disturbance of the arrangement which has been loyally adhered to by the Automobile Mutual Protection Association, Limited, exhibitions other than the Automobile Club's Agricultural Hall Exhibition would have been extinguished before the question could have been re-opened legitimately."

The Manchester Automobile Club.

THE first run of the season of this club took place on Saturday last to Tarporley, a well-known Cheshire village situated within about ten miles from the city of Chester. It was anticipated that at least twenty cars would participate in the run, but, no doubt owing to the roughness and uncertainty of the weather, only eleven put in an appearance. Promptly at four o'clock, the time named, Mr. Fred Smith with his Daimler, and Mr. J. Whittaker driving a 10 h.p. Wolseley, arrived "neck and neck" at Budworth to visit Oulton Park. Fortunately at this period the weather was fine, and the drive down the winding shady walks of the Park to the Hall was very much enjoyed. A number of members were then conducted, by the kindness of Sir Philip Egerton, through the Park and the gardens and greenhouses, and afterwards they visited the beautiful old mansion. The journey was then continued to the "Swan" Inn at Tarporley, where tea was taken. Immediately afterwards the cars proceeded to Portal Lodge, the residence of Mr. Marshall

J. Brooks. The members were met by Mr. Brooks, and the pleasure of the visit was greatly enhanced by the genial welcome extended by him, and by his personally conducting them round the grounds, and calling their attention to all the various points of interest. Soon after seven o'clock the cars dispersed, some members returning home, while the remainder ran on to Chester with the intention of staying over the week-end. It was hoped that an invitation would have been received from the Earl of Haddington to visit Arderne Hall, but the Club were not fortunate enough to obtain this. By a curious coincidence, while Mr. W. E. Rowcliffe, the Chairman of the Committee, was delayed by reason of the ignition on his car having become defective, a gentleman kindly offered to send him assistance, which Mr. Rowcliffe, however, found himself able to dispense with, seeing that there was nothing seriously wrong. Subsequently, in the course of the conversation which ensued, it appeared that the gentleman in question was none other than Lord Haddington himself, who at once invited the Club to visit the Hall and grounds. Unfortunately it was then too late in the afternoon, owing to the delay caused by the inclemency of the elements, for the Club to take advantage of the invitation extended to them. Lord Haddington expressed a hope that the Club would on some future occasion pay him a visit, when they would receive a hearty reception.

Motor-Vehicle v. Tramcar.

MESSRS. BASS, RATCLIFF, AND GRETTON brought an action to recover £21 13s. 6d. from the Newcastle-on-Tyne Corporation for damages caused to plaintiffs' steam motor-vehicle through a collision with a tramcar. The motor-wagon was returning one evening from Gosforth, and when it reached a point on the road about fifty yards north of the road leading to St. Andrew's Cemetery, the vehicle was stopped to get up steam. After stopping perhaps a couple of minutes for this purpose, the driver suddenly heard a whistle from behind, and almost before he had time to turn his head, a collision occurred with a tramcar. The result was that the motor-wagon, which was laden with empty barrels, was damaged in the rear, all the barrels were thrown on the road, and a general blockage on the highway took place. The claim was for repairs, and the loss incurred through the motor being seven days in the repairing shop. The witnesses for the plaintiffs included a cyclist, who declared the car was travelling at the rate of twenty miles, but the driver of the car declared that he was only proceeding at the rate of six or seven miles an hour. For the Corporation it was submitted that the plaintiffs had been negligent themselves, first of all, in obstructing the road when they might have gone to the side, and, secondly, by not showing a light, although there were five men on the wagon who could have kept a look-out. His Honour said he did not see why the brewery-wagon should not have been moved to the side of the road, where it would have been out of the way of the tramcars, which were continually passing. Tramcars and those who ran them had no greater liberty in respect to the road than any other person driving or riding on the road; at the same time they were under no greater liability, and it must be borne in mind that tramcars had not the power of moving to the right or to the left to avoid a collision. Here, in the dark, the plaintiffs' driver sat down on the tram-line, knowing that the cars would be coming along sooner or later. Having sat down, he took no steps to indicate to the drivers of the cars where the vehicle was standing. Judgment was therefore given for the Corporation.

COPIES of *The Motor-Car Journal*, containing the first instalments of our report of the Motor-Car Exhibition, having been sent to His Royal Highness the Prince of Wales, we have received an acknowledgment from the Equerry-in-Waiting, who "is desired by the Prince of Wales to thank Messrs. Cordingley and Co. for the copies of *The Motor-Car Journal*."

A MOTOR-CAR club has just been formed at Barcelona with the title *El Automovil Club de Espana*.

CONTINENTAL NOTES.

BY AUTOMAN.

IN a recent issue I gave M. Leon Serpollet's figures by which he estimates the maximum effort of his 20-h.p. racing-car during the 29½ seconds in which he accomplished the record kilometre on the cemented path of the Promenade des Anglais, at Nice. M. J. Ravel, an engineer of some distinction, in enlarging on these data in *La France Automobile*, gives some astonishing figures, which bring clearly before the mind the great difficulty of obtaining speeds much in excess of those already attained. It is well known that the resistance of the air increases as the square of the speed.

TAKING M. Serpollet's figures as a basis, that is to say, four cylinders (single-acting) 75 mm. in diameter by 90 mm. stroke and 1,220 revolutions per minute, with a steam pressure of 53 atmospheres or 795 lbs. to the square inch, the horse-power

offers the least resistance to the air. M. Ravel, notwithstanding the figures in favour of steam in its lead over petrol, affirms that he is *mathematically certain* that petrol will yet catch up, and even surpass steam in this direction.

I HAVE not yet seen any notice taken of this subject of air currents. It will be patent to everyone that in record-making, where the resistance of the air becomes such an important factor, to have trustworthy results it will be necessary in future to bring into the calculation the speed and direction of the wind during the contest. The difference in air resistance between a head and stern wind will make a difference of miles per hour in the results, and the competitor in a record contest who happens to get into a favourable lull in a head wind or a favourable puff in a stern wind will have a considerable advantage over the rest. The only true test will lie in an instrument, a kind of anemometer, carried by each car, which will register the speed with due reference to the air currents.

THE FRENCH HEAVY-VEHICLE COMPETITION—THE MILITARY COMMISSION, ON SERPOLLET CAR, WHICH ACCOMPANIED THE COMPETING VEHICLES.

developed by the engine would be 106 at the speed attained, namely 121 kilometres (75 miles) per hour; the resistance of the air takes up four times the power required for the traction. The power may, therefore, be divided as follows:—Overcoming mechanical friction, 26-h.p.; overcoming resistance of the air, 64-h.p.; overcoming tractional resistance, 16-h.p.; total, 106-h.p. Applying the same calculations to the Mercedes, on which M. Degrais accomplished the speed of 100·580 kilometres (about 62 miles), the results give:—Overcoming mechanical friction, 9-h.p.; overcoming resistance of the air, 30 h.p.; overcoming tractional resistance, 8-h.p.; total, 47-h.p. Thus, in order to increase the speed by 13 miles per hour, the horse-power has been more than doubled.

REMEMBERING, however, the axiom that the air resistance increases as the square of the speed, it becomes evident that to beat M. Serpollet's record by ever so little will require an enormous increase of power, and the only factor worth studying in the design of a racing machine resolves itself into the one which

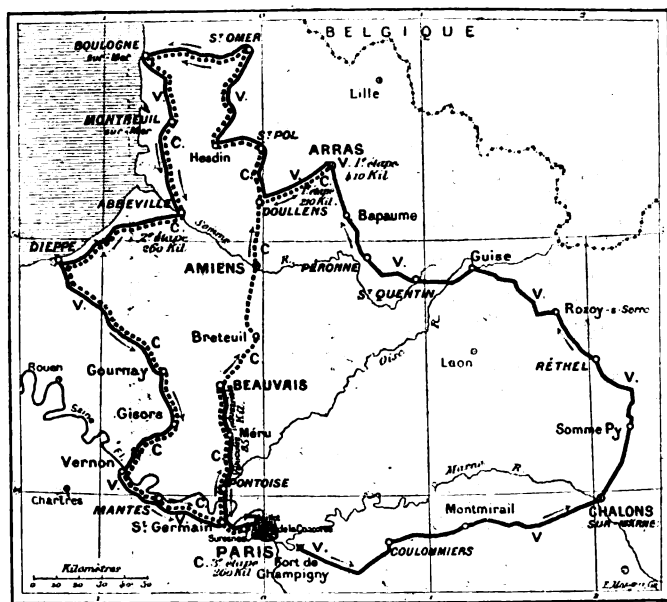

ONE cannot help regretting that the 50-h.p. Napier, did not figure in these interesting trials at Nice, so that an official record could have been obtained of its maximum speed; for, whatever may be the merits or demerits of the records already made by it, they are certainly never taken into consideration on the Continent. Bexhill will, it is to be hoped, fill the *lacune*.

THE new racing Mors cars are out. An improvement in the transmission mechanism consists in a direct drive on the fourth speed, without any intermediate pinions between the motor and the differential. The idea, no doubt, originates with the well-known and now almost generally adopted principle applied to motor-cars on the universal-joint system, which have for some time had direct drives on the top speed. To apply this principle to chain-driven cars is what Mors has set himself to work to accomplish, and he has done it in a very ingenious way. In the gear-box there are the usual two parallel shafts, with the square movable sleeve carrying the different pinions for the first three speeds. For the sake of clearness I will call the shaft in a line

E

with the engine-shaft the driver, and the intermediary shaft between the driver shaft and the differential the driven. At the end of the driven shaft there is the usual bevel-pinion, which gears into and drives the differential shaft, and through this wheel the power is transmitted for the first three speeds. The fourth speed, however, is transmitted direct from the driver shaft to the differential by means of a spur-wheel, which is out of gear during the first three speeds. When the fourth speed is required the lever forcing back the driver shaft leaves the driven shaft out of gear, and brings the pinion at the end of the driver shaft into gear with the differential. The axles are hollow, with a tapering cavity. An arrangement for releasing compression by the starting handle, which is automatically thrown out of gear when the motor starts, is also a feature, while the counter-shaft brake is of the jaw pattern, and the sprocket-brakes admit of the removal of a wheel without dismounting them.

THE boom in motor-cars is greater in France than anywhere, notwithstanding the multiplicity of the makers and their extensive means of production. Some returns for the provinces show an ever-increasing demand. One Department alone shows an increase of 131 motor-cars since January 1st. Prices, too, are

THE FRENCH ALCOHOL COMPETITION—ROUTE MAP.

Black line indicates route for racers; dotted line that for touring cars, and the double line to Beauvais that for industrial vehicles.
La Locomotion.

going up. Decauville issued a new list a short time back, and now Georges Richard has increased the price of his light cars by about 15 per cent.

RECORD BREAKING still continues to be a favourite pastime for Continental automobilists, and on Saturday last, despite the bad weather, Messrs. W. K. Vanderbilt, jun., David Wolf Bishop, and Henri de Rothschild amused themselves on the Ablis-Chartes road in their automobiles. Messrs. Tampier and Gaudichard, the official timekeepers to the A.C.F., were in attendance. After several attempts Mr. Vanderbilt succeeded in lowering the record, and covered the kilometre in 32½ seconds, at a speed of 110 kilometres (68 miles) an hour. Mr. Vanderbilt now holds, therefore, the record for the kilometre with a flying start for petrol cars.

THE Parisians are to have another navigable balloon to enliven the season, and keep all the curious with their noses in the air. M. Severo has practically completed his air-ship, and is only waiting for fine weather to make his trial trip. On Sunday last his balloon was inflated and tested as a captive, and within the limits of its bonds it seemed to manoeuvre with the greatest ease. I described the new air-ship last year, and I need only mention that there are two motors and six propellers, or rather six fans

—two in front to prevent the air resistance being too great, two behind to propel the ship, and two at the sides to steer with.

READERS will remember that a few months ago, when Fournier sailed for America to take up the management of the Fournier Searchmont Automobile Company, I expressed a doubt as to whether he would remain on the other side of the "silver streak." My predictions have been soon verified, for Fournier will know America no more. He has been engaged by Rabourdin, the proprietor of the Paris Automobile Garage, to undertake the management of the business. As to the fate of the Fournier-Searchmont Automobile Company I have no particulars.

THE Association Générale d'Automobile is about to organise some important excursions, amongst which is a tour in the South of England. I hope that this journey will be carried out and well attended. It will be a good opportunity for the automobile world to give an ovation to their French brothers, and to repay somewhat the kind receptions which English motorists have so frequently received across the Channel.

How slowly the world moves, and how motor-cars are pushing it along and burning red tape by the mile, is exemplified by the fact that the A.C.F. is about to petition that certain Custom-houses in France shall not be closed from twelve to two for the dinner-time of the officials. Just imagine arriving at a frontier at two minutes past noon in a hurry to keep an appointment some few miles on the other side, and to be stuck up for two hours while the officials smoke their cigarettes and finish their coffee!

M. GASTON STIEGLER, a writer on the *Matin*, and M. de Cuverville, a retired naval officer, now editor of the magazine *Armée et Marine*, left Paris, on Friday last week, in a De Dietrich car, for St. Petersburg, to follow the fêtes which will be held there during M. Loubet's visit. Their route as far as Berlin will be the same as that of the tourists' cars during the Paris-Berlin race last year.

THE "Circuit du Nord à l'Alcool," or the French Ministerial motor-car race, will be held on the 15th and 16th inst., and, as already mentioned, the manufacturers who were not able to show the merits of their various machines on account of the refusal of the Italian Government at the last minute to sanction the race from Nice to Albazia, are looking to the Circuit du Nord for a test of their prowess. All the leading firms are sending cars, and there are already over one hundred entries, including motor-bicycles, tricycles, voiturettes, light cars, racing cars, and touring cars. Very complete arrangements have been made along the whole of the route, and all under the direction of the Minister of Agriculture, but with the advice and assistance of the A.C.F. The race ought to be a great success, and will cover about 1,000 kilometres in the North-west of France, passing by Boulogne and Dieppe. There are altogether eighty-three entries for the racing contest, including eight Panhards, nine Mors, eight Darracqs, six Decauvilles, four Renaults, eight Clements, four Gardner-Serpollets, and two Georges Richards. A Mercedes has been entered by Vanderbilt, and amongst the names of *chauffeurs* who are driving cars I notice those of Fournier, Antony, Jarrott, Rolls, Foxhall Keene, De Knyff, Maurice Farman, Pinson, Chauchard, Berteaux, Teste, Augier, and De Caters.

AUTOLITE, LTD., has been registered with a capital of £25,000, to acquire inventions relating to the generation of acetylene gas.

WE hear that some experiments are shortly to be made with a special form of spring road wheels which are being fitted to a 16-h.p. Napier.

AT Herne Bay, motorists can be supplied with petrol by Messrs. Root and Clarke, of Station Road, who have been appointed official repairers by the Automobile Club. They have a large garage, and also undertake repairs.

FROM END TO END.

THOSE who have not experienced the ride from Land's End to John o' Groat's can have little conception of the fatigues and troubles of the journey. It is no mere holiday picnic, but a serious undertaking that requires nerve, pluck, and a patient persistency that seems lost in this rushing age. The first intrepid travellers to do the run this year have lately returned to town. To be exact, they arrived at the Agricultural Hall, Islington, N., during the Exhibition, and within five minutes one of the party—Mr. Loxton Hunter by name—was being interrogated on behalf of the *Motor-Car Journal*.

The trip was undertaken on a M.M.C. car, the intention being to demonstrate the reliability of a new pneumatic tyre; and this, it must be noted, behaved admirably, as the condition, when exhibited in the Hall, on the last day of the show, clearly proved. As he dismounted Mr. Hunter appeared the personification of health and vigour.

"Yes," he replied to our inquiry, "I feel well—far better than when I started from London to Cornwall a few days ago. In fact, there is nothing better as a recuperator than a good motor-ing trip, and the continual changes of climate through which I have passed have certainly had a good effect on my health. In fact, as a journalist, who often feels jaded in London, I have determined to join the ranks of the motorists, being so convinced of the reviving effect of the sport."

"Now, Mr. Hunter, just tell us your impressions as to the reception accorded your car as you went through our English counties."

"Well, to tell the truth, we were regarded as ordinary common-place sort of travellers. Speaking generally, the villagers are well accustomed to automobiles nowadays, and it was only in Cornwall that I felt we were being regarded with suspicion. Many people journey to Land's End with the idea of making the journey to the Highlands. They sign the book and depart—never to be heard of at the other end. Hence the critical view of the local people as they see motorists going seaward, and talking boldly about the perils of the journey north. But still the motor-car is accepted as an institution of the road, and in Scotland it was regarded with absolute indifference. That was

MR. LOXTON HUNTER AT LAND'S END.

the most striking impression on my mind—the greater popularity of the automobile north of the Tweed than in England. In all the villages there appears to be two or three motor-cars; in fact, almost every local doctor has a car."

"What about the roads?"

"Not having been over the whole of the route previously, I cannot say whether improvement has been made, but I was surprised to find such excellent highways as far north as Caithness. Touring there was a pleasure indeed."

In the course of further conversation Mr. Hunter told of a difficulty experienced on one or two occasions in getting petrol,

particularly in one place some distance from Inverness. He there had to leave the car, and go to Inverness for a supply, but that was the only time inconvenience occurred. There had been no adventures of exciting moment, no terrible rushes down precipices or midnight prowling up hill. The trip had been a patient forward journey, in which the driver—R. Bunkall—had shown himself a man of resource and a motorist of experience. Such was the testimony of Mr. Hunter, whose successful trip, though satisfactory to the automobilist, was singularly lacking in incident so loved of the interviewers. Besides being the hero of the latest end-to-end trip, and the first this year to sign the book at John o' Groat's he is writing a book on his journey, and we are somewhat afraid his reticence as to exciting experiences may have been due to a natural desire not to forestall public interest in that work.

THE MEZGER SPARKING PLUG.

MR. C. A. MEZGER, of the Regent Automobile and Machine Company, Clinton Street, Brooklyn, U.S.A., has recently devised a new sparking plug, of which a sectional illustration is given herewith. It is claimed that the

plug is so designed that soot will not interfere with the spark. A is the rod terminal which holds all the parts in place and is surrounded by the porcelain sleeve C, having a large core through which the electrode passes. The designer lays particular stress on the concentric space surrounding the electrode, which, he claims, would have to be choked up with carbon before a short circuit could be effected. E is a sort of cap made of porcelain. Together with the nut F and a washer it prevents the escape of gases from the cylinder of the motor. The wire connection is made by slipping a wire between F and G and tightening the latter, which is a knurled nut. To the metal plug D all the parts are secured, while the plug itself is screwed into the cylinder. All joints are packed with asbestos washers. The electrode B is driven into D in the usual way. The manufacturers have adopted a special metal for this terminal, which, they state, is cheaper and more satisfactory than platinum, and is not liable to break when being set, i.e., when bent. In the course of a test of one of the new plugs, it was held up to a gas jet and completely covered with soot. It was then attached to a motor, which was readily started and run for some length of time. The ignition was perfect when running with either full or with partly relieved compression, and no additional accumulation of carbon could be found after removal.

THE McCURD PORTABLE MOTOR-BICYCLE SUPPORT.

MR. W. A. McCURD, who is devoting considerable attention to stands for motor-cycles, has just introduced a new portable support for use on motor-bicycles. Fig. 2 shows the device diagrammatically, while Fig. 1 shows its position

FIG. 1.—POSITION OF SUPPORT WHEN NOT IN USE.

on the machine when not in use. It consists of a clip and segment *A* bolted permanently to the chain stays of the machine by the back plate *K*. The leg *F* is constructed to rotate on the pin *C*.

FIG. 2.

- | | |
|--|--|
| A Clip and Segment. | F Tubular Leg. |
| B Split Pin securing Lock Nut. | G Spring arranged to absorb Chain. |
| C Pin upon which the Leg <i>F</i> rotates. | H Spring governing Finger <i>D</i> . |
| D Spring Finger. | I Chain. |
| E Cross Piece to withdraw Spring Finger. | J Chain Stays of Bicycle. |
| | K Back Plate securing the Clip <i>A</i> to Stays of Bicycle. |

and is arranged to lock itself in two positions by the spring finger *D* dropping into two holes drilled in the segment. *B* is simply

a split pin securing nut on the pin *C*, and *E* is a crosspiece by which the spring finger is withdrawn from the holes. To prevent the legs "spreading" a chain *I* is used (passing through a hole in each leg), the extension of which is governed by the stop *L*, which will not pass through the hole, and when the legs are closed the spring *G* immediately contracts and draws up the chain. When the jack is required it is only necessary to withdraw the stops and press the legs to the ground, when, by placing the feet behind the tubular legs and pulling the machine back, the machine is jacked up in much less time than it takes to write it. The width of the base is 16 in., so that there is no fear of the machine falling, while any longitudinal movement is impossible without shearing off the pin *D*, which is made of 5-16 in. steel. The position of the legs is governed by the segment being inclined from the vertical, while the stud *C* is, of course, at right angles to the face of the segment. The device is amply strong enough to allow the rider to sit on the machine and start the engine, while for tyre repairs, ordinary engine repairs or replacements, and the convenience of being able at any moment to jack the machine up and prevent the risk of a fall and consequent damage, it forms a useful accessory.

MILITARY AUTOMOBILES.

CAPTAIN P. S. WALKER, of the Royal Engineers, has, according to information we have received, been writing to the American Automobile Club, saying it was his idea to ask the Commander-in-Chief to approve of a more general use of motor-cars and bicycles in the present campaign, and he desired to be ready with the necessary specifications and prices. He believed American road conditions more closely resembled South African than those of England, and he accordingly enclosed a copy of a letter he had sent to a dozen or more American makers. The letter was as follows:—

"I may be requiring several automobiles, light motors, and motor-bicycles for work in the field, and should be obliged if you could quote me c.i.f. Cape Town or Southampton, stating also what stock you hold, and how soon you can manufacture and deliver from stock. As far as experiments go the following are my probable requirements:—

"Automobiles, steam, 6 to 7-h.p., and 8-h.p.; petrol, 8 to 10-h.p. and 12 to 15-h.p., water-cooled, to carry two and four men; on trailer, 450 to 700 lbs.; wire wheels, pneumatic tyres very stout, geared for a maximum speed of 15 to 20 miles per hour, lightness essential, seat accommodation as simple as possible.

"Motors: steam or petrol, of same type as used in cars for fixing on a horse-drawn vehicle, capable of going over very rough country, with carburettors, tank, etc., complete. Also water-cooled gasoline motors from 2 to 5-h.p., with all accessories, capable of being carried singly or in pairs on pack-saddles.

"Motor-bicycles: for rough work, low-g geared; the motor should be protected as far as possible from dirt and high up for crossing rivers. I should require sketches or drawings and descriptions, to enable me to judge of their utility for work out here. The gear will be primarily used for running search-lights in the field, but it might be put to other uses, so that it will be given a thorough military test.

"In case I should be proceeding to England to buy plant you might send a second copy or reference to agent in England, care Messrs. Cox and Co., Charing Cross, London."

Of course it may be that American roads, which are universally acknowledged to be far behind those of this country and the Continent, approximate more closely to the conditions of travel in South Africa, but we regard it as a pity that such a letter, giving the views of an expert as to what is wanted in warfare, should escape the notice of the British automobile industry. Hence we have pleasure in giving it the extended publicity of our columns and would express the hope that when British military men forming conclusions as to the requirements of the times they should first make them known in their own country.

THE Motor-Car Exhibition at the Agricultural Hall.

THIRD NOTICE.

THE FIRST EXHIBITION OF MOTOR CARS IN ENGLAND—TUNBRIDGE WELLS, 1895.

From photo lent 1/11

(Sir David Salomons, Bart.)

THE Maudslay Motor Company, who are establishing large works at Coventry, exhibited one of the first vehicles they have turned out. The car, the body of which took the form of an eight-seated station omnibus, convertible into an open brake, comprises a number of interesting features. First of all we may refer to the frame, which is built up of rectangular steel tubing filled with ash. In the fore part of the frame is set a three-cylinder vertical engine of 20-h.p., the cylinders being 5 in. diameter by 5 in. stroke, and the normal speed 800 revolutions per minute. The ordinary electrical ignition is employed, the contact breaker being on the dashboard. Provision is also made for the fitting of tube ignition as a stand-by. The exhaust valves are located on the top of the explosion chamber and are actuated by a shaft which runs across the top of the engine, the shaft being driven by worm gear and a vertical shaft off the main shaft. A centrifugal type of governor is provided; it is mounted on the vertical shaft which actuates the exhaust-valve shaft. It operates directly on a rocking spindle in the induction pipe, which has a disc throttle valve at its extremity. This spindle is mounted on ball bearings, thus rendering the governor extremely sensitive. The cylinders are provided with large water-jackets, while the sides of the crank case are provided with detachable plates to allow of ready access to the cranks and piston rods. The exhaust valves exhaust into a drum at the side of the cylinders. The drum, from which a large pipe extends to the silencer, is provided with a relieve valve, so that in case of a back fire in the cylinders all undue pressure in the silencer is relieved. The cranks are set at an angle of 120 degrees to each other, giving equal division of explosion as well as best possible balance. Forced lubrication obtains throughout. The engine shaft is extended forward, and by means of worm gear drives two barrel force pumps carried on brackets from the frame. The oil, after being flushed through the bearings, returns to the reservoir through a filter. An indicator in the main supply pipe is mounted on the dashboard and serves as a tell-tale. The clutch shaft is provided with special universal joints. Four speeds and a reverse motion, controlled by a single lever, are provided. The change gear is an improved form of the Panhard, the four gears being arranged in two pairs, and moved to and fro by means of a cam plate. From

the differential shaft the power is conveyed to the rear road wheels through the usual duplicate pair of chains and chain wheels. The manner in which the sprocket wheels are carried on the face of the road driving wheels is also noteworthy. The nave of the wheel is produced inwards, and is provided with two sets of six arms, the inner set being bolted to the sprocket ring and the outer to the driving road wheel through the enlargements of the spokes in the usual way. This arrangement allows of the fitting of an oil-bath gear case. A foot pedal actuates a band brake on the differential, while the hubs of the rear wheels are provided with hand-operated hand brakes. All the brakes are double-acting and water cooled, and the first action of applying them is to disengage the clutch. The road wheels are of the artillery type, the rear ones being 42 in. diameter and shod with solid tyres; the front wheels, which have pneumatics, being 36 in. in diameter. The car has a wheel base of 8 ft. 3 in., and weighs about 18 cwt.

Marine engines of 1½, 3, 5, and 7½-h.p. were shown by Messrs. F. R. Leith and Company, who also exhibited a 1½-h.p. engine fitted with reversing propeller. These are of the Lozier type, and in the higher-powered types a special magneto-ignition is used. In this the friction wheel is mounted on a flexible shaft, and although a spring holds the friction wheel firmly against the fly-wheel, the flexibility of the shaft prevents that rigidity which might produce over-heated bearings. The employment of the flexible shaft enables the Lozier gas-engine magneto to be screwed to the floor of any launch, and operated directly by the fly-wheel of any engine. A simple method for keeping the commutator free from grit, oil, or dirt has been provided without the necessity of using emery or sand paper. The friction-wheel is mounted on a ball bearing rocking arm, ensuring perfect freedom of motion.

Messrs. W. J. Bishop and Company made a prominent feature of their accumulators, in which the plates are separated by corrugated celluloid sheets. Should buckling take place contact between the plates is impossible, a point of advantage which is obvious. These are made in celluloid, ebonite, or teak cases. Connecting plugs, inspection lamps, induction coils, volt and ampere meters, etc., completed an interesting display.

H

The Creek Street Engineering Company have now entered the lists of builders of heavy steam vehicles, and had on view a low-built steam wagon intended to carry a load of one ton. The frame is constructed of wood and is mounted on dropped axles, the floor being only 14 to 16 in. off the ground. On the left hand side, at the front end, is mounted a flash boiler of a coil type, the series of coils being linked up to outside connectors. The water is fed to the boiler at the top, and the steam drawn from the bottom, so that a high degree of superheat is obtained. Paraffin is used

FIG. 78.—SECTION OF CREEK COMPANY'S AUTOMATIC REGULATOR.

as fuel, a section of the burner being shown in Fig. 79. The burner, which is of circular construction, is of the vapourising type, and is composed of a flame baffle B, which forms part of the vapouriser, and of a movable inducing tube F, with an expanded top which forms the burner. A needle passes down the centre of the inducing tube and enters the nipple from which the vapourised oil issues under pressure—this needle is attached to and moves with the inducing tube. The oil, under a pressure of about 20 lbs. per sq. in., first passes round the baffle into the steel coil C, where it is fully vapourised, then down to the nipple E, and thence as vapour up the inducing tube. The vapour in passing up the latter mixes with air, which mixture passes into the expanded top, from which it issues through a series of holes G, formed in its circumference. When at its lowest position the whole of these holes are opposite the baffle, which, deflecting the flame, concentrates it upon the coil, the flame being of just sufficient strength to keep the vapourising coil and baffle hot. When more flame is required the inducing tube is raised by means of a lever H, simultaneously the needle rises out of the nipple allowing more vapour to pass up into the burner, also a number of holes in the burner are raised above the level of the baffle, thus allowing the flame to spread. This action may be continued until the needle is raised completely out of the nipple, and all the holes are above the level of the baffle; in this way the greatest dispersion of the flame and the maximum heat are simultaneously obtained. One of the interesting details of the boiler is the combined auto-

matic control of the water supply to the generator and the fuel to the burner. The regulator (Fig. 78) which is applicable to all ordinary or flash boilers, is a simple proportional meter which proportions the fire to the amount of water passing in from the feed pump. It consists of an air vessel, B; cylinder, C; piston, F; and piston rod (tapered at the bottom to vary the area of the orifice through which the feed-water has to pass, in accordance with the position of the piston); an overflow valve, K, to release the surplus water when the set pressure has been attained; a ball-valve to prevent the boiler pressure acting back on the top of the piston; an adjustable fulcrum to vary the amount of burner movement in relation to the piston movement; and a safety valve in communication with the boiler, which is loaded from the same spring as the overflow valve. In action 200 lbs. pressure per sq. in. is raised in the air-vessel by a pump, and this pressure acting on the top of the piston pushes it down, and the tapered rod, opening the orifice, admits water to the boiler, and simultaneously raises the flame of the burner. The steam pressure now rising in the boiler to a point overcoming the air-vessel pressure (which is the pressure of the overflow valve) acts back against the bottom of the piston and forces it up, thus closing the orifice and so stopping the flow of the water to the boiler, and also shutting down the burner flame. The surplus water passes through the overflow valve. Once the adjustable fulcrum has been set for the required water-level in an ordinary boiler or required steam temperature in a flash boiler the action is entirely automatic. The proportions between water and fuel can be varied by adjusting a milled hand wheel, so that more or less rapid generation of steam can be obtained on occasion. A three-cylinder vertical reversing engine, with cam-operated lift valves, is placed beneath the driver's seat on the right-hand side of the wagon. By sliding the camshaft the cut-off can be varied. The transmission from the engine is by a roller chain to the differential countershaft, and thence by outside chains to the rear road wheels. The engine is 7-h.p. normal, but a much greater power can be developed on occasion. The engine drives a pair of force pumps, the one of which feeds water through the automatic regulator to the boiler, and the other forces the paraffin to the burner. The road wheels are of the artillery type shod with solid rubber tyres. Steering is controlled by a lever, while a pedal controls band brakes on the hubs of the rear wheels. The vehicle complete weighs about 14 cwt. The Creek Street Company also had on view samples of the burner and regulator, which they are putting on the market separately. At the opposite end of the stand was shown a Capel four-seated car fitted with 4½

FIG. 79.—SECTION OF CREEK COMPANY'S PARAFFIN BURNER.

b.h.p. horizontal two-cylinder engine. This vehicle was described at length in our report of the 1901 Exhibition. In the interval certain detail improvements have been introduced, but, generally speaking, the arrangement remains the same. The chains now used for the speed gear are similar to ordinary cycle chains, but are leather-covered. The steering gear is operated by a lever and is irreversible. Two new features in connection with the car are a governor device for regulating the speed, which consists simply of a spring-controlled valve placed in the inlet passage and which automatically closes when the speed of the engine increases abnormally, and the other being the new Johnston carburettor, illustrated and described in a recent issue.

Messrs. Mann and Overtons, Limited, who have lately acquired the British agency of the Georges-Richard motor-cars, had an imposing array of these well-known vehicles, including a *chassis*, a complete *tonneau* (Fig. 80) a double phaeton, and a car with a special *limousine* body. The frame is of tubular con-

acts on the admission, the normal speed of the engine being 1,300 revolutions per minute. A hand accelerator on the steering-pillar, and a foot lever in front of the driver, both operate springs which act against the governor, and allow the speed of the motor to be increased or decreased. The water circulation is maintained

FIG. 80.—THE GEORGES RICHARD 10-H.P. TONNEAU.

struction and is practically double, the lower part carrying the engine and transmission gear, the upper part taking the body. The power is supplied by a vertical two-cylinder engine, developing 10-b.h.p., the cylinders being 110 mm. diameter by 110 mm. stroke. The carburettor is of the Richard firm's own spray

by pump and radiators, the pump being cast in one with the crank casing. As will be seen from the plan of the *chassis* (Fig. 81) the power is transmitted through a pedal operated friction clutch to the change-gear box. A special pivoted-arm carrier connected with the clutch prevents any end thrust from

FIG. 81.—PLAN OF GEORGES RICHARD 10-H.P. CAR.

type, and a special form of electrical ignition is employed. The exhaust-valve cam shaft is enclosed. The contact maker and breaker, as also the pump, are driven by the same spur-wheel which drives the cam-shaft. Two ignition coils are used, one for each cylinder, they being fitted with tremblers. The governor

being put on the change-gear shafts. The gear-box gives a reverse motion and three speeds forward, equal to 10, 20, and 30 miles per hour respectively, any intermediate speeds being obtained by varying the speed of the engine. The drive is taken from the gear-box to the differential on the back axle, through a cardan

joint and a pair of bevel wheels. The forward speeds are operated by a single lever, a separate lever being provided to control the reverse motion. The change-gear lever is mounted on the steering pillar, and it may be mentioned that on the high speed the drive is straight through the transmission to the longitudinal universally-jointed shaft, none of the gear wheels being in action. A pedal controls a double-acting band-brake on the differential drum, while there are also band-brakes on drums connected with the hubs of each of the rear road-wheels controlled by a hand-lever. The road-wheels are of the artillery type, equal size, and shod with 750 mm. by 85 mm. Clipper-Michelin pneumatic tyres. A system of forced lubrication of the various parts is adopted, a branch from the exhaust pipe being employed to give the necessary pressure. Inclined wheel-steering is, of course, adopted, the complete car weighing about 10 cwt. The vehicles appear to be well-constructed, and we are looking forward to a trial run on one of them with interest. Messrs. Mann and Overtons also exhibited an example "Energie" tonneau. It is fitted with 8½-h.p. water-cooled two cylinder Buchet motor. The engine is regulated by means of a switch on the steering-wheel, which advances or retards the ignition. The carburettor is of the Longuemare spray type. A centrifugal water-circulating pump is geared direct to the engine-shaft, and a large radiator is fitted to the front of the engine. A special gear box is fitted close up to the clutch, containing three speeds forward and a reverse. All the speeds are changed by means of one lever conveniently placed on the right hand of the driver, the engine driving the universal shaft direct on the high-gear. Two brakes are fitted, both holding either backwards or forwards, the foot-brake acting on the transmission-shaft, and the hand-brake on drums fitted to the hubs of the rear-wheels.

A large and interesting display was made by the Simms Manufacturing Company, Limited, on whose stand were photos of the war car, described in our columns of the 12th April. A special feature consisted of a chassis for an Argyll car, fitted

FIG. 82.—THE SIMMS SINGLE-CYLINDER MOTOR.

with a 6-h.p. Simms water-cooled motor with Simms-Bosch magneto-electric ignition and timing gear, and with inlet valve regulator. Perhaps one of the most interesting of the Simms exhibits was the 8 to 10-h.p. twin-cylinder water-cooled motor fitted with the well-known Simms-Bosch magneto-electric ignition. The cylinders are 95 mm. bore by 110 mm. stroke. A specially arranged timing gear is also provided.

The cranks are set opposite each other. The governor is mounted on a separate shaft, and is driven by a fibre wheel gearing into a phosphor bronze wheel on the cam shaft. The governor regulates a throttle valve in the inlet pipe, and there is a special exhaust fitting supplying warm air to the carburettor. Ignition is varied by rocking the connecting rods which transmit the motion of the ignition cams to the igniter about the half-speed shaft, so that they are actuated by the cam earlier or later in the stroke. The automatic splash lubrication conveys lubricant to all the bearings, and a special point is the position of the fly-wheel, this being on the engine-shaft, outside the base chamber. Both the cylinders are cast in one piece. Air-cooled motors of 2-b.h.p. with spray carburettors and exhaust valve lifters, 3½-b.h.p. Simms water-cooled motor, with cylinder of 80 mm. bore by 78 mm. stroke, 6-b.h.p. motor, and a twin cylinder 12 to 15 b.h.p. Simms motor, formed part of a display which was completed by a large selection of accessories.

The stand of the Clarkson and Capel Steam Car Syndicate, Limited, was of interest to all users of steam cars. First we may mention the paraffin burner, not only for use on motor vehicles, but for industrial purposes. This burner is of the true Bunsen type, and the quantity of air allowed to mix with the oil-vapour before combustion takes place can be adjusted to a nicety. Another special feature in the burner is the absence of small holes. The paraffin, after being passed through a coil tube over the fire, issues by a needle valve into the induction tube of the burner, and then passes up through the annular burner orifice. A feature of the device is the combined control of the burner orifice and the vapour jet, by means of which complete combustion is obtained whether the fire is at full blast or turned down low. The initial heat to the vaporising tube can now be got without burning methylated spirits in the burner tray. A little paraffin is turned on into a cup, and from thence it drips on to an absorbent pad, and is lighted with a match. A small fan fixed in a convenient position is then rotated, and this blows the flame of the paraffin on to the vaporiser tube. Among other specialities displayed by the firm were the "Clarkson" radiators and condensers, high-speed water, oil and return feed pumps, steam separators, water filters, and an oil separator. The latter is fitted on the exhaust pipe, and separates the oil from the condensed water, the latter being returned to the tank. On this stand were also shown a couple of new American steam cars, known as the "Conrad." One was an ordinary two-seated runabout, and the other a four-seated *dos-a-dos*. In general outline these cars follow the usual lines; the run-about is fitted with a "Mason" 4½-h.p. double-acting engine, provided with extra cross-head water pump. The boiler consists of a steel shell 16 in. diameter, and contains a large number of copper tubes. The burner and generator is of the "Kelly" pilot type with automatic regulator. The water tank has a capacity of thirty-three gallons, and that for petrol seven gallons. The road wheels are 28 in. in diameter, and are shod with 3 in. pneumatic tyres. The *dos-a-dos* is a more powerful car, having an 18 in. boiler and a 6½-h.p. engine. The water tank holds 36 gallons, while eight gallons of petrol are carried.

One of the largest stands in the Exhibition was that of the Locomobile Company of America. Constant attention was attracted by one of the standard pattern two-seated cars, which was mounted on a stand with rollers under the four wheels, and shown in motion. As the regulations did not permit of the introduction of petrol into the hall, ordinary gas was led to the burner by a rubber tube and steam so generated, and the car kept moving at full speed on the rollers. Lieut. Walker's two-seated car, which has distinguished itself so greatly at the front, naturally caused many visitors to halt at the Locomobile stand. Considering the amount of work which the car did in South Africa it is in wonderfully good condition. The Locomobile steam cars are now known all over the world. The body contains the boiler, engine, fuel, and water tank. It rests on three springs, secured to an underframe of steel tubing. The water in the boiler is converted into steam by heat obtained by burning

ordinary petrol, the tank for which is carried under the foot-board. From the tank it is forced through the boiler, where it is vapourised) into the burner. Steam is generated in an upright copper boiler. Water is supplied to the boiler by a pump connected to the cross-head of the engine; the pump works the whole time the car is running, and is regulated by turning a by-pass lever. A steam gauge is placed in the front of the carriage, and a safety-valve is fitted, which blows off at 240 lbs. pressure. The engines are of the

FIG. 83.—THE LOCOMOBILE TOURING CAR.

two-cylinder double-acting type, running on ball bearings, and lubricated by a self-feeding oil cup. The water tank carries a supply sufficient for a run of between twenty-five to sixty miles, depending upon the condition of roads and style of car. In addition to the automatic pump an auxiliary hand pump is attached, which will fill the boiler in a very short time, even if the gauge shows 200 lb. pressure of steam. Attention may be drawn to the water lifter, steam air and water pumps, pilot light and automatic torch, with which all Locomobile cars can now be fitted. Among the new types was a victoria rumble specially finished throughout, and fitted with a 16 in. boiler. It has the new cylinder lubricator, the automatic steam pumps for air and water, recently described in the *Journal*, and a convenient little hand pump at the side of the driver's seat. Another new carriage was a Stanhope, fitted with a nicely shaped case, which forms a box front to the dash, containing two petrol tanks carrying sufficient fuel for one hundred miles. To obviate the necessity for running the petrol tank under air pressure an ingenious device has been adopted. Three small cylindrical vessels are connected together by pipes. The first contains petrol, the second water, and the third air. A few strokes of a small pump on the petrol tank forces more spirit into the petrol tank, which in its turn forces the water into the air cylinder, and consequently compresses it. A relief valve prevents the pressure exceeding 80 lbs. per sq. in. This air pressure behind the petrol provides a reserve of pressure for forcing the fuel to the burner for starting. As soon as the fire is started a start is made, the fuel is pumped by the engine to the burner, a diaphragm regulator preventing an excess of 80 lbs. pressure. The cylinder is fitted with a new lubricator to which is attached a small hand pump, one stroke of which with the finger every ten miles or so ensures efficient lubrication of the pistons and slide valves. Next we examined one of the new touring cars (Fig. 83). Every part of this has been made heavier and more substantial. The boiler is 16 in. in diameter, and the engine is a much heavier and larger type than has previously been used. The capacity of the water tank is said to be sufficient for a run of from forty to sixty miles, and that of the petrol tank for 100 to 150 miles. Quite a new model was the 8 to 10-h.p. wagonette, with seating accommodation for from six to eight persons. The frame of the car is of strong construction, the general arrangement of the engine, boiler, tanks, etc., following the lines adopted in the touring car. Both the boiler and burner are on the same principle as the other types, except that the former is 16 in. in

diameter, and the engine is a very heavy and larger type than hitherto used. It is estimated that one charge of water is sufficient for a run of from forty to sixty miles, and the capacity of the petrol tank is sufficient for a run of from 100 to 150 miles. On the stand was also shown a 21ft. Locomobile steam launch to seat twelve persons. The boiler is of the standard type, the engine is of a new form, comprising two vertical cylinders 2 in. diameter by 2 in. stroke; it is entirely enclosed, no valves being visible; steam is cut off at seven-eighths of the stroke. The water tank holds thirty-five gallons and the fuel tank eighteen gallons; a condenser is also fitted.

Another American light steam car, new to the English market, is the Foster, which was shown by the Blaxton Engineering Company, Ltd. The general features are similar to the well-known light steam car, but the whole construction is much heavier. The boiler is made of $\frac{3}{4}$ -inch steel shell, the shell itself and one head being pressed out of one piece, with 400 half inch copper tubes, the dimensions of the boiler being 16 in. by 14 in. The boiler is lagged with one inch of asbestos protected by a sheet-iron jacket. The engine has two cylinders, $2\frac{1}{2}$ in. by $3\frac{1}{2}$ in., and is fitted with link motion reversing gear. It develops 8-h.p. at 450 revolutions per minute with steam at 150 lbs. pressure. The steam can be admitted to the cylinders to cut off at a quarter of the stroke. The lower parts of the engine containing the shaft and connecting rod are enclosed and made oil-tight. With every down stroke, each connecting rod dips into the reservoir of oil and splashes some of the lubricant over the other bearings. Plain bearings are fitted, and a water pump of large capacity is driven direct. One of the special features of the car is that the burner is so arranged that normally one-half of it only is used, this being controlled, as usual, by a diaphragm valve. Another needle valve, in easy reach of the driver, enables the second portion of the burner to be brought into operation in order to obtain steam more rapidly when desired. The auxiliary burner is not controlled by the automatic valve. In connection with the burner is a pilot light which enables the driver to turn the main fire on and off at will from the seat. An automatic fuel regulator is provided which varies the fire in inverse ratio to the steam pressure, and usually checks the main burner when 160 lbs. of steam have been obtained. The lever operating the reverse gear is placed outside the driver's seat. The throttle valve lever is situated at the side of the driver in the body of the vehicle, and there is a special lever arranged in the centre of the car beneath the seat, this acting upon a rapid throttle valve enabling the driver to shut off steam close to the boiler when leaving the car at any time. A heavy chain transmits the power from the engine to the differential gear on the live rear axle. The dif-

FIG. 84.—THE FOSTER STEAM CAR.

ferential is of the enclosed spur wheel type. The drum of the differential is encircled by a double-acting band brake of liberal dimensions. The frame is of heavy seamless steel tubing with heavy yokes and knuckles. The rear axle is fitted with $1\frac{1}{2}$ in. shafts with accessible ball bearings. The petrol tank has a capacity of eight gallons and the water tank thirty-five gallons. Complete with water and petrol the car (Fig. 84) weighs 11 cwt. It is arranged to seat four persons, *vis-a-vis* fashion; it is fitted with wire wheels $28\frac{1}{2}$ in. diameter, the wheel base being 5 ft. 6 in.

On the stand of Messrs. Durkopp and Co. were displayed a chassis and a complete well-finished *tonneau* of the 10-h.p. Durkopp type of vehicle, and a 20-h.p. four-cylinder *tonneau* of the same make. To deal first with the 10-h.p. cars, these have a frame made of wood, reinforced by angle steel, mounted on artillery type wheels of equal size, taking 840mm. by 90mm. pneumatic tyres. They are fitted with a two-cylinder vertical engine, placed in the usual position under the bonnet. The governor, which acts on the throttle valve, is itself controlled by a pedal, which regulates the engine speed between 200 and 1,200 revolutions per minute. The two cylinders are cast in one piece, no water joint being used for the heads. The arrangement adopted for fixing the valves enables them to be withdrawn by removing a single nut. The crank chamber is made of aluminium, and is fitted with a drain cock, to let out any superfluous oil. Electric ignition is fitted, and this is timed by a small lever on the steering pillar. Tube ignition can also be provided as a stand-by. The carburettor is of the usual spray type. The water circulation is maintained by a pump driven by a gear-wheel off the half-speed shaft; a radiator is also fitted in the front of the motor bonnet. Three forward speeds and a reverse motion operated by a single lever

air-cooled motor with reversible blade propeller. *Special* curiosity, however, attached to the Texas steam car exhibited on the stand. This is claimed to be "self-adjusting for all roads, from a freshly ploughed field to glass-like asphalt," and is "the only motor-car designed in harmony with Nature's laws." The invention apparently consists of a kind of shield so constructed as to form part of the car. This projects to a point, the sides being formed so as to offer little air resistance. It also forms a water tank, thus adding to the capacity of the car. A window at the top and an arrangement similar to a cow-catcher beneath are also conspicuous features, the latter being said to prevent a rush of wind beneath the car and thus obviate back wind, which is responsible for the dust so often associated with the pleasures of motoring. As a novelty it attracted notice; we should, however, like to see it actually on the road before passing final judgment on the idea.

Clothing of good design for motorists was shown by Burberrys, who drew public attention to their "Five Way" Automoto Slip On, which is, in appearance, a sack coat provided with a skirt of ample width, the sleeves having an equally good margin. The idea has been to provide a coat which, while fully protecting the wearer,

FIG. 85.—THE DURKOPP 10 H.P. DOUBLE PHAETON.

are provided. The power is transmitted through a friction clutch to the gear-box and thence by bevel gearing to a differential cross-shaft, which latter is in turn connected with the rear road wheels by two chains. The clutch between the motor and the transmission is broader than is usual, and is so shaped that it does not grip suddenly when started. Double-acting brakes are fitted, there being two brake drums fitted on the countershaft close to the bearings on the frame in order to take the strain of the bevel gear. There are three pedals, the left one releasing the clutch, the right one releasing the clutch and applying two band-brakes on the differential shaft; the third small one is the accelerator pedal, which by pressing it down prevents the engine from cutting out. The hand brake on the side of the car releases the clutch and puts on two drum brakes on the hind wheels; these brakes are mounted on a swivel to prevent skidding. Complete, the 10-h.p. car weighs about 13 cwt. The 20-h.p. car is built on similar lines to the foregoing, the main difference being that it is fitted with a four-cylinder engine, and has four forward speeds; its weight is 17 cwt.

Messrs. Van Toll and Company showed 3½-h.p. and 6-h.p. single cylinder launch motors and a 12-h.p. two cylinder motor, all fitted with reversing gear; also a 2-h.p. single cylinder

also allows him full play for manipulating the mechanism of the car. In all the "five ways" in which the coat is made it is wind, dust, and rain proof; at the same time it is self-ventilating. The five differences are concerned with the temperatures for which each is fitted. That known as "airlyght" consists mainly of silk; for summer wear a stout cotton twill known as "Gabardine" is lined with camel fleece; the same material and lining, with an interlining of elk skin, is recommended for autumn. For winter a combination of Shetland frieze and camel fleece is employed, while a special coat, known as the "Blizzard," was also shown, this consisting of Shetland frieze and camel fleece interlined with elk skin—a combination that should enable the motorist to regard with equanimity any expedition in a northerly direction.

Induction coils, accumulators, and Léclanche cells were shown by Messrs. Gianoli and Lacoste, who also displayed amperemeters and voltmeters, sparking plugs, water-cooled heads for air-cooled motors, radiators, etc. The G.L. type of pump for the water circulation of voituresses was also given publicity, this being intended for an average speed of 400 to 600 revolutions per minute, an efficient circulation being thus obtained for cooling motors.

Public interest in the demonstrations given at the stand of the Liquid Air Power and Automobile Company, Limited, was well maintained throughout the Exhibition, but from the motorist's point of view some disappointment was probably felt by the announcement that the "liquid air automobiles" cannot be

FIG. 86.—SECTION OF THE LIQUID AIR CAR.

ready for delivery till next season. We give a sectional view (Fig. 86) of the car which was shown and which is claimed to be capable of running at any speed up to twenty miles an hour, the motive power being atmospheric air in the form of a liquid at a temperature of 312 degrees below zero. Referring to the illustration, A is the liquid air tank with a capacity of eighteen gallons, which is sufficient for a run of about thirty-five miles at ten miles an hour. B is the radiator, in which the liquid air evaporates and is heated to atmospheric temperature; a pressure of 200 lbs. being, it is claimed, generated in one minute by allowing a small quantity of liquid air to evaporate. Both the tank and radiator have safety valves, which blow off at 210 and 225 lbs. pressure respectively. The plug by which the tank is filled is shown by the figure 1; 2 is the throttle valve, which is operated from the seat by a lever on the right hand side of the car; 3 is the steering lever, and 4 the brake.

Messrs. Laurie and Marner's stand was occupied with a motor delivery-van and specimens of Pegamoid paints and enamels. A motor-bonnet covered with the Pegamoid silver paint presented the appearance of aluminium, and the fact that it is unaffected by heat or cold should help in adoption for the painting of automobiles. Cloths for upholstering purposes were also exhibited, and here again the application of Pegamoid to the motor-car should prove serviceable.

As the title of the firm implies, the exhibit of the Electric Carriage and Garage Company was devoted to a display of electric cars, all but one of which were on the Krieger system, in which the two electric motors are supported forward of the front axle, pinions on the shafts of the motors gearing into an internally toothed fibre ring placed on the axle at the side of the wheels (Fig. 87 and 88). First we examined a double phaeton in white and grey, which reminded us somewhat of the "Powerful," which figured at the 1901 Exhibition. The battery, which is arranged partly under the forward false bonnet and partly under the rear seats, consists of forty-two Fulmen accumulators of 200 ampere-hour capacity, sufficient to run the car a distance of from 50 to 60 miles over good roads on one charge at an average speed of 12 miles an hour. The controller is adapted to give five forward speeds, a reverse motion, and three positions of electrical braking and recuperation of the batteries for use on descending long hills. The car is fitted with equal-sized artillery wheels and pneumatic tyres, and weighs complete about 26 cwt. A luxuriously-uphol-

stered victoria for three or four passengers and coupe for the same number, both capable of running about 50 or 60 miles on a single charge, were also on view and are worthy of inspection. In both these vehicles forty-two Fulmen cells are made use of, and they are so disposed that their position can only be discovered by examination. The controller is arranged around the vertical steering column. The novelty on the stand, and indeed in the Exhibition, as regards electric cars, was the Northey landaulette. Although the carriage has not been completed, all its essential parts were in working order. The most striking departure from the usual design of electric motor-vehicles is the employment of a motor placed under a bonnet in front of the car, its shaft running longitudinally under the body and driving the rear axle by means of a worm-wheel and tangent-gearing of such a pitch that when the car is running downhill, the rear road-wheels will drive the motor instead of *vice versa*, and so enable it to recuperate the cells. The motor is of the four-pole type with laminated fields, and develops 4½-h.p. A distinct novelty, so far as electric cars are concerned, is the employment of a two-speed gear. This is attached to the motor-shaft, and is arranged to give ratios of one to seven and one to fourteen. The two-speed gear is, of course, chiefly valuable as a means for climbing hills, for the motor can be kept running at its normal

■ FIGS. 87 AND 88.—ELEVATION AND PLAN OF KRIEGER DRIVING ARRANGEMENT.

speed, while the car will only travel at half its usual pace. The speeds are altered by moving a small handle. The change-speed gearing is very compact, and is worked by a double magnetic clutch, which is operated by the main current running from the

batteries to the motor. The clutch is fitted with two collectors to convey the current to the winding. On the high speed there is no gearing down, the magnetic clutch connecting the motor-shaft direct to the worm-gear. The employment of magnetic clutches is especially appropriate on an electric car, and as the main current is taken through the clutch, the clutching effect is proportioned to the power being transmitted. A foot lever permits recuperation in all positions of the controller. The car is not yet fitted with the battery. This will be of a special type, Planté positive plates being used with zinc negatives, by which the durability of the Planté type of accumulator is claimed to be obtained with the same degree of lightness as in pasted types of cell. It will consist of thirty-two cells, having a capacity of 120 ampere-hours, sufficient for a run of 50 miles on level roads and in the hands of a good driver—for the mileage possible depends very largely on the latter factor. One half of the battery will be carried under the driver's seat, and the other in the body at the rear of the vehicle. By lifting a small slate plate the whole of the connections to the batteries are at once disconnected. The controller, which is carried on the top of and across the dashboard, gives four forward and reverse speeds, and these changes in combination with the magnetic clutch gear already mentioned give eight changes of speed as desired. The speeds are changed by the backward and forward movement of the steering-wheel standard, and the magnetic clutch is actuated by a small lever on the dash-board, conveniently located near the driver's right hand. Powerful electrical and mechanical brakes are fitted and the steering is a special feature, the hubs of the front wheels being made hollow and pivoted in the centre. On the highest speed the battery is connected up in series, and on the lowest in four parallel sets of eight cells. A band-brake on the high-speed shaft is actuated by a pedal, the depression of which first cuts off the current. Two band-brakes round the differential gear are applied by means of a side lever in the usual way. The road-wheels are shod with solid rubber tyres. As will be seen from the description, the new vehicle is a radical departure in electrical vehicle construction, and its advent on the road will be watched with interest.

Considerable interest was shown in the vehicles exhibited by the Motor Construction Company, who are building light steam-

however, burn petrol equally well. A special apparatus is provided for starting the burner from "all cold." No loose apparatus of any sort is required to start the burner, which is effected by placing a light to the hole in the burner provided for that purpose. The working steam pressure is 200 lbs. per square inch. The engine is a substantially-built machine, having two cylinders $2\frac{1}{2}$ in. in diameter by 3 in. stroke. It has the advantage of having the two cranks and big ends completely enclosed, thereby preventing any grit or dirt getting into them. We understand that future cars will be fitted with an engine $2\frac{1}{2}$ in. by 4 in., with aluminium frame, circular crosshead slides, and piston valves. The transmission is by a chain to a chain-wheel on the differential on the rear axle. The underframe is of tubular construction. The steering is controlled by a side lever, while the cycle-type road-wheels can be fitted with solid rubber or pneumatic tyres. The water-tank has a capacity sufficient for a run of thirty miles. Fig. 89 shows the "Vapomobile" 6-h.p. *dos-a-dos*. The boiler is 16 in. in diameter, and contains 360 fire tubes; it is located in the centre of the frame, the chimney outlet being at the side of the body. The water capacity is sufficient for a run of forty miles. A useful feature is the provision of a steam lock with detachable key, so that there is no fear of the car, when left, being started by any inquisitive admirer. A third car on the stand was a two-seater, having boiler, engine, and underframe similar to the *dos-a-dos*. A feed-water heater, automatic air-pump for the petrol tank, and an independent automatic feed-pump can be fitted. On the stand was also a 24 in. multitubular fire-tube boiler built by the company. It has 962 copper tubes, the total heating surface being 170 square feet. In this boiler a dry plate is fitted right across above the waterline. The plate is held in position by studs fixed in the crown of the boiler, and passing down between the tubes; the part above the plate forms a superheating chamber. It may be mentioned here that the shell of the boiler is no less than $\frac{1}{8}$ in. thick. To show the class of work turned out the company staged, side by side with this large boiler, is a new two-cylinder engine, having cylinders $3\frac{1}{2}$ in. by 5 in. stroke. The crank-chamber is made of aluminium, and the bearings, both of the crank-shaft and of the connecting rod big ends, are of the roller pattern. A Renold silent chain-wheel is mounted on the crank-shaft between the cylinders. One of the main features of the exhibit was a new condenser, which consists of a chamber about 2 feet long and of a cylindro-triangular section in which the exhaust steam is collected. From this chamber issue sixty-four small jets of about $\frac{1}{8}$ in. cross section, which end inside a similar number of nearly horizontal copper tubes. These are open round the ends of the jets, and point in the direction in which the car is travelling. They terminate in a second box corresponding with the first, and of approximately the same dimensions. The steam issuing from these jets into the larger tubes carries in a certain amount of air with it, the quantity being increased by the forward movement of the car. In this way the steam is subjected to a double cooling action—that due to the air which enters it, and that due to the cooling effect of the air on the outside of the copper tubes. The condenser is carried lengthwise under the car, with the open ends of the tubes forward, the rear tank being set lower than the exhaust-box. It is claimed for the arrangement that, for a given weight of metal, nearly double the cooling surface is obtained, and that back pressure on the engine is avoided. A suitable form of oil separator and filter is fitted in conjunction with the apparatus, so that the condensed water may be used again in the boiler, enabling a car which carries about 35 gallons of water to run 100 miles on one supply.

FIG. 89.—THE "VAPOMOBILE" DOS-A-DOS.

cars on the lines of the well-known and largely-used American type. We have often wondered why this has not been done before, and are therefore glad to be able to give some particulars of the English-built "Vapomobile" cars. The two-seater car, in general outline, follows the usual lines. It is fitted with a 14 in. boiler, the shell of which is of solid drawn steel; it is of the fire-tube type, there being 296 $\frac{1}{2}$ -in. copper tubes. A burner can be provided to burn either paraffin or petrol. If the former is used the burners are of heavier make, and the vaporising coils are larger. The burner, which is specially made for paraffin, will,

The "Gare" Patent Cushioned Tyre Company was represented by its special form of tyre, which is adapted for both heavy and light vehicles. The steel-shielded tube tyre consists of a light steel tube bedded in rubber, placed in an ordinary channel rim, and covered with an endless steel band, which forms the wearing surface; this is shrunk on, and is easily replaced when worn. The advantages claimed for the Gare tyre include its wearing powers on rough or broken roads, its non-skidding character, and the great resilience which is secured.

Serpellet steam-carriages formed the principal feature of the exhibit of the Speedwell Motor and Engineering Company, Limited. The Serpellet system, as also the 1902 improvements in the same, have already been dealt with in the *Journal*, so that only a brief reference is necessary. In addition to a 10-h.p. double phaeton (Fig. 90) a chassis was staged, enabling the general arrangement to be inspected. The engine drives by a single

FIG. 90.—THE SERPELLET 10 H.P. DOUBLE PHAETON.

chain on to the differential gear on the rear axle. The car carries enough paraffin, water, and lubricating oil for a 75-mile run without a stop; there is only a comparatively small amount of water carried, as the steam is condensed and returned to the reservoir; the lubrication is also automatic. The car has a long wheel base, equal wheels, extra heavy pneumatic tyres, torpedo-pointed or Panhard shape water reservoir in the fore part of the frame, large condensers, and the new automatic water-injector, which practically does away with hand-pumping. The control levers are grouped around the steering column, while both hand and foot-brakes are fitted. The illustration shows the silk-covered dust and heat screen which is fitted to the rear of the body. The car will, it is claimed, climb a hill of one in six with a full load, and attain a speed of 40 miles per hour on the level. The great attraction of the stand was undoubtedly the racing car with which M. Serpellet created a new record at Nice the

FIG. 91.—THE HOLLEY MOTOR-BICYCLE.

other week, covering the flying kilometre in 29½ seconds. Illustrations of this interesting vehicle were given in our issue of the 26th ult. The Speedwell Company also staged an 8-h.p. Renault light car with roomy *tonneau* body, a 1½-h.p. petrol motor combined with rudder, for use on ordinary rowing skiffs, and a large range of lamps and motor accessories.

The latest American motor-bicycle to be put on the English market is the Holley, of which an illustration is given in Fig. 91. It is being introduced into this country by Mr. D. H. Morgan, who explained its features to us. As will be seen, the frame of the machine is of special construction, the motor—which, at a speed of 1,500 revolutions per minute, develops 2½ h.p.—being built into it so as to form part of the seat tube. The ignition is electrical, while the explosive mixture is formed by a spray carburettor. The switch is contained in the left handle, as usual. The power is conveyed by a flat belt ¾ in. wide by 3-16 in. thick to a wood rim, which is made in one piece with the ordinary wood rim of the rear wheel. A jockey pulley is provided to the rear of the motor to get the necessary tension on the belt. The oil supply to the crank chamber is continuous, by means of a sight-feed lubricator. The petrol tank has a capacity sufficient for a run of sixty miles. The usual pedal gear is provided to start and assist the motor, although it is claimed that, in view of the high-powered motor, the machine will carry a twelve-stone rider up a gradient of one in eight without it being necessary for him to pedal. A back-peddalling brake is contained in the rear wheel hub, and a band-operated brake is fitted to the front wheel. Two-inch pneumatic tyres are used, the wheels being 28 in. in diameter. The new machine appears to be well constructed, and we shall watch its behaviour in practical use with interest.

Among the types of steam-cars shown were the Weston, which have attracted much attention since their introduction into this country. The models exhibited included a Weston Victoria with cane work panels—an effective combination enhancing the appearance of the carriage, a victoria to seat two passengers, a dog-cart phaeton, a Model A stanhope, and the touring car to which reference was made in our issue of March 29th. The touring car, of which we give an illustration in Fig. 92, has extra wide seating for two persons, and has water capacity to run thirty-five miles, the fuel-tank containing sufficient for double that distance. It

FIG. 92.—THE WESTON TOURING CAR.

has an ingenious concealed tool-chest in a let-down panel at the rear of the car, and the box running along the dash-board gives accommodation for luggage. The general features of the Weston cars are notable. The body is slung on a tubular frame, flexibility being ensured by means of three springs so attached that lateral vibration is considerably minimised. Compensating gear, amply enclosed, is provided, as well as central steering from a lever readily adjustable to any required height or angle. The boiler has 300 tubes, giving a heating surface of 45 square feet, and has a seamless shell, copper lined. It is wire-wound, tested to 700 lbs. cold water pressure, and has a safety valve blowing off automatically at 250 lbs., thus preventing that pressure being exceeded. The engine is of 7-h.p., and the crank-shaft is forged in one piece. A simple arrangement of burner is provided, and a feature is made of the water-lift illustrated in the *Journal* on February 8th, by means of which the tank can be replenished with nearly boiling water in five minutes without leaving the seat. Other special points include a feed-water heater, automatic water-pump, and a double-acting band-brake.

Bowden's Patents Syndicate, Ltd., had an exhibit of the uses to which the Bowden wire mechanism, which is now too well known to need a lengthy description, can be put in connection with motor-cycles and cars. In addition to a table on which were shown variable applications, such as the lifting of a 56 lb. weight, and the operation of a rudder from the bow of a boat, the Bowden Company exhibited a motor-quad in which the igni-

friction can be adjusted as required, so that no power is lost in ordinary running, but in the case of a sudden jerk the clutch will slip sufficiently to prevent any damage being done.

Since the Dechamps cars were put on the market some years ago, they have undergone considerable alteration. The latest models in general arrangement follow closely on Panhard lines, but comprise a number of detail features to which reference is

FIG. 93.—THE DECHAMPS 14-H.P. TONNEAU.

tion, carburettor, exhaust-valve lifter, band brake, and two-speed gear were all controlled and operated by Bowden wire mechanism. One simple adaptation of the stranded wire in the coiled and flexible conduit gives a double action most useful in the application of band brakes, as it holds the band in position on the drum, both for forward and backward travelling. A novelty is the application of the mechanism to the regulation of the carburettor. The levers are drawn in one direction by the Bowden wire, and in the others by springs. Sufficient resistance is introduced into the apparatus to allow it to remain where set. A chassis was also shown with engine fitted at rear of frame, and all controls connected up to the steering pillar by means of Bowden wires. Everything from steering downwards

made below. The vehicles are now being handled in this country by the Graphic Motor and Engineering Company, Limited, who exhibited a 7-h.p. car, a 9-h.p. tonneau, and a 14-h.p. tonneau in green with yellow lines. The 7-h.p. car is driven by a water-cooled vertical double-cylinder engine, the diameter of the cylinders being 95 mm., and the stroke 115 mm. The

FIGS. 94 AND 95.—ELEVATION AND PLAN OF DECHAMPS ADMISSION GOVERNOR.

is actuated through this convenient and reliable action. The Bowden motor-bicycle in its latest form was also on view. The motor is a Simms, with magneto ignition, and is arranged vertically behind the bottom bracket, giving a very long wheel-base. Transmission is by special roller chain to chain wheel on the back hub. The wheel is connected to the hub through the Bowden clutch. By turning a handle in the front of the head to right or left a quick pitch screw on the hub is rotated, so as to throw the inner conical surface of the clutch out of contact with the outer part, which is fixed to the hub. This is the position from which the rider starts the machine by pedalling in the ordinary way. When a fair speed has been got up the

FIG. 95.—THE DECHAMPS BAND BRAKE.

cylinder, cylinder head, and water jacket are in one casting the governor acts on the inlet, and in conjunction with it is a pedal accelerator. Four speeds forward and a reverse motion actuated by a single lever at the side are provided. The Dumont electrical ignition and self-starter is fitted to the motor, which enables the latter to be started from the driver's

seat. The following description may be taken as applying to both the 9-h.p. and 14-h.p. cars, the main difference being that the former is fitted with a two-cylinder (100 mm. diameter by 130 mm. stroke) engine, and the latter with a four-cylinder (95 mm. diameter by 115 mm. stroke) motor. Each cylinder is, together with its head and water jacket, cast separately and in one piece, the two or four being mounted on a common crank chamber. The inlet pipes are held in position by a bridge piece, which, by detaching two nuts from each, allows the pipes to be dismantled and the valves readily withdrawn. Electrical ignition is fitted together with the Dumont self-starting arrangement. The water circulation is maintained by pump and radiators. The centrifugal governor (Figs. 94 and 95), which is driven by a chain, acts on the gas admission close to the outlet from the float-feed carburettor. An accelerator, controlled by a pedal, is fitted, by means

six arms A. By pulling the hand lever a rotary motion (by means of a bevel and rack) is imparted to the double-threaded screw, the two segments of the brake band being thus drawn together. The 9-h.p. car has a wheel base of 6 ft. 2 in., and the 14-h.p. type 7 ft.

Popularly associated with lighting arrangements of the home, Price's Patent Candle Company, Limited, is also interesting itself in the lubrication of automobiles, and its Motorine oils were well displayed at the Exhibition. These are lubricating oils for the cylinders, engines, and bearings of petrol, oil, and steam motors. The Belmoline solidified oil for the gearing and axles of motors and carriages, Rangoon jelly for preserving the bright and plated parts of motors and cycles, lamp oils for motor-vehicles, etc., were also shown on the stand.

A good type of Acetyloid motor-car lamp was shown by Messrs.

of which the governor can be made non-acting when desired. Three speeds forward and a reverse motion, controlled by a single lever, are provided. The power is transmitted through a friction clutch (which is provided with a special spring adjustment) to the gear-box, in which is a train of sliding pinions as in the Daimler and Panhard systems. The latter drives the differential countershaft by means of enclosed bevel gearing, the usual pair of side chains connecting the differential shaft with the rear road wheels. A pedal actuates a double-acting band-brake on the differential, while a hand lever controls band-brakes on drums connected to the hub of each of the rear wheels. The latter are of special design; they are double acting and are actuated by a double-threaded screw B (Fig. 96), which draws on to the drum two half brake bands, which can be adjusted by means of the device T. The brake drum is not only attached to the wheel spokes, but is fixed on the hub by means of the

Worsnop and Co., Limited, who have given much attention to the efficient lighting of automobiles. The Acetyloid Search Light (No. 850) was exhibited. This is arranged to give from 50 to 250 candle-power light, and is fitted with red and green side-lights, and can be focussed to various distances. By a patented arrangement the light may be focussed on to the ground or straight ahead, an advantage that will be realised by those who have done any night driving. The voiturette lamp, which was also shown, is made on the same principle as the lamps for larger cars. The generator is fitted in the back part of the lamp, which is provided with plano-convex lens. Messrs. Worsnop and Co.'s Maxilux lamp is entirely self-contained, and has a protected arrangement for adjustment. Our review of this firm's stand must close with a reference to the "Clarissa" petroleum motor-car lamp, the special features of which are a silver reflector, ruby back light, chimneyless burner, and bevelled convex lens.

The Bradford Motor Car Company were somewhat late in taking up their position at the Show, but during the last few days two of the new Pieper cars—a 12-h.p. and an 8-h.p.—were on view. They came in for a large amount of well-merited attention, the 1902 models showing a marked improvement on previous productions of the Pieper Company. Fig. 98 gives a view of the 12-h.p. four-cylinder *tonneau*, a noticeable feature of which is the long wheelbase—7 ft. 6 in. The motor is on the lines of the Panhard; it comprises four cylinders, and runs at a nominal speed of 1,000 revolutions per minute. The cylinders and head are cast in one piece and made of a special quality of cast iron. The cylinder bore is 90 m.m., and the stroke 110 m.m. The base chamber is of aluminium, cast in two halves, with a plate at the bottom for easy access in adjusting the bearings. The engine is governed on the latest principle, by cutting out the supply of vapour at the carburettor. The latter is of the Longuemare float-feed constant level type. Electrical ignition, with Basse and Michel coils and contact, is adopted. An accelerator worked by the foot is provided, this increasing or retarding the speed of the engine as desired. The water is circulated by an improved long-bearing centrifugal pump, driven direct by gear-wheel from the crank shaft, and passes through large surface radiators. The lubrication of the cylinders and

that it is fitted with a two-cylinder motor and is a little shorter in the wheel base.

Much attention was devoted during Show week to the stand of Messrs. Chas. S. Rolls and Co., which was presided over by the Hon. C. S. Rolls. Occupying a prominent position was the 60-h.p. Mors racing car which he drove in the Paris-Berlin race last year. Standing at rest as it was, it was difficult to imagine that only a few days previously it had been travelling over French roads at a speed equal to about seventy miles per hour. Another interesting car was Mr. Leslie Bucknall's 40-h.p. Panhard touring carriage, with double *tonneau* and arm-chair front seats. This is finished in ivory white, with scarlet upholstery. Another example of the Panhard-Levassor Company's production was to be seen in a 10-h.p. Panhard light car of the latest type, with *tonneau* body and four-cylinder Centaure motor. Not the least interesting feature of the stand was the display of cups and medals won in recent years by Mr. Rolls, and a large collection of old prints and photographs relating to early mechanical and aerial locomotion.

Messrs. Bayliss, Thomas, and Company, Ltd., had a small but interesting stand on which three specimens of the well-known "Excelsior" motor-bicycle were shown. The first was fitted

FIG. 98.—THE PIEPER 12-H.P. TONNEAU

crank shaft is controlled from the dashboard. A paraffin supply is also fixed for cleaning the pistons and other working parts. There are three speeds forward and a reverse controlled by single lever, the transmission being on the lines of that adopted in the Panhard systems. The change gear wheels are of special quality steel, with broad wearing surfaces. The bearings are large and wide; and grease cups are fitted on the dashboard, so that bearings may be lubricated at any time by the driver. The differential gear is fitted on the countershaft, from which the power is transmitted direct to the road wheels by roller chains. The clutch is controlled by a foot pedal, and also is disconnected when the foot or hand brakes are brought into use. There are two brakes, one double-acting, worked by the foot and acting on a water-cooled drum on the countershaft. The hand brake has a rack to hold in any position desired by the driver, and operates double-acting band brakes on drums on each of the rear wheel hubs. The steering is controlled by a wheel on an inclined column, through irreversible worm gear, and the car will, it is stated, run straight without the wheel being held even over rough roads. The road wheels are of equal size, 32 in., fitted with phosphor bronze bushes and grease cups and shod with stout pneumatic tyres. The car, which complete weighs about 14 cwt., is fitted with a comfortable *tonneau* body in natural wood, and has every appearance of being both speedy and reliable. The 8-h.p. Pieper car is identical with the one described except

with the new 1½-h.p. motor, on the Minerva system. The machine is fitted with rim brakes on both wheels, a forward extension of the front mudguard, spring head, and the special Bayliss attachment for securing the belt pulley to the rear wheel. The next machine was the lady's motor-bicycle recently illustrated in the *Journal*. Lastly, we found the powerful gent's machine, with 2½-h.p. motor. This machine is suitable for drawing a trailer, and is the type with which the firm have scored so well in recent contests. A special tank is provided behind the diagonal tube for the lubricating oil, which is fed by gravity to the crank case. The machine is fitted with a multiple-ply belt, copper stitched, which is claimed to be non-stretchable.

The Ader system of motor-vehicles were shown by the Motor-Vehicle Engineering Company, who are introducing them into England under the name "Pegasus." Three cars were staged—a 10-h.p. *tonneau*, a 10-h.p. double phaeton, and a 15-h.p. double phaeton (Fig. 99). While the main features of the Ader system have not been changed since we described it at length in the *Journal*, many improvements in the details have been introduced. The 10-h.p. and 15-h.p. cars only differ in construction in the size of the motor and in the change-speed gear, which in the 10-h.p. vehicles gives three forward speeds, and in the 15-h.p. four speeds, a reverse motion being of course provided in both cases. The engine, the normal speed of which is about 1,600

revolutions per minute, comprises two inclined cylinders, the piston rods of which work on to a central crank shaft. The ignition is electrical, while the water circulation is by pump and radiators. The system of carburation is upon a new principle, and the mixture is admitted to

speed of the motor is at once reduced, the vibration of the carriage when brought to rest being thus reduced to a minimum. The method of transmission adopted is on similar lines to the Panhard system, through a friction clutch, gear-box, and chains. The forward and reverse motions are controlled by a single lever. Two brakes

the motor by a stop valve, much in the same way as steam is supplied to a steam engine. The governor acts on a throttle valve, and is so constructed and arranged in conjunction with the clutch and brakes that, immediately upon the withdrawal of the former, or the application of the latter, the supply of mixture is automatically decreased, so that the

are fitted, as also the standard inclined steering. As already mentioned, there are one or two special details in the Pegasus cars, to which we may refer at length in a subsequent issue. We may add that the 15-h.p. car exhibited has been purchased by the recently formed King's Colonial Imperial Yeomanry, who intend to use it for despatch work.

It has been known for some time that the Century Engineering and Motor Company, Limited, were devoting attention to light cars in addition to their well-known motor tandems. It was, therefore, with interest that we went through the details of the new 9-h.p. car (Fig. 101) that was staged on their stand. It is fitted with a well-finished *tonneau* body, in olive green, with light green lines. The frame is built low, and the wheel base is somewhat longer than usual. In the fore part is set an Aster 9-h.p. single-cylinder engine, which is provided with a governor acting on the admission; in conjunction with the latter is a hand-operated throttle. The water circulation is maintained by a pump and a Begbie-Audin radiator. The transmission is on the lines of the Panhard system, three forward speeds and a reverse motion, controlled by a single lever, being provided. An interesting feature of the car is a device to enable the driver, when travelling at night, to readily change the gear. The speed changing lever is fitted with a small brass bell, within which is a small electric lamp, which enables the driver at night to see directly where the notches are for the different speeds. The action of pulling the lever out of a notch completes the electrical circuit and causes the incandescent lamp to glow, this continuing until the lever is again in the right notch, when the current is broken and the lamp extinguished. One pedal controls the

per minute, but by means of the governor this may be varied between 250 up to 1,200 revolutions. A special form of commutator is used in connection with the electric ignition. The governor, which is of the centrifugal type, acts on throttle valves fitted in each of the induction pipes. A separate carburettor is employed for each cylinder, two switches being also provided in connection with the ignition, so that either of the cylinders may be stopped as desired. The water-circulation is maintained by radiators and a chain-driven slow-running pump. Only four gallons of water are carried. Four speeds forward and a reverse motion, controlled by a single lever, are provided. The change gear is divided into two pairs, one pair being enclosed in an extension of each of the two crank cases. The power is conveyed from the crank shaft through spur gearing to the clutch sleeve and clutch on the variable gear shaft. The second counter-shaft drives the rear wheels by means of two chains. The clutch, which is not fitted on the engine-shaft, as usual, but on the counter-shaft, is so arranged that a pressure of 10 lbs. on the clutch pedal is sufficient to withdraw it. Both male and female portions have opposed surfaces in cast-iron, and however much oil may get upon the surfaces in contact, no effect is produced thereby upon the holding action of the clutch. The clutch spring is very light, and fixed in an accessible position. The counter-shaft brake is

FIG. 101.—THE CENTURY 9-H.P. LIGHT CAR.

clutch and another both the clutch and a double-acting band-brake on the differential shaft. In addition a hand-lever actuates double-acting band-brakes on the hubs of the rear wheels. Steering is controlled by an inclined hand wheel, on the column of which the motor-controlling levers are mounted. The latter are of a special type, for, instead of racks being fitted to them, a friction device is employed, which provides for a very fine adjustment. The water and the petrol tanks are of sheet brass, and have a capacity of respectively seven and thirteen gallons. The car, which is fitted with equal-sized artillery wheels and 750 by 85mm. pneumatic tyres, weighs complete about 13cwt. Of the Century motor-tandems two were shown—one fitted with a 5-h.p. Aster motor, and the other with a similar engine of 6½-h.p., the latter being built for the county road surveyor of Donegal. The latest models of these well-known machines have so recently been described in the *Journal* that further reference on the present occasion is unnecessary.

There are a number of interesting features in the cars now being turned out by Messrs. James and Browne, two of which were shown at the Exhibition. The frame is built up of channel section steel, in the forepart of which is fitted a horizontal 9 h.p. two-cylinder, water-cooled engine, with fly-wheel set in the centre and revolving forward. There are no water joints to the cylinders, while the two exhaust valves are actuated by means of a single cam. The normal speed of the engine is 500 revolutions

mounted round the differential gear on the second counter-shaft, thus avoiding any stress being thrown upon the gear sleeves. The gear wheels are, by the way, very wide, and run very quietly. The castings carrying the sprocket wheel bearings are bored in position on the frame, so that absolute accuracy is obtained in this vital part. The brakes on the hubs of the rear road wheels are of a special expanding type, but as they were illustrated and described in our issue of February 22nd last there is no need to refer to them at length on the present occasion. By the employment of a neat and efficient compensating arrangement for brake application it has been possible to allow the frame sufficient elasticity and bending movement to ensure soft and comfortable running without undue shock. Ring lubrication is provided to all gear case bearings, and on the dashboard is a special multiple sight-feed lubricator which is closed and opened by means of a single tap. Steering is controlled by an inclined wheel, actuating a special rack-and-pinion arrangement in which there is no backlash. The single *tonneau* has a divided front seat, and is nicely finished in red and black, with light yellow wheels, and upholstered in dark green leather. The double *tonneau* car, with seating accommodation for six persons, is in red and black, with dark green wheels, lined with a lighter shade of the same colour, and upholstered in dark green smooth leather. The workmanship, both as regards under-frame and carriage body, is of an order which promises well for the future of the James and Browne cars.

The 1902 model Belsize car exhibited by Messrs. Marshall and Company bears but little resemblance to the original cars turned out by this firm. In addition to a complete vehicle fitted with a well-finished *tonneau* body (Fig. 102), they wisely included a *chassis*, so that the various parts could be inspected. The frame is of a special form and constructed of angle steel; in the fore part is set a two-cylinder motor developing 12 h.p. The cylinders are 100 mm. diameter by 110 mm. stroke, the

FIG. 102.—THE BELSIZE 12-H.P. TONNEAU.

normal speed being 800 to 900 revolutions per minute. The cylinder and head are cast in one piece, so that there are no water joints to give trouble. Following the latest practice, the governor acts on the throttle; it is actuated from the crank shaft, and is enclosed with a compact dust-proof case, forming practically part of the crank chamber from which it is lubricated. In connection with the governor is a hand accelerator. The valves are so arranged that by simply taking off one nut both they and their seats can be readily taken out. The carburettor is of the Longuemare spray type. Electrical ignition is adopted; the coil is placed on the dash board near the motor to obviate the necessity for long wires, and the make and break device is efficiently protected. The water circulation is maintained by pump and radiators; the latter is of special form, being disposed along the bottom side edges and the upper rear edge of the bonnet in such a way that air has free access to the radiating fins, which are made of aluminium. The power is transmitted through a friction clutch to the variable speed gear, which is of the Panhard type, and thence by a lower shaft, which drives the balance-gear axle through universal joints and bevel gearing. Three forward speeds and one reverse are provided, all controlled by means of one lever. Both the top and bottom shaft on the gear-box are easily removable, and each gear wheel can be replaced independently of the others. Equal-sized road wheels are of the artillery type, while the steering is of the usual inclined hand wheel type. A special feature of the Belsize car is to be found in the brakes. A foot-brake controls expanding brake blocks, which act on the inner surfaces of drums attached to each of the rear road wheels. On the outer surface of the drums are ordinary double-acting band-brakes actuated by a hand lever. All parts of the car are made on the interchangeable system, each being given a distinct number. Complete, it weighs about 14½ cwt.

Various patterns of the well-known Stirling voitures were to be seen on the stand of Stirlings' Motor Carriages, Limited, including a two-seated phaeton (Fig. 104), a three-seated phaeton, and an attractive looking four-seated dogcart. These vehicles have already been described in the *Journal*, but it may be mentioned that they are fitted with a 4½-h.p. horizontal governed motor, having tube and electric ignition, rotary circulating pump and radiator. The change gear is adapted to give three forward

speeds (6, 12, and 18 miles per hour), and a reverse motion. The novelty on the stand was, however, the new 12-h.p. "Stirling" public service car (Fig. 103), the identical vehicle whose progress in the late Glasgow-London trial was so unfortunately arrested by a hot bearing. The two-cylinder engine is placed in the front of the frame above the steering axle springs, and well water-jacketed. Both tube and electrical ignition are fitted, while a governor is provided, which acts on the admission. The engine is of the slow-running type, the normal speed being about 750 revolutions per minute. The water circulation is on the thermo-siphon system, a large range of radiating coolers formed of Clarkson's perpendicular cooling tubes connecting the top and bottom tanks taking the place of the usual dashboard. Three speeds forward and a reverse motion are provided, the power being transmitted through a large friction clutch to a gear-box, and thence by an universally-jointed shaft and bevel gear to the

countershaft, upon the ends of which are toothed pinions gearing with two internally toothed wheels, bolted to the spokes of the rear road wheels. A water-cooled band brake is mounted on the longitudinal shaft, while the rear wheel hubs are provided with special double-acting and expanding band brakes. The wagonette body is of plain but strong construction, and comfortably accommodates sixteen passengers. The driver steers the car by means of a horizontal hand-wheel, the change gear and brake levers being set closely to his hand. The road wheels are of strong

FIG. 103.—THE STIRLING 12-H.P. PUBLIC-SERVICE CAR.

construction, and are shod with solid rubber tyres. Particular attention has been devoted to the various bearings, which have been made of extra length in view of the work demanded of a public service car.

M. E. Vicart exhibited three motor-car bodies of good design. The *tonneau* were roomy and convenient, one having a side frame of aluminium of gauze-like appearance, to reduce weight without detracting from the strength of the body.

While the majority of the cars exhibited had petrol motors of the four-cycle type, there were one or two in which the engine was of the two-cycle type, giving an explosion at each revolution of the crank-shaft. In this category we noticed a handsome victoria with hood, shown by Mr. Ralph Lucas. In view of the several interesting features it comprises, it was a wise step to also include a *chassis* in the exhibit. The frame and the lower part of the body are constructed of sheet steel and form one rigid

FIG. 104. THE STIRLING PARISIAN PHAETON. (See page 217.)

piece. The motor, which is located transversely at about the centre of the frame, has a single cylinder containing two pistons 4 in. diameter by 4 in. stroke. The pistons work outwardly on to two crank shafts, each having a pair of flywheels, and being entirely enclosed in crank chambers. The crank-shafts revolve in opposite directions, and they both drive by enclosed bevel gearing carrying on to a countershaft the change-speed gear, and revolving at the same speed as the engine. The cylinder is air-cooled in its centre, and is water-jacketed at each end where the piston travels. Air is drawn into the crank chambers during the inward stroke, and it is, during the outward stroke, forced into the combustion chamber, the fuel being supplied to it on the way. The fuel feed is through a needle valve, which is opened by the suction of the engine acting on a diaphragm, and it is fed on to a butterfly valve, which also acts as a throttle valve for regulating the power of the motor. The governor, which is of the enclosed centrifugal type, acts on the throttle valve. Either petrol or paraffin can, it is stated, be used. The same fuel feed arrangement is used for either fuel, a two-way cock being generally used. Using petrol, the engine develops 8 h.p., and with paraffin 9 h.p. The normal speed of the engine is about 1,200 revolutions per minute, but this can be increased up to 1,600 revolutions or reduced to 250 revolutions per minute, this being done by regulating the tension of the governor spring. The ordinary valves found on four-cycle motors are dispensed with; one piston serves to open and close the exhaust port, and the other does a similar duty for the inlet port. Forced lubrication of the cylinder is employed, and the big ends of the connecting-rods are lubricated through hollow crank-pins. A starting-handle is fitted to each end of the countershaft, so that the engine can be started to run in either direction, the ordinary reversing gear being dispensed with. Electrical ignition is adopted, while the water circulation is on the thermo-siphon system. As already mentioned, the power is transmitted through bevel gearing to a transverse shaft. Two speeds are provided; a Crypto gear, giving a reduction of three to one, is employed for the low speed, this being controlled by a pedal. The high gear is brought into operation by a Champion clutch, this being operated by drawing the steering-pillar towards the driver, it being pivoted below for this purpose. From the countershaft to the live rear axle the power is conveyed by a universally-jointed shaft and bevel gearing. The axle is provided with a straight-tooth balance gear. The actual speed of the car, under ordinary conditions, is regulated by a small button in the centre of the steering-wheel which works against the action of the governor. A specially-shaped water-tank, having a large cooling surface, is placed in front. The car is built strongly. Its weight complete is about 12 cwt. A hand-

brake is fitted to the countershaft, while a hand lever actuates emergency shoe brakes on the solid-rubber tyres.

Safes of every kind, deed boxes, party and warehouse walls comprised the exhibit of Mr. John Tann—a name well known in connection with safes for resisting fire and burglars. Book and deed safes of ingenious construction were a subject of interest to motorists and firms engaged in the industry in common with all commercial men.

At the stand of Messrs. John Child Meredith, Limited, a new 9-h.p. car was staged. It is fitted with a two-cylinder horizontal motor in the fore part of the frame, under a Wolseley type bonnet, the cylinders being set opposite to one another with a central crank-shaft. The normal speed of the engine is 800 revolutions per minute; the ignition is electrical, while the water-circulation is maintained by a gear-driven pump and radiators. In line with the engine-shaft, and connected with it by a friction-clutch, is a shaft on which is mounted a train of three sliding bevel pinions, enclosed in a gear-box; three speeds forward and a reverse motion are provided, controlled by a single lever. The three pinions mesh at will with a triple bevel wheel placed on the end of a longitudinally inclined shaft, which in its turn rotates the live axle by means of the bevel gearing surrounding the differential gearing thereon. The three forward speeds are obtained by sliding the bevel gear sleeve, and bringing the required combination of gear into mesh. The car is fitted with inclined steering, *tonneau* body, and weighs about 15 cwt. On the same stand was an interesting little two-seated car, of which an illustration is given in Fig. 105. It is known as the "Abingdon," and is fitted with a 3½-h.p. vertical single-cylinder water-cooled engine, located under a bonnet in the fore part of a channel steel frame. The water-circulation is on the thermo-siphon system, the tank, which is attached to the dashboard, being fitted with radiating fins. Two forward speeds and a reverse are provided, a chain connecting the engine-shaft with a countershaft which carries two pinions within a gear-box meshing with two spur-wheels on a sliding sleeve on a secondary shaft, a single chain connecting the latter with the rear live axle. The reverse is obtained by a spur-wheel on the outside of the gear-case. A pedal controls hand-brakes on the hubs of the rear wheels, while hand-operated emergency tyre brakes are also fitted. Steering is controlled by an inclined hand-wheel. The car complete weighs about 4½ cwt., and can, it is stated, attain a speed of 20 miles per hour. Messrs. Meredith have striven to produce a reliable little car at a moderate price, and,

FIG. 105. THE "ABINGDON" CAR.

judging from a brief inspection, it appears to be strongly built throughout. We may add that the retail agents for the little car are Messrs. Coxeter and Sons, of Abingdon. In addition to the complete cars Messrs. Meredith had a large display of accessories, including accumulators, coils, horns, lamps, switches, sparking-plugs, and the G.O.M. carburettor, recently illustrated in the *Journal*.

(To be continued.)

MOTOR-VANS AND THE POST-OFFICE.

SEVERAL attempts have been made to further the cause of automobilism in the mail-service, and at Reigate and in Lincolnshire successful experiments have been carried out. Still the laggard course of the postal authorities has not been quickened; and horses are employed where automobiles might well be utilised. A new venture was, however, inaugurated on the 1st inst., which will, let us hope, be the forerunner of a general movement throughout the country, leading to the supersession of the horse-drawn mail-van. We refer to a new method of carrying parcels between Liverpool, Prescot, Warrington, and Manchester. This system of carrying the parcels will do away with the plan of horse-hauled coaches established in April, 1890. Mr. F. Salisbury, the postmaster of Liverpool, evinced great interest in the heavy vehicle trials which were held at Liverpool last year, and it is in a large measure as the result of the impressions he then formed, together with the assistance he has received from Mr. R. Barrett, superintendent of the parcels post department of the Liverpool General Post Office, that the new service has been called into existence. It will be kept up with three vans, two in regular use and one spare vehicle for emergencies. The three vans are all of the same type, and bear the initials "E. R." and the words "Royal Mail—Liverpool and Manchester." The contract for carrying the parcels is in the hands of the British Electric Traction Company, of London, who have sub-let it to the Motor Haulage Company, of Manchester. The motor-vans have been built by Messrs. G. F. Milnes and Company, Limited, the vehicle having been specially designed for the class of work for which it is intended. It is fitted with a four-cylinder Daimler engine with the Simms-Bosch magneto-ignition and timing-gear. It is 16-b.h.p., and has four speeds and one reverse. Externally, the van very much resembles the old type of coach. The floor space inside the van is 10 ft. 6 in. by 5 ft. 6 in., and, in addition, there are facilities for carrying a large number of baskets on the roof of the car. At ten o'clock on the night of Thursday, the 1st inst., these first motor postal-vans were started, each containing over a ton of parcels to be distributed in the towns above mentioned, and such towns surrounding them as Wigan, Bolton, Bury, and other branch places by carts.

In exact correspondence with the departure from Manchester a motor-van left the Liverpool Parcels Post Office, pausing with the Manchester van, at Warrington, and reaching Cottonopolis just about the same time the other van arrived at the great shipping centre. About thirty-five minutes in time is saved in the new service. The motor-van starts a quarter of an hour later than the coach which it has displaced, and gets to its destination twenty minutes earlier. Had it been thought needful the saving might have been greatly increased, for the van is capable of a pace of 16 miles an hour. As it is, the economy in time that is effected is simply a mile an hour. A further advantage secured consists in the increased storage capacity of the van, which will contain 30 cwt. (holding thirty-six baskets) as against the 18 cwt. (twenty-four baskets) of the coach.

There was a large gathering at the Manchester Parcels Post Office to see the departure of the van. From the Post Office there were present Mr. J. Philips (postmaster and surveyor), Mr. H. Hartley (chief clerk), Mr. A. Rogers (chief superintendent), and Mr. T. Sawyer (chief of the parcels post department). Others present were Mr. F. E. Baron, Mr. J. V. Kitchener (chairman of the Motor Haulage Company), and Mr. H. G. Burford (manager of Messrs. G. F. Milnes and Co.'s motor department). The van was decorated with flags and flowers. The Postmaster said a few words in regard to the potentialities of the motor system. Mrs. Philips then broke a bottle of wine on the wheel of the van and said, "I christen this car the 'Alice,' and wish it God-speed." The National Anthem was sung, the conductor sounded the horn, and at 10.15, amid cheers, the van made its way out of the shed, and sped along Deansgate and on to the old Liverpool road.

The departure of the motor-vehicle from Liverpool for Man-

chester was watched with great and curious interest by a large number of people. Mr. Salisbury, the postmaster; Mr. Barrett, superintendent of the Parcels Post; and several other officials were present, in addition to Mr. J. S. Critchley, head of the automobile department of the British Electric Traction Company.

HERE AND THERE.

A LARGE model of Dr. Barton's airship will be on view at Wembley Park on Whit-Monday.

THE Polytechnic Cycling Club held the first motor-bicycle paced race for amateurs on the 1st inst.

MR. G. GAWLER, of Stafford House, Bath Street, Chard, is now keeping a stock of motor-spirit.

THE Electric Carriage and Storage Company, Limited, has been formed with a capital of £100 in £1 shares.

MESSRS. T. COOK AND SONS are now conveying tourists between Brussels and the battlefield of Waterloo by motor-car.

SIR J. H. A. MACDONALD, K.C.B., Lord Chief Justice Clerk of Scotland, has suggested the formation of an automobile museum.

THE suggestion that there should be a special race for 7-h.p. Panhards at Bexhill has been disapproved by the Committee of the Automobile Club.

THE Coventry Eagle Company are making a speciality of trailing cars for use with motor cycles. The attachment to the bicycle is by means of a universal joint and clip. The joint is composed of steel, all wearing parts being carefully hardened. The U-shaped arms are made to revolve laterally and perpendicularly, in a semicircle, the pins locking these being riveted by a special process. The clip is fastened to the arms by a bolt and nut, which is slightly riveted over, and made so as to revolve, in order that the bicycle, which is not always perpendicular—in turning a corner, for instance—may in no way interfere with the horizontal position of the trailer. In this way the trailer is unaffected by any change in the perpendicular plane of

the bicycle, or by any slight side movement. The clip by which the trailer is fastened to the bicycle is attached to the seat pillar. Provision is also made by which the trailer may be attached to bicycles of various heights of frame, by means of a telescopic adjustment, the top part of which slides or telescopes into the bottom part. To obtain perfect security, when the tube is adjusted to the required height, a small bolt is put through both tubes, thus securely fastening them together. The trailer itself is strongly made of wickerwork, and is carried on carriage springs. The weight of the vehicle is from 30 lbs. to 35 lbs. The wheels are fitted with pneumatic or cushion tyres, and are built with good bearings and detachable mudguard.

LORD KINNOULL has become a motorist.

TO-DAY (Saturday) the members of the Yorkshire Automobile Club will have a run to Ripon.

MR. W. H. KITTO, A.M.I.M.E., of Hartington Road, Chiswick, is now representative in London for the sale of Gobron-Brillie cars.

MEMBERS of the Manchester Automobile Club have secured very reasonable terms for putting up their cars at the Albion Hotel, Manchester.

A CO-OPERATIVE association has been formed among residents of Montlucon, France, to house and keep in repair their automobiles, to buy accessories, etc.

THE electric engineers on the Leeds Tramways staff have found a motor-car for four passengers of great service in visiting outlying portions of the several routes at night.

VISITORS to Teignmouth (Devon), will be interested to know that Mr. W. Bobbett, of the Quay Extension Road, supplies petrol and executes repairs to motor-cars.

THE Electric Landulet Company, Limited, inform us that as from the 1st inst. all communications should be addressed to the head office, Niagara, York Street, Westminster.

ON Saturday Lord Suffield visited the Daimler Company's works, and made a minute inspection of the 22-h.p. carriage now being constructed by the company for His Majesty the King.

ON Saturday last the members of the Midland Automobile Club had a run to Wroxhall Abbey, near Warwick, where the members took tea with the president, Mr. J. Broughton Dugdale, J.P.

AT Evreux, on Friday, last week, Osmont, the professional motor-cyclist, covered a mile, with a flying start, on a De Dion motor-tricycle in the record time of 56 1-5 sec., beating the old record by 3-5 sec.

THE Streatham Motor-Car Company, of 27, High Road, Streatham, have been appointed sole Southern agents for "Cudell" cars. They undertake repairs of all kinds, have an inspection pit, keep a stock of petrol, lubricating oils, and accessories.

ON the Crystal Palace track, on Saturday last, Mr. G. V. Rogers, on a Mitchell motor-bicycle, made an effort to lower the British record for five miles, and at his second attempt covered the journey in 9 min. 3 4-5 sec., which is 3-5 sec. inside the previous best.

WHITSUNTIDE will see a large number of motor-cycle races. In addition to those already mentioned, there will be five-mile handicaps at both Dover and Tunbridge Wells on Whit Monday, and a five-mile handicap and one of three miles at Canterbury on Whit Tuesday.

ON Saturday evening a serious accident occurred to one of the motor-buses running in public service at Scarborough. The

THE FIRST MEET OF THE MOTOR CYCLING UNION OF IRELAND IN PHOENIX PARK, DUBLIN, APRIL 26TH, 1902.

MR. ALFRED HARMSWORTH considers 120 miles a good day's run on an automobile, and advises purchasers to see how the cars they intend to buy can tackle hills with gradients of 1 in 8½.

WITH reference to the "Gladiator" record which appeared in this company's advertisement in the last issue, the Aston Hill mileage should have read "16.25 per hour" and not "sixteen miles per hour," as stated.

THE Roadway Autocar Company have lately issued a handy little book of instructions relative to the management of Mors cars. The booklet will be found useful by all motorists who drive this well-known type of vehicle.

A THREE-MEASURE lubricator has been found on the main road between Warrington and Manchester. The owner is invited to apply to the British and Foreign Motor-Car Company, Limited, of 27, Islington, Liverpool, for the return of the same.

A CYCLING and motor sports meeting is to be held at the Cricket Grounds, Butts, Coventry, on Whit-Monday, May 19th. The programme includes a one mile motor-bicycle contest, limited to motors of not more than two and a half inch cylinder bore.

THE customs duty on motor-cars imported into British Guiana has been fixed at 80 dols. per car for vehicles not seating more than four persons. For vehicles having accommodation for more than four an additional duty of 20 dols. per seat is imposed.

chain came off and, the 'bus gradually gaining impetus, rushed along at a great pace until Eastborough was reached, when it ran into a brick wall. The 'bus was badly damaged and three passengers much cut about their heads and faces.

MR. G. F. PEDLEY, late manager of the Daimler Company, Limited, has been the recipient of a handsome gold watch and diamond scarf pin, presented to him by the foremen and staff of the company on his resignation of his position. Mr. W. H. Proctor made the presentation, and in responding Mr. Pedley expressed his best wishes to his successor, Mr. E. M. C. Instone.

ON this page we reproduce a photograph taken by Messrs. Lafayette, of Dublin, of the first meet of the Motor-Cycling Union of Ireland. The group is an interesting one, including as it does many celebrities of the Irish motor-cycling world. Mr. J. B. Dunlop, the President of the Union and the inventor of the pneumatic tyre, is in the front seat of the quad in the left of the picture.

THE Motor Cycling Club, intend making Bexhill their rendezvous for the coming Whitsuntide holidays. A party will leave London on the afternoon of the 17th inst., and journey to Folkestone, calling at Tunbridge Wells on the way down for tea. On Sunday the members will go to Bexhill, returning to town on Monday evening. Providing the weather is fine a very enjoyable time should be spent.

CORRESPONDENCE.

ROADS AT HASTINGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the attention that is being paid to the motor rack at Bexhill, there is little left to be desired, and the only pity is that the track is not a longer one; but I feel it a duty to caution those motorists who visit this charming little town against the dangerous condition of some of the main highways in the neighbouring towns of Hastings and St. Leonards. Many of these have been for a long time in a very rough and deplorable condition, and anything like fast travelling over them might lead to serious disaster.—Yours faithfully,

A MOTORIST.

GRADIENT WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent *re* the gradient of Garbold Hill. In the first place I may mention that the name is Parbold Hill. The rise is 440 feet in one mile, making an average of exactly 1 in 12. The steepest part is near the top, and is 1 in 6. I have obtained the information from the surveyor, so that my Company's Vulcan cars can be guaranteed to be able to climb a hill with a known gradient.—Yours truly,

J. HAMPSON.

In consequence of the pressure on our space several letters are held over till next week.—Editor, *M.C.J.*

MOTOR MANUFACTURING COMPANY, LIMITED.

An extraordinary general meeting of the Motor Manufacturing Company, Limited, was held on the 1st inst., at Winchester House, Old Broad Street, E.C., Mr. Roger W. Wallace, K.C. (the chairman), presiding. The Secretary (Mr. Alfred Burgess) having read the notice convening the meeting, the Chairman said that one of the first things that would have to be done would be to put the management on a better footing. It would also be necessary to cut down the inflated capital of the company. The wisest course was to write down the assets of the company to very near their approximate cash value, which would amount to between £70,000 and £80,000; so that they would then be in a position of feeling that the nominal value of their capital was its actual value, and that when money was earned they would be able to pay a dividend upon it. With regard to the business itself he was pleased to say that they were getting standard types of cars which were being ordered by customers, and those types were going to be kept up—of course, improving them as they went along—but they were not making further experiments, which had wasted so much money in the past. He was pleased to state that at the Motor Exhibition they received a large number of orders for standard types. There would, of course, have to be new arrangements for selling the goods. The present premises in Holborn were inefficient, and they ought to move to some place more accessible to customers, and also the repairs ought to be done at some other place. He would also see that fresh blood was introduced both on the directorate and otherwise, to make one final effort to see if they could not turn the disastrous failures of the past into something successful in the future. He then moved the following resolution:—"That the provisional agreement submitted to this meeting, and which agreement is dated April 14th, 1902, and made between Alfred Burgess, on behalf of this company, of the one part, and William Ernest Shephard (as trustee for a proposed new company, which is to bear the same name) of the other part, being an agreement for the sale of the undertaking of this company in part consideration of the allotment of shares in such new company credited as partly paid up, be and the same is hereby ratified and approved, and that the directors be and they are hereby authorised to affix the common seal to such agreement, as token of ratification, and to carry the said agreement into effect, and to accept office as directors or some of the directors of the new company, and to enter into any agreements on their own account in respect of the placing or underwriting of shares in the new company, or of the taking up of any shares not claimed by the members of this company." Mr. H. Buckea seconded the resolution.

Mr. Glass said that all the meetings of the company had been held for the purpose of recording failures. The history of that company was simply a long record of weak management allied with magnificent promises and dismal failures. At the last meeting Mr. Gretton assured them that mismanagement was going to be a thing of the past, and the company was going to have a great future. They were also told that their patents were very valuable indeed. He did not think one single car of the Iden patent had been seen in the streets, although these patents had cost the company a large amount of money.

Mr. Sadler moved as an amendment, "That this meeting of the shareholders of the Motor Manufacturing Company, Limited, refers back the proposals in the report for the earnest reconsideration of the board."

Mr. J. H. Gretton maintained that the whole of their troubles had resulted from the bad basis upon which the predecessors of the company had existed. Even in the second company the board of directors was appointed in such a manner that it was bound to bring the company to ruin, and it was not until after a certain time they were able to find that out, and to get rid of all the bad features of the administration. When they reconstructed the company on the last occasion those gentlemen who were responsible for forming the Great Horseless Carriage Company still held

a large interest in the company, and forced them to pay them out, and consequently took a very large portion of the money which the shareholders gave them to carry on the business. The company recently received a large order from South Africa to provide conveyances to run from Johannesburg to the mines. If they wanted to make a successful manufacturing business they must spend a great deal of money.

Mr. Henry Sturme seconded the amendment, and the chairman replied to his remarks with considerable warmth. After further discussion the amendment was put to the meeting, and was rejected by a very large majority, and the resolution was carried with only three dissentients. The Chairman then moved that the company be wound up voluntarily. This was seconded, and unanimously agreed to.

NO LIGHT.

ON Tuesday, Mr. Plowden heard a summons at the Marylebone Police-court, issued at the instance of the police against Frederick Parish, of 28, Portland Terrace, St. John's Wood, N.W., for driving a motor-tricycle within one hour after sunset and one hour before sunrise without having a lamp so constructed and placed as to exhibit a red light in the reverse direction to that in which he was proceeding. Fined 1s. and costs.

ALLEGED NEGLIGENT AND UNSKILFUL DRIVING OF A MOTOR-CAR.

At the Brompton County Court, on Tuesday, before Judge Stonor, Mr. Henry Clark, a greengrocer, brought an action against Mr. J. Lewis, of the firm of Messrs. Lewis and Lewis, engineers, Fulham, claiming £26 for loss sustained owing to the alleged negligent and unskilful driving of a motor-car by the defendant.

The plaintiff stated that on March 6th last he was out with his cart, his son holding the horse's head. The cart was quite stationary and drawn up close to the kerb. Suddenly the defendant, driving a motor-car, came rapidly round the corner, and although his (plaintiff's) daughter, who was near the cart, called out to the defendant to stop, the motor-car still came along on its wrong side and collided with the off front wheel of the cart. The pony shied, knocked down the son, and one of the wheels ran over the lad's leg. The vegetables and fruit were pitched out of the cart and spoilt.

Mrs. Jane Palmer gave evidence proving beyond doubt that the plaintiff's cart must have been on the wrong side of the road, and supporting the defendant's case that the cart turned and caused the collision.

Mr. Mozley-Stark, solicitor for the plaintiff, intimated that he felt it useless to go further with the case. His Honour accordingly found in favour of the defendant, and allowed costs.

THE ROAD CARRYING COMPANY, LIMITED.

THE statutory meeting of the Road Carrying Company, Limited, was held on Monday, at the Exchange Station Hotel, Liverpool, Mr. G. H. Cox presiding. There were also present the Hon. Arthur Stanley, M.P., Messrs. R. O. Burland, F. R. Dixon-Nuttall, Max Muspratt, G. W. Paton, and T. Thornycroft Vernon, directors; E. Shrapnell Smith, Secretary, and others. The Secretary having read the notice convening the meeting,

The Chairman said the meeting had been called in compliance with section 12 of the Companies Act of 1900. Since the company was registered, preparations had been pushed forward for actually beginning the business of road carriers by means of motor-wagons. Ten wagons had been ordered, but the earliest delivery of any of them could not be obtained prior to June 10th. The company would probably run between Liverpool and Blackburn during the night, and within the radius of twelve to fifteen miles of these towns during the day. They had had many offers of freight at remunerative rates, both outwards and inwards. For reasons which they considered good, the board had decided to add a light car department to that of the heavy wagons, and had accepted the following agencies:—The Daimler Motor Company, the Gardner-Serpollet steam cars, and the De Dion-Bouton, Limited. Further, an agreement was under consideration by which they would be able to supply the electric carriages of the City and Suburban Electric Carriage Company, Limited. The company would be in a position to store, clean, adjust, repair, and insure motor-carriages of all descriptions, while in their Liverpool garages, at 20, Hardman Street, and at 26 to 34, Vauxhall Road. He concluded by moving the adoption of the report. The Hon. Arthur Stanley seconded, and the motion was approved.

Subsequently an extraordinary meeting was held, at which it was resolved, on the motion of the Chairman, seconded by Mr. Max Muspratt, that one of the articles of association be altered to allow of the first annual meeting of the company to be held in 1903 instead of 1902. A vote of thanks to the chairman, proposed by the Hon. Arthur Stanley, was heartily carried, and the chairman having briefly replied, the proceedings terminated.

FURIOUS DRIVING CASES.

F. PARISH, 28, Portland Terrace, St. John's Wood, London, was summoned at the Market Harborough Petty Sessions for furiously driving a motor-car at Kibworth Harcourt on March 17th. Mr. Rowlett, solicitor, Leicester, appeared to prosecute; defendant did not appear when first called,

and subsequently a telegram was received saying that he could not get there in time. Mr. Rowlatt pointed out that the case had been adjourned once before on a plea of insufficient notice, and the telegram was not sent off till within a short time before Parish should have arrived. The Bench ordered a warrant to issue for his apprehension. At the adjourned hearing, when he was brought up on a warrant, the defendant was fined £10, including costs, with an alternative of two months' hard labour.

ALFRED HURN, driver, and W. S. Cunard, owner, of Hawthorn Hill, Bracknell, Bucks., were charged at St. Neots with furiously driving a motor-car at Buckden on March 30th, 1902. Police-constable Hodson and Leonard Mann, of Buckden, proved the charge, and said defendants were travelling over 27 miles an hour. The Bench imposed a fine of £5 and £1 costs.

At Huntingdon Division Petty Sessions, A. L. Humphreys, of 187, Piccadilly, London, has been summoned for driving a motor-car at extreme speed. Police-sergeant Storey said on March 28th, at 12.15 p.m., he was at Melcham's Bridge, on the Old North Road, when he saw a motor-car approaching at a furious rate. It went 739 yards in one minute two seconds, which worked out at the rate of 24 miles an hour. He stopped the driver, who gave his name and address. Fined £2 and 3s. costs.

J. SCRIVEN was charged at the Bradford West Riding Police Court with furiously driving a motor-car. A police-constable deposed that defendant's car covered 400 yards in thirty seconds. The car was thus travelling at the rate of about 30 miles an hour. A fine of £5 and costs was inflicted, in default a month's imprisonment.

At the Lambeth Police Court, Robert Rouse, of Tottenham Court Road, W.C., was summoned by Sub-divisional Inspector Peckover for driving a motor-carriage at a greater speed than was reasonable and proper having regard to the ordinary traffic on the highway. Police-constable Easton, 46 L, stated that on the night of the 4th inst. he was in the New Kent Road, when he saw a motor-car coming down the road at a terrific speed. He took out his watch and found that the car covered 120 yards in seven seconds. The defendant's representative said the defendant would plead guilty, although he did not think he was going quite so fast as the constable said. Mr. Francis ordered the defendant to pay a fine of £3 and 2s. costs.

"ROUGH JUSTICE."

(Das Schnauferl. Munich.)

B. H. FLINT, of Arklow House, Ramsgate, has been fined £5 and 10s. 2d. costs, at the Ramsgate Police Court, for driving a motor vehicle at a greater pace than twelve miles an hour. The police said the pace was thirty miles an hour, a statement contradicted by the defendant, who, however, admitted exceeding the legal limit.

GEORGE TAYLOR, New Street, Chelmsford, has been charged before the local county bench. In the result he was fined £5 and 18s. 6d. costs, for driving a motor-car at a greater speed than twelve miles an hour at Broomfield.

BERTRAND CHARLES WOTTON, Thornton Heath, Surrey, was charged at Grinstead with having driven a motor-car at a greater speed than 12 miles an hour at Babingley on March 31st. Defendant totally denied the speed, and the case was dismissed, the Chairman remarking that there was not sufficient evidence.

At Chippenham Police Court last week Gaston Laurent, motor-car driver to the Duke of Beaufort, was summoned for driving his Grace's car through Chippenham, on April 11th, at a speed exceeding 12 miles an hour. A fine of £3 and costs was inflicted. In another case heard against the same defendant for furiously driving a motor-car, it was stated that Laurent was driving the Duke's huntsman. In this case the Bench inflicted a fine of £7, to include costs.

At Brighton, Mark Stowman has been fined £1 9s. and costs for driving a motor-car to the danger of the public on April 13th. Police evidence was to the effect that the defendant travelled at the rate of 30 miles an hour—as shown by calculations based on an ordinary watch.

THOMAS WOODS has been fined £2 and 11s. 6d. costs at Brentwood Police Court for driving a motor-car at an excessive speed.

On Saturday, William Baker, of London, pleaded guilty at Winchester to driving a motor-car at an excessive speed, at King's Worthy, on the 28th March. P.C. Deacon said the defendant covered a measured distance of 400 yards in forty seconds, or at the rate of twenty miles an hour. The Bench imposed a fine of 40s. and 8s. costs.

WILLIAM SHEPHERD, who was driving a motor-car from London to Bournemouth, was summoned for driving a motor-car at an excessive speed at King's Worthy. Defendant pleaded guilty at the Winchester Court, and was fined 40s. and 8s. costs.

At the Birmingham Police Court, Daniel Willetts, of Bowling Green Lane, Stourbridge, was summoned for furiously driving a motor-tricycle along Broad Street on the 21st ult. The evidence of Police-constable Brown, who followed the offender on his bicycle, went to show that defendant was travelling at a speed of from twelve to fourteen miles an hour, at which pace he covered the whole length of Broad Street. Defendant, who said he did not think he was going so fast, was fined 10s. and costs, with the alternative of fourteen days' imprisonment.

WILLIAM JAMES MABER, a Mountain Ash ironmonger, was summoned at the Llandaff Police court on Monday for driving a motor-car at a furious rate. P.C. Enoch Jones stated that the motor was careering along at a rate of 100 yards in seven seconds. The Bench imposed a fine of 20s. and costs, or fourteen days.

GEORGE MOODY, of Llandudno, motor driver to the late Duke of Westminster, was charged at Penrhyndeudraeth with having driven a motor-car through Merioneth at an improper speed. A police-officer said he went at a rate of twenty to twenty-four miles; a mason said he went at twenty to twenty-five; another mason said he covered 100 yards in two seconds. Moody denied that he was going at more than eight miles an hour, observing that it was only geared up to twelve miles. A fine of £3 with £1 7s. costs was imposed.

ON another page of the present issue we reproduce an interesting photograph taken during the recent heavy vehicle trials from Paris to Nice. It shows the French Military Commission which, on a Serpollet car, accompanied the vehicles on their long journey. At the wheel is Captain Genty, and at his side is Colonel Lambert. The occupants of the rear seats are Commandants Mengin and Ferrus, while standing at the rear of the car is M. Paul Meyan, of our contemporary *La France Automobile*, the organiser of the trials.

THE first annual general meeting of members of the Scottish Automobile Club (Western section) was held in Glasgow last week, Mr. Jas. R. Nisbet presiding. The report by the committee showed the membership at date to be fifty-eight, and the balance at the credit of the Club at 31st January, 1902, £25 7s. 4d. The committee for the ensuing year were elected, with Mr. John Adam, of Larchgrove, as chairman, and Mr. Robt. J. Smith, C.A., Glasgow, as honorary secretary.

ON Tuesday, in the Companies' Winding-up Court, a petition was presented by Mr. Charles Friswell for the compulsory winding up of the British Motor Traction Company, Ltd. Mr. Muir, in support of the petition, stated that an arrangement had been come to with certain persons connected with the company, by which the petitioner obtained security for his debt, and was willing to abandon his petition. The petition was allowed to be withdrawn, with costs.

AT a meeting of the Aeronautical Institute and Club, held on the 2nd inst., Mr. Auguste E. Gaudron read the second part of his paper on the "History of Navigable Ballooning," which was entirely devoted to the experiments of M. Santos Dumont with his various balloons. The lecturer, who is a professional aeronaut of many years' experience, was of opinion that if M. Dumont had taken for his initial basis of construction the advanced stage of improvement in design attained by Messrs. Renard and Krebs fifteen years previously, he could have done with No. 1 what he accomplished with his No. 6 balloon.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, MAY 17, 1902.

[No. 167.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON Monday further evidence of the enthusiasm with which leading public men regard automobilism will be evidenced at Bexhill, and the refusals of accommodation at the leading hotels have been quite a record number. As a gathering of rank and fashion the "meet" promises to vie with the scene at many of the fashionable Grand Stands, and the presence of some of the principal Continental cars should be sufficient to cause records to be made on the new track.

The contests will commence at 1 p.m. on Whit Monday, so that visitors from a distance will have to start from home at an early hour if they intend to see all the trials.

A Bad Road.

MOTORISTS are always glad to hear of roads to avoid, and hence we give publicity to the neglected condition of the Lea Bridge Road between Lea Bridge and the tramway terminus. This road is the great and only highway for motorists to Epping and the Forest generally from Hackney, Islington, and North London. The state of the road is described as a disgrace to the Leyton Council and the Lea Bridge Tramway Company. We hope it is not quite so bad as a newspaper correspondent suggests, but the matter should be considered by the authorities concerned.]

The Dashwood Climb.

ELSEWHERE we publish a complete account of the Dashwood Hill competitions on Saturday last, with a cheerily written record of the journey there and back. The accompanying photographs have more than ordinary interest, for they testify to the interest which the Leader of the House of Commons feels in automobilism.

Suspension of a Competitor.

THE stern attitude of the Automobile Club with regard to the competitor who, on Saturday last, infringed its rules during the Trials on Dashwood Hill will be upheld by all who are interested in developing automobilism as a sport as well as a serious business undertaking. Mr. Grahame White was—as will be seen from our report on another page—disqualified for an infringement of the rule as to speed down hill; and we now learn officially from the Automobile Club that, "as a mark of disapprobation and as a warning, this car (a 28-h.p. Mors) and its driver are suspended from the Competition Register of this Club, and the car may not be run, and Mr. Montagu Grahame White may not drive, in any motor competition in this country until after June 30th next," unless he denies the accuracy of the report, in which case he will be heard by the Committee of the Club. This is the first occasion on which the Club has resorted to such a

course, and we hope it will have a salutary effect on those who disregard the feelings of their fellow-automobilists. To infringe the regulations in the presence of the Right Hon. A. J. Balfour and others, who from their public positions are seeking to remove legislative restrictions and administrative red tape, is an offence which the Club could not possibly condone.

Next Year's Show.

LITTLE has to be added to our recent references to next year's International Automobile Exhibition at the Agricultural Hall in March, save that the interest in the stands to let still continues, and, despite the efforts to induce the trade to hold back, energetic and enterprising firms are booking space in special positions. Evidently some who hold back will be disappointed when they find, after weeks of waiting, that the best positions have practically all been taken.

Street-Cleansing.

THE experience of the Kensington Borough Council is conclusive so far as the economy of motor dust and water vans is concerned. The Council has had one in operation since last December, working as a watering-cart by day and a street-cleaner by night. Mr. Weaver, the Borough Engineer, is so satisfied with the results, that on his recommendation the Council has decided to order another machine from the Thornycroft Steam Wagon Company, at a cost of £725. With two, he says, none of the present night horses will be required, and as watering machines during the day each motor will do more work than three one-horse water vans. The two machines will cost about £500 a year, compared with over £1,300, the annual cost of nine horses and men.

Regulations at Cardiff.

THE Head Constable of Cardiff has issued some regulations with regard to the street traffic of that busy town which might be usefully enforced in other districts. In issuing these regulations, Mr. W. McKenzie, the Chief Constable, says:—"Drivers of heavy carts are frequently to be seen at such a distance from their vehicles as not to have due control over the horses drawing the same. This is an extremely dangerous practice, and one that must be rigidly put down; every case coming under the notice of the police must be reported, so that proceedings may be taken against the offender. The practice of leaving tradesmen's horses and carts unattended in the streets is also much too common, and the police must see that this dangerous habit is put a stop to. In some few instances drivers chain up one of the wheels of their vehicle, but this practice must not be recognised by the police, because, although it lessens the danger, the breach of the law is the same." Whilst congratulating Mr. McKenzie on his regulations with regard to horse-drawn traffic, we cannot endorse his views that horses do not take kindly to automobiles, and regret that he did not make clear that the painting of the owner's name and address on light locomotives only applies in the case of vehicles employed for business purposes.

The Aero Club.

SHORTLY after the balloon ascent of Messrs. Pollock and Wallace from the grounds of the Crystal Palace, as recorded in our last issue, a second and larger balloon of 45,000 cubic feet capacity, carrying Sir Vincent Barrington, Mr. F. H. Butler, and Mr. S. Spencer, made a journey. Owing to a heavy squall and delay in filling, it did not start until 5.30 p.m., when it rose rapidly to a height of 4,500 feet, and met with a strong wind and fall of snow. After travelling in an irregular course over Beckenham, Chislehurst, near Farningham, and over South Darenth, it was decided to descend owing to the wider reaches of the Thames being approached. On touching earth the balloon dragged its grapnel for a considerable distance, owing to the strong wind, over a large open field, but was finally brought to rest by some twenty men hauling at the trailing guide rope. Accurate barometric, thermometric, and hygrometric observations were taken by Mr. Butler's self-recording instruments. The distance travelled over earth was about sixteen miles, and the time taken up to letting drop the grapnel twenty-five minutes, making an average speed of about thirty-eight miles an hour. At its highest elevation the pace must have exceeded forty-five miles.

Portsmouth Automobile Run.

THE enthusiastic interest taken in motoring at Portsmouth is rapidly on the increase, and since the recent Exhibition in London dozens seem to have discarded their cycles to take up the more fascinating sport, and are nightly to be seen disappearing themselves along the excellent front. The recently inaugurated Portsmouth Automobile Club, of which, by the way, Earl Russell is an active vice-president, is now well established.

PORTSMOUTH MOTORISTS AT BISHOP'S WALTHAM.

On Saturday last quite a large muster of automobiles of all descriptions turned out for the second run since the Club's formation, when the picturesque country around Bishop's Waltham was visited. The run proved exceedingly enjoyable, the party, after regaling themselves at the "Crown" Hotel, Bishop's Waltham, returning home through Winchester, Botley and Titchfield.

Glasgow to Bexhill.

COUNCILLOR H. Brooke and Mr. Bradney Williams, of the Bexhill Motor Co., have had a capital run from Glasgow to Bexhill on a 8-h.p. Argyll car, which is to be utilised on the south coast. Starting from Glasgow, they made good time to

Shap Fell, the descent of which—a distance of fourteen miles—was negotiated in partial darkness and in a drizzling rain. Reaching Kendal, the wayfarers rested the night, having covered 140 miles in a net running time of nine hours five minutes. The next day Warwick was reached, the net running time having been 175 miles in 12 hours 20 minutes. Rain delayed the start on

the third day, and towards evening the way was frequently ^{lost,} delaying the arrival at Bexhill till one o'clock in the ^{morning.} In sixteen hours, including 3 hours 20 minutes for ^{stoppages,} 177 miles had been covered. Thus the average speed for the whole of the journey was 15.4 miles per hour—a *satisfactory* tribute to the good workmanship now being put into the manufacture of automobiles.

Motor-Vehicles for Trade Purposes.

IT is a needless commonplace to remark of the greater readiness with which the advantages of the motor have been recognised on the Continent than has been the case in this country; but perhaps sufficient stress has not been laid on its wide adoption there for business purposes. It is true that as regards what is generally understood as heavy traffic we may console ourselves with being fairly abreast of European competition, at least as far as motor building is concerned; but as regards light goods conveyance, we can lay no such flattering unction to our souls. The wide adoption, for instance, of light vehicles, from the humble quad transformed to parcels carrier to the one-ton van in Paris, finds no parallel in London, where the few light motors used seem to be largely adopted as a mere advertising medium. The problems involved are not so widely different from those offered by the ordinary light passenger vehicle, while they differ considerably from those questions of heavy traffic which several English firms have so ably set themselves to solve; and perhaps our backwardness therein is more due to the apathy and conservatism of the British tradesman than to any other reason. Still, we are aware of at least one instance in which a deputation from a firm requiring light and fast goods vehicles of small capacity were disappointed at the want of provision for their needs apparent at the Show, and the question is one that should have the attention of makers, as in cases like this, supply must, to a certain extent, precede demand.

A Narrow Escape.

MR. CHARLES FRANKLIN left Newbury for Bristol at 1 a.m. a few mornings ago, after vainly trying, with the aid of a kindly policeman, for an hour to obtain a bed. He wended his way towards Bristol upon his 2½-h.p. motor cycle. All went well until reaching Savernake Forest, when the machine dashed into a huge gate across the road, forcing it open, the impact throwing Mr. Franklin and his cycle to the ground. Like lightning, the gate rebounded, and, striking him on the side of his head and cutting his ear, rendered him partially insensible. There he lay until daybreak, when he picked up his machine, traversed about half-a-mile, and arrived at a sheep-house, in which were some straw and sacks, he settled down until 8.30, when he crossed a field to Folly Farm, and through the kindness of the tenant, who drove him to the Marlborough Railway Station, he was enabled to reach his destination by rail. He believes that the speed of the machine, forcing the latch of the gate, saved him from a terrible accident, and probably sudden death. It is a common occurrence for cyclists, strangers on that road, to collide with this gate at night, and if the gate cannot be done away with, danger signal lights ought to be attached to the same at night when closed, warning approaching cyclists and others of its presence.

The Leather Trade.

COMMENTING on the recent Motor Car Exhibition at the Agricultural Hall, the *Leather Trades' Review* says:—It is obvious that the subject is of very direct interest to the leather trade inasmuch as quite a large section of it is devoted to the production of harness and saddlery, and the question arises as to what is to be the probable effect upon our industry. Possibly the day is a long way off when the harness maker will go out of business, but he is bound to be seriously affected by the popularity of the automobile, and it would be folly for the leather trade as a whole to shut its eyes to the probable changes

likely to be brought about by the gradual displacement of horse-propelled traffic. Fortunately, the increasing use of the motor does not necessarily mean the extinction of the leather trade as applied to locomotion. Leather in some form or other seems indispensable to many industries, and the automobile seems no exception to the rule. In the first place a certain amount of driving belts are required, although we gather from our inspection this is rather a small item. More important seemed to be the large quantity of our staple consumed in the upholstery and fittings of the vehicles. The demand for this grade of material is in excess of the supply, and some of our neighbours across the Channel have orders booked ahead for some time to come. From enquiries at the Show we were certainly tempted to believe the initiative in catering for the requirements of the automobile industry could not be placed to the credit side of British account. We always hesitate to accept without discount the statements of importers of foreign goods, but we were assured the samples of motor leather clothing, at any rate, were, without exception, of Continental make, or cut from skins tanned and dressed on the Continent." Our contemporary concludes with an earnest appeal to the British leather trade to be up and doing.

Motor-Cars for Syria and Palestine.

The United States Consul at Beirut reports that enquiries about automobiles are being made in Syria. Only one specimen, an inferior second-hand French machine, has been seen in Beirut; but it is thought that in Syria and Palestine, with their lack of railways and street cars, and with their rapidly developing carriage-road systems, motor-cars would do well. A new road is now being built between Sidon and Beirut, and will soon replace the ancient bridle path. While this road will be level, others throughout the region are steep and have numerous sharp turns. Vehicles in use, therefore, must be strong and durable. The country is poor, and, except possibly for the accommodation of tourists, there would not at present be much demand for automobiles outside of Beirut. The tourist traffic in Syria has more than doubled during the last ten years. At present about 750 foreign tourists pass through Beirut annually, most of them proceeding to Baalbek and Damascus. Twice this number go through Palestine. Galilee is also growing in favour among tourists. The figures given do not include pilgrims, thousands of whom seek the holy places, nor the special excursions which have lately come into vogue.

An American Endurance Contest.

A 100 mile endurance contest, held on the 26th ult by the Long Island Automobile Club, brought forward no less than eighty-two entries, of which sixty-six actually started. Although the start had been arranged for 10 a.m., the majority of the vehicles were somewhat tardy in arriving, and as the space provided for the cars was rather small with respect to the large number of entries, more or less confusion existed. No fixed order was followed in starting, the start being given to the vehicles in the order in which they presented themselves. A Panhard-Levassor of high horse power, having rushed over the 100-mile course in less than three hours, was the first to arrive back. Things went along slowly enough for a time until a Darracq came in, something like three hours ahead of the minimum time limit. Fifteen miles an hour, the Club had decreed, was to be the maximum speed, while all cars were ordered, on penalty of disqualification, to pass through controls at a speed not greater than eight miles an hour. A short time after others of the large cars began to arrive, and so far ahead of the schedule were they that there was no official of the Club on hand to receive them and make an official entry of their time. Of the sixty-six starters thirteen were disqualified for excessive speed, while fourteen did not complete. In the hill-climbing contest on Roslyn Hill a Locomobile won in Class A, steam, its time being 1min. 42sec. An Autocar won in Class C, making a time of 2min. 30sec. A Winton touring car won in Class D, in 1min. 42sec., and a Rochet-Schneider in Class E,

climbing the hill in the best time, 1min. 19sec., and winning two cups, one as winner in its class and one for making the best time of any vehicle.

The Dismissal of Cases.

It would appear that reason is beginning to prevail on the Bench, and this week we report two or three interesting cases of alleged furious driving where the magistrates declined to convict. One was at Haywards Heath, where the witnesses for the defendant were able to convince the Bench that no conviction should be made, and a second instance was at Dartford. In the latter case the police alleged that a motor-car was being driven at a rate of over twenty miles an hour, but, despite their elaborate calculations with a watch, the case was dismissed—conclusive evidence to the contrary being given by the passengers on the car.

MR. S. F. EDGE ON HIS 50-H.P. NAPIER.
Photo by [Mr C. Bailey.]

The Duty of the Police.

Mr. S. STOREY, ex-M.P., has just been re-elected chairman of the Durham County Council, and in the course of his speech in returning thanks he said that it had been the policy, and a mistaken idea of the police in that county for years past, that when they took a case to court it was incumbent upon them to win the case or else they got into discredit. He added that that was not the business of the police at all. They were public servants appointed to sustain justice. Their business was not, when they took a case to court, to win by hook or by crook, but to put all the evidence forward and see that justice was done. The business of the police and of those who acted for the police was not to strain any case against any man, but to present whatever they had which would enable them to take a just view of the whole of the circumstances. The Standing Joint Committee was about to appoint a new Chief Constable for that county, and he hoped before the appointment was made that the committee would lay down such regulations on that point as would secure a better state of things in the future.

Roads.

PRACTICAL work is being done by the Roads Improvement Association. It is now endeavouring to obtain precise information regarding certain roadways in the country, and will be glad of the assistance of motorists in obtaining the knowledge desired. Those readers willing to survey twenty or more miles of any of the roads mentioned below are invited to correspond with the hon. secretary at 45, Parliament Street, S.W. The roads in question are from London to Cardiff via Oxford and Gloucester; London to Dover via Canterbury;

Warrington to Carlisle; Manchester to Derby; York to Berwick via Newcastle; Bristol to Penzance via Exeter; Birmingham to Lincoln via Nottingham.

THE BEXHILL TRIALS.

CONSIDERABLE interest is being shown in the trials which are to be held at Bexhill on Monday next. Since we outlined the programme in our last issue several alterations have been made. Notably, the start of the trials in the Tourist Section has been changed to one o'clock, and those in the Speed Section to two o'clock.

Mr. Charles Cordingley has offered a 25-guinea cup as a first prize in Class A in the Tourist Section, viz., for tourist cars weighing over 25 cwt. There will be three prizes in this section, viz.:—First, Mr. Cordingley's cup; second, the United Motor Industries prize, value £12 12s.; third, Messrs. G. S. Scudder and Co.'s prize, value £9.

It should be noted that no vehicle can take part in the races unless it has been weighed. The opportunities given for weighing are as follows:—At the London and North-Western Company's Goods Depot weighbridge, Seagrave Road, West Brompton Station, London, on Friday, May 16th, from 3 p.m. to 7 p.m. At the West Marina Station weighbridge at St. Leonard's-on-Sea, on Saturday, May 17th, from 4 to 7 p.m. At the West Marina Station weighbridge, on Monday, May 19th, from 10 a.m. to 12 noon. There are several routes to Bexhill-on-Sea. A pretty one is via Godstone, East Grinstead, and Uckfield. In many parts the road is winding, and special care should be taken in approaching Bexhill, as the corners are dangerous.

The following is a list of entries up to the time of going to press:—

TOURIST SECTION.

Class F II.—MOTOR BICYCLES weighing not more than 112 lbs.

No.	Make.	Brake h.p.	Rider.
13	Werner	2	E. H. Arnott.
23	Humber	2	Bert Yates.
29	Werner	2	— Buquet.

Class E.—LIGHT VOITURETTES.

Cars weighing less than 10 cwt., with seats for four persons.

Cars weighing less than 9 cwt., with seats for three persons.

Cars weighing less than 8 cwt., with seats for two persons.

No.	Make.	Brake h.p.	Driver.
1	De Dion	4½	J. M. Gorham.
28	Century Tandem	5	R. W. Leader.
30	Baby Peugeot	5	C. Friswell.

Class C.—LIGHT CARS.

Cars weighing less than 18 cwt., with seats for four passengers.

Cars weighing less than 16 cwt., with seats for three persons.

Cars weighing less than 14 cwt., with seats for two persons.

No.	Make.	Brake h.p.	Driver.
14	10 h.p. Panhard	12	Roger H. Fuller.
16	7 h.p. Panhard	9	Chas. Jarrott.
22	7 h.p. Panhard	—	H. R. Langrishe.
26	12 h.p. Gladiator	10	C. K. Gregson.
27	8 h.p. M.M.C.	8	Geo. Iden.
35	12 h.p. New Orleans	12	Wm. Exe.

Class B.—Cars weighing 18 cwt. or more, but less than 25 cwt., with seats for four passengers.

No.	Make.	Brake h.p.	Driver.
2	16 h.p. Napier	24	S. F. Edge.
21	6 h.p. Daimler	7	Ernest Pitman.
25	12 h.p. Panhard	16	Yves Le Coadon.
33	10 h.p. Mors	12	H. T. Edwards.

Class A.—Cars weighing 25 cwt. or more, with seats for four passengers.

No.	Make.	Brake h.p.	Driver.
5	16 h.p. Napier	24-25	Edwin Midgley.
9	16 h.p. Panhard	20	H. Strakosch.
10	50 h.p. Napier	65	W. G. H. Brannan.
11	16 h.p. Daimler	18	Arthur Wood.
12	24 h.p. Daimler	26	Hon. John Scott Montagu, M.P.
32	24 h.p. Mors	28	M. Grahame White.

SPEED SECTION.

Class D.—MOTOR BICYCLES weighing over 112 lbs.

No.	Make.	Brake h.p.	Rider.
4	—	2½	E. H. Arnott.
24	Humber, chain driven	2½ h.p.	Bert Yates.
31	2½ h.p. Norfolk	2½ h.p.	S. F. Norfolk.

Class D1.—RACING MOTOR-CYCLES having more than two wheels, and weighing over 2 cwt., but under 250 kilos.

No.	Make.	Brake h.p.	Rider.
20	8 h.p. De Dion Tricycle	8	Victor Lee.

Class B.—LIGHT RACING CARS. Vehicles under 650 kilos.

No.	Make.	Brake h.p.	Driver.
19	16 h.p. Panhard	20	Chas. Jarrott.
34	8 h.p. Clement	9½	D. M. Weigel.

Class S.—Vehicles weighing more than 650, but less than 800 kilos.

No.	Make.	Brake h.p.	Driver.
15	10 h.p. Panhard	12	Chas. Jarrott.
17	16 h.p. Panhard	20	Harvey du Cros.

Class A.—Vehicles under 1,000 kilos.

No.	Make.	Brake h.p.	Driver.
7	40 Cannstatt Daimler	40	Campbell Muir.
8	40 Cannstatt Daimler	40	Baron Henri de Rothschild.
18	40 h.p. Panhard	40	Chas. Jarrott.

SPECIAL BIG RACERS' CLASS.—Vehicles over 1,000 kilos.

COMPETITION FOR CARS HAVING THE BEST APPEARANCE.

No.	Entered by	Description.
2	S. F. Edge	16 h.p. Napier.
7	Alfred C. Harmsworth	40 h.p. Mercedes.
9	H. Strakosch	16 h.p. Panhard.
11	Walter Crombie	16 h.p. Daimler.
14	Roger H. Fuller	10 h.p. Panhard.
25	A. G. Schiff	12 h.p. Panhard.
50	L. Savory	12 h.p. Gladiator.
51	Dr. Horner Wyeth	7 h.p. Noe-Boyer.
52	Nevill Copland	8 h.p. De Dion.
53	Alfred C. Harmsworth	20 h.p. Panhard.
54	W. F. Sewell	9 h.p. Daimler.
55	W. J. Peall	12 h.p. Daimler.

Altogether there are more than seventy entries, the last received being a 30-h.p. Wolsley car. Chevalier de Knyff will drive the 40-h.p. Panhard that has just taken part in the "Circuit du Nord." The Hon. C. S. Rolls has entered a 60-h.p. Mors, and also a 40-h.p. car of the same type. The "Easter Egg" will be driven by Mr. A. L. Creyke. This, it will be remembered, was on view at the recent Exhibition. Mr. C. Cordingley's 12-h.p. M.M.C. has been entered in the Tourist Section. We understand that M. L. Serpollet will make an attempt to beat his recent kilometre record, so that some phenomenal speeds may be anticipated.

MESSRS. DURHAM, CHURCHILL AND Co., of Sheffield, have removed their London office to 106, Great Portland Street, W.

MR. PERRY KEENE has been summoned at the Salisbury Petty Sessions for refusing to stop when desired by a person in charge of a horse. Mr. Staplee Firth defended, and the case was dismissed.

WE hear that a marriage has been arranged between Mr. Mark Mayhew, L.C.C., Vice-Chairman of the A.C.G.B.I., and Miss Dora Christine Fisher, youngest daughter of the late Mr. Luke Fisher, M.D., of Lytham.

THE action, the General Automobile Agency v. Waller, reported on another page, was concluded on Wednesday. The Agency sued Mrs. Waller for £500, but Mr. Justice Jelf accepting the lady's pleas, gave judgment in her favour, and ordered the return of the £100 deposit.

MR. AKERS-DOUGLAS, the First Commissioner of Works, received a deputation of cyclists and automobilists on Wednesday on the subject of the facilities granted to them for riding in Hyde Park. The concession asked for was that cyclists might be allowed to use the roads in Hyde Park with no other restrictions than those imposed on the ordinary traffic. Mr. Akers-Douglas, in reply, promised that he would without delay place their views before the Ranger, and ask for his favourable consideration to their request. Motor-cycles, taken under the care of the Hon. John Scott-Montagu, were assured fairer treatment, Mr. Akers-Douglas admitting that it was not fair to exclude them from the parks while motor-cars and ordinary cycles were admitted.

FROM SHOE LANE TO DASHWOOD HILL.

THERE were four of us—Three Men on a Car, to say nothing of the Driver—and we decided to have a day together in the open air. A week's sojourn at the Agricultural Hall, and a fortnight's groping in the candle light to seek the inspiration necessary to write columns descriptive of the great Exhibition, had jaded our spirits and wearied our brains. We wanted a reviver—and where is the restorer of good spirits that can compare with a breezy trip on a motor-car that has been well broken in (not necessarily broken down) and that can elude police and annihilate distance with the swiftness of a bird? As

GETTING READY FOR THE HILL CLIMB.

[Mr. T. B. Percy.]

the Automobile Club was holding a hill climbing competition on Dashwood Hill last Saturday, the proposition was moved, seconded, and duly supported, that we should accompany the string of vehicles that intended to join in the Consumption Trials. One of our number did not appreciate the idea of hill climbing, but the allurements of the Consumption Trials—which he regarded as rather a good thing—settled his mind, and with unanimity we agreed to the proposition.

It was carried into execution on Saturday last. Not "a bright May morning," nor did it have the warmth associated with Spring. Had a little more sallowness been infused into the atmosphere it would have been a good imitation of a November day. But the only settled thing about the English climate is its glorious uncertainty, and when the snow lay an inch deep in Buxton, we need not have been surprised to find the air chilly in London, even in the merry month of May. As already remarked, there were three of us, to say nothing of the driver; our identity need not be disclosed beyond cataloguing the journalistic trio as the Fair One (a gentleman, as distinguished from a lady, be it duly noted), a Thin Man, and he of Robust Proportions, who, with the modesty becoming the official chronicler of the journey, sat to the rear of the Driver—a capital position when the wind makes frontal attacks. Like others who spend their days in town, we all have dormitories in the suburbs, and from three quarters of the Metropolitan Police radius we foregathered to seats on Mr. C. Cordingley's 12-h.p. M.M.C. car, which took up a position outside the *Journal* office in Shoe Lane. Two of us having boarded the vehicle, a start was made for Victoria, where the Thin Man was to be picked up. Into Ludgate Circus we descended with muffled throats and looks of determination. For there was a chilliness in the air which not even the cheery greeting of Mr. A. Burgess, the secretary of the Motor Manufacturing Company, who was, in his capacity of a pedestrian, making use of the footway, could dispel. As we sped along the Embankment, a mist arose from the waters of the Thames, and there was a general aspect of spring cleaning about. The street orderly boys were tidying up; the mud-carts were dawdling along the roadway, and the pavements seemed scarcely aired. Overtaking an electrical cab whose driver

was inclined to "growl," after the manner of mere ordinary cabbies, we got within the shadow of Big Ben, and rounding into Parliament Square left timbers cumbering the ground on the Abbey lawns, and Colonial Agents settling down to routine duties in Victoria Street.

Now, it had been ordained by the Automobile Club and those who steer its course, that an official start should be made from the Belgravia Garage, South Eaton Place; and it was our intention, when the full complement of passengers was obtained, to fall in line with the vehicles as they were sent on their way. But, alas! the Thin Man was not to be seen outside Victoria; the only evidence of motor matters was a 6-h.p. Daimler opposite the Grosvenor Hotel. From its driver we learned three things. Firstly, that it belonged to Mr. Oliver Stanton, who has sold the Black Cat which was wont to purr so innocently along unfrequented roadways; secondly, that the Thin Man had arrived; thirdly, that, joining forces, the two early birds had sallied forth to catch the worm, which, being interpreted, means they were looking for the garage. A little later they returned—with no garage but with plenty of provender, which we duly plundered. But where were the motorists? We played every variant of note of which a horn is capable, from a long plaintive bleating, as of a lamb in distress, to the defiant shriek of a factory hooter, and having waited half an hour, and being assailed by other motorists vainly looking for their fellows, we set our faces westward and took a series of runs through Eaton Square and the locality, asking butcher boys, postmen, and municipal employees if they had seen a cavalcade of automobiles. But civility in answers of negation was our only reward.

So we decided to follow our inclination instead of the cars. Mr. Stanton, however, with the instinct of the expert, scented a car in the distance, and, keeping close up to the legal limit, bore upon it, to find Mr. Manville on board. He followed the vehicle—so we afterwards learned—some distance, only to discover that Mr. Manville was not going Buckinghamshire way. So he ceased to follow, and led his own vehicle to the right path that leads to High Wycombe. Passing into Hyde Park, we overtook the Royal postillions, who were rehearsing several splendid four-in-hands for the Coronation procession, and noted the dignity

MR. BALFOUR WATCHING THE TRIALS.

with which the horses ridden by ladies affected indifference to our presence. We would have preferred the excitement of having to jump from our car and capture a prancing steed, receiving a pleasant "Thank you" as reward; but, no, those horses calmly pursued their path. Taking liberties with Alexander Selkirk's confession, we might have said:—

"They are so well accustomed to cars,
Their tameness is shocking to us."

The Fair One likes not the poetry; but the Thin Man thinks well of the underlying idea.

And then the road lay almost along the course of the new Tube railway into Shepherd's Bush, where the electric trams took up the parable—I mean the roadway—as far as Southall. Thus far we had only sighted ordinary beasts of burden and commonplace tramcars; not a motor-car hove in sight until we halted at Hillingdon, a pretty little village this side of Uxbridge. A glance at the church and a ramble in an old-fashioned hostelry occupied but a few minutes; still, it sufficed for quite a dozen cars to whiz by, to the delight of a trio of canine observers whose antics reminded one of the famous collie encountered by Sir Henry Thompson in the High Street of Watford. Remounting our car, which had been travelling delightfully, we gaily careered through Uxbridge, the bustle of Middlesex was left behind, and we were in the quiet county of Penn. of Hampden, and Milton—a county which has preserved its agricultural aspect almost unaltered since the days when Cavalier and Roundhead crossed swords on its old-world village greens.

The main road to Oxford is a pleasant succession of views of well-wooded parks and grassy meadows, and were time not

announces the approach of a vehicle that knows its own mind and goes straight forward. But the force of such incidents soon pales on the motorist as he gazes upon the succession of undulating fields that lead the way to Beaconsfield, which has a fine wide main street, one portion of which seems for the nonce to be given up to some remnants of an old English fair. Right under the splendid Perpendicular tower of the church, in the churchyard of which lie the remains of Edmund Burke, a group of donkeys stood awaiting the attention of the village youths, and braying in extraordinary asinine fashion as we passed. After that the road descended upon the river Wye, a diminutive, gentle stream that breaks forth into something approaching a roar at the weir, just before Loudwater is reached. Then into Wycombe Marsh the road passes between houses and cottages until High Wycombe with its wide street and ancient market place, is reached.

Now it must be understood that automobile competitions on distant hills are not an appetising business. Last year we learned wisdom, for Dashwood Hill is not a place overrunning with comforting morsels, and those who are not adequately provided come empty away. So we decided to lunch in the town, and while the car was at rest we took a stroll and tried to recall some scenes of Venice by the stream that runs along Queen Square, where the little bridges across the water have a quaintness all their own. By this time a few cars were coming along—some numbered after the manner desired by a few County Councils; others unknown, unnumbered, and unsung. A few straggling motor-cyclists passed by, and after lunch we set forth again, refreshed and ready for the fray.

A short sharp spin took us to West Wycombe, a little place that owes much to Francis Dashwood, Lord le Despencer, whose name is still remembered on Dashwood Hill, where, at the thirty-third milestone from London, we found a number of automobiles and a goodly company of motorists. The site chosen was a capital one, providing ample room for the vehicles that were started on their trials.

Arrived at Dashwood Hill, the Mystery of the Start was soon discovered. The venue had been altered a few hours before the morning of the day, and instead of South Eaton Place, the run was from the new garage of the Hon. C. S. Rolls at Lillie Hall, Earl's Court, where Mr. Burrows, who is now attached to the Club Secretary's staff, superintended arrangements. The result was the confusion that prevailed at the original place, and it might be well in future to adhere to programmes, or at least acquaint everybody of alterations of plans. Competitors and observers were informed by telegram or messenger, and, although instructions were given, no news of the alteration came the way of the Press, judging from our own experience. At the foot of the hill many representative motorists were present. Colonel Holden, Mr. Worby Beaumont, and Mr. Staplee Firth—the latter only once perceived taking a "refresher"—were superintending the supply of petrol to the contestants, and must have become well proficient in the art ere the close of the day. One of our photographs shows Colonel Holden mounted on a car, with Mr. Beaumont filling up the tank, Mr. Lyons Sampson being an interested spectator. Snapshottists were almost as numerous as motorists—all complaining of the dull light and cool weather. Still, the scene was full of incident and interest as the Thin Man and the Fair One marched to the top of the hill, there to survey the scene from the vantage ground of an elevated position. The task of sending the cars on their way was no easy one. Standing behind a table were Messrs. C. Johnson and H. J. Swindley, the latter armed with a watch, and the former having nothing more formidable than a telephone. This was part of the electrical timing device which had been arranged, and the constant "Are you there?" seemed strangely out of place. But its utility was demonstrated. Mr. R. E. Phillips, with his new Rochet-Schneider car, and Mr. F. T. Bidlake were at the other end of the wire, which was laid by the side of the road, and constant communication was kept up during the day.

Dashwood Hill is fairly familiar to those who love ascending

MR. BALFOUR AT LUNCH.

[Mr. C. Friswell.]

pressing a day or two could be excellently spent in the old churches and manor houses that lie only a mile or two from the well-beaten track. Two miles beyond Uxbridge is Denham, with its fine Elizabethan mansion that once gave refuge to Charles II.; and then, heeding not the bye roads to places of historical interest, we made for Gerrard's Cross, from whence the pedestrian can find an easy way to Stoke Poges, where Gray sleeps beneath "the yew tree's shade," or to Jordans, made memorable by its association with the founder of Pennsylvania. The Romanesque village church of Gerrard's Cross has a great dome of most un-English appearance; but our chats on such matters were cut short by the action of a silly woman who crossed the road in a fashion most peculiar. For she grew nervous at the approach of the car, and came rushing wildly towards us at full tilt. It was only when the brake was applied that she had the sense to divert her steps to the footpath. Had she been knocked down in her nervous rush at the car we might have been hauled up for woman-slaughter, and now be pining in durance vile. And all because people will not use a little common sense, and leave the roadway with celerity when the sound of the horn

steep inclines and travelling comfortably by car where it is wearying to the feet. The hill begins at the thirty-third milestone, and the competitions on Saturday ended at a distance of 1,173 yards from the bottom. The average ascent is one in 14.3, and includes 352 yards of 1 in 10.9. Very remarkable was the ease with which most of the cars went up the hill, and several romped up in grand style. It was allowable to stop the engine at the top of the hill, and make the descent by gravity. Then to turn the car at the bottom, restart the engine, and repeat the ascent. The performance had to be repeated seven times—in accordance with the regulations published in last

'A "REFRESHER."

week's *Journal*, the fuel to be drained from the tanks into measuring vessels at the conclusion of the trial. Thus the kindly officials were kept at their post during five or six hours—a devotion to the details of organisation that speaks well for their enthusiasm in the cause of automobilism.

Those members of the public who attended seemed to take only a transient interest in the event, and few there were who stayed long. Probably the business reminded them too much of the Duke of York, who—

" had two thousand men ;
He marched them up the hill, and marched them down again."

Evidently some of the drivers, and many of the observers felt that the experience palled after awhile. In "The Light that Failed" Rudyard Kipling—himself a motorist, be it remembered—tells how Dick Helder discovered that with a limited income sausages and mashed potatoes were the best food, and meditated in this wise :—"Now sausages once or twice a week for breakfast are not unpleasant. As lunch, even with mashed potatoes, they become monotonous. As dinner they are impertinent. At the end of three days Dick loathed sausages, and, going forth, pawned his watch to revel on sheep's head." Similarly, two or three trips up Dashwood Hill were tolerable, but at the fourth some drivers felt inclined to utter monosyllables; at the fifth ascent they could have revolted and flown away from telephones and stop-watches; at the seventh try they did retire, shaking the dust of the place from their rear wheels in a perfect frenzy of relief. Mr. A. J. Balfour came along—on the Hon. J. Scott-Montagu's car—and divided his attention between a plate of cold beef and the passing cars. Having no Opposition to watch, he seemed to hugely enjoy his *al fresco* entertainment, and regarded the performances of some of the vehicles as really remarkable. After the Rev. Arundel Wharton had trusted himself on Mr. Alfred Harmsworth's 40-h.p. Mercedes, and returned safely, the Leader of the House of Commons took a seat by Mr. Campbell Muir, and,

bending to the breeze, journeyed up Dashwood Hill in 1 min. 13 secs. Fortunately no police had been engaged for the event, or we might have seen one of the Chief of Lawmakers summoned for breaking the laws he has helped to form. It might have been uncomfortable for Mr. Balfour; but it would have been a good thing for the industry. Who is the leader of opinion—he it in Society or in politics—who will become a martyr for the cause? Then Mr. Scott Montagu ascended the hill with Mr. Muir, and, whether the driver felt his responsibility less or not I do not know, but this I can say—he beat Mr. Balfour's time by two seconds. The road conditions were not of the best, for, although the surface was dry, it was very loose. Some of the motor-bicyclists found the ascent somewhat trying, and a few had to finish on foot, their general demeanour indicating a weariness of the flesh as well as vexation of spirit. Towards the middle of the afternoon I made the ascent of the hill on the 12-h.p. M.M.C. car, and found that many motoring enthusiasts were lingering by the wayside, one interesting little group consisting of Messrs. W. J. Peall, E. W. Peall, Percy Richardson, G. F. Pedley, Banks, and my two colleagues, who had chosen the higher part, and were surveying the scene with the patience associated with those who have had tyre troubles—and surmounted them. Once on the top, we passed through the avenue of trees to a secluded and level piece of road, where we decided to make a record between milestone and milestone. With a flying start the car got into a fine swing, and, nothing heeding, was at the second milestone ere the minute hands had made its second revolution; as to the precise time I am discreet enough to be silent. But as to the scenery I saw little; the trees appeared to leap with the agility of kangaroos, and my eyes ran copious tears. One man on the pathway seemed inclined to hold converse, but ere I could offer a remark he was gone—a case of incivility that should be inquired into by our educational authorities. Returning to the hill we descended in dignified style, for we were on official ground. We were half-way down when a Gillet-Forest delivery van, which was ascending for the sixth time, jibbed, owing, it transpired, to the wearing of the leather of the clutch. The passengers dismounted and went to the head of the vehicle just as though it had been an ordinary horse-drawn conveyance. Without warning the car commenced to run back, and it seemed as though an accident was inevitable, when the driver, with a presence of mind that should secure him a diploma for nerve, steered the vehicle into the hedge—nearly running down a couple of photographers and smashing their instruments—where it came to a stop. Neither the

AT THE STARTING POINT OF THE HILL CLIMB.
[Photo by] (Mr. C. Friessell.)

driver nor the car was hurt; the incident was over in less time than it takes to relate, but it was exciting enough while it lasted.

Mr. Grahame White, who is well known as a dashing driver, with plenty of celerity in his movement, added a little zest to the proceedings by rushing up the hill at a terrific pace on a 24-h.p. Mors. The way in which he came down was even more alarming, for, slipping in his high speed, he simply rushed down the hill and round the curve at the bottom at a pace which must have

been a mile a minute. It might have been a brilliant exploit, but its wisdom was questionable.

Towards the end of the afternoon the number of motorists present visibly thinned, and our journalistic trio mounted our trusty car for the return. A halt was made for necessary lubrication at West Wycombe, and then, with plenty of dust in the rear, we made way to Beaconsfield, making another stop to visit the many scenes of historical interest there to be found. There is no railway station at this town of fine open aspect, and its hostelrys—the "White Hart" and the "Saracen's Head"—are well preserved, and ready to join in the revival that motoring will bring. In the olden days the Oxford coaches changed horses here while the passengers changed coin. Motorists should prove equally profitable to the innkeeper.

While at Beaconsfield a few motor-vehicles sped by, Mr. Grahame White alarming the natives of the place as he drove through on a car from which a part of the silencer was missing. A series of sharp loud reports as though a battery was indulging in field practice startled everybody, and from every doorway peered anxious faces wondering why motorists should disturb the quietness of the scene. We, on our part, were in no hurry to return, so the journey home was made *via* Windsor. Leaving the town we turned into the Slough road. We found plenty of interest,

they proved to be Messrs. Banks and Coles taking advantage of the opportunity to study the gear-box—truly an interesting sight. Expressing the hope that they would profit by their lesson, we next came upon an awkward little hill with a deep descent and a nasty turn at the end—just the sort of pathway along which to send a friend out of a spirit of revenge. Regretfully leaving the road to Burnham Beeches, the way was made across Farnham Common to Farnham Royal, so called from the fact that the manor used to be held in return for the supply of a glove for the king's right hand at the Coronation. Away into Windsor, and thence *via* Staines to town. Most of the vehicles were back in Lillie Hall shortly after tea, and there the process of emptying tanks was again carried out.

Below are the results of the trials as officially declared, and, although they are subject to correction after reference of special points to the honorary observers, they are not likely to be substantially affected by subsequent analysis. In connection with this table Trial A is the non-stop run from Lillie Hall, S.W., to the foot of Dashwood Hill, about thirty-three miles; Trial B the return journey over the same course *via* High Wycombe, Beaconsfield, and Uxbridge; and Trial C is the average speed up Dashwood Hill, arrived at by taking a mean of the time records of seven ascents.

for the scenery was typical of that harmony of colour that makes the English landscape so delightful. Through some trees we just descried the way to the Hall Barn, where the poet Waller lived for many years, and a few yards farther came upon something less ancient. Standing in the road was a Brown motor-car, and two protruding forms were seen. On getting nearer

GREAT expectations were formed amongst the natives of Ceylon recently when it was rumoured that a motor-car was to become part of the equipment of one of the estates in the Lunugala district. It is owned by Mr. Stanley Green, and when it arrived hundreds of natives and estate coolies crowded to see the vehicle.

CONTINENTAL NOTES.

By "AUTOMAN."

THE month of May, 1902, will always be regarded in the annals of automobilism as a red-letter month, for it inaugurated a step with regard to motoring which has come about so noiselessly that we hardly stop to realise the importance of it. France has given more than its official sanction to high speeds on the open roads, for a department of its Government, namely, the Ministry of Agriculture, is actually the promoter and organiser of a road race, where not only is the highest possible speed encouraged, but a premium offered for the winner.

THE DE DIETRICH CAR READY TO START FROM NICE ON THE RETURN JOURNEY.

Second Class :

1. De Dion-Bouton, 8-h.p., 17 litres, 720.
2. Darracq, 6-h.p., 24 litres, 200.
3. Ader, 7-h.p., 24 litres, 500.

Third Class :

1. Bardon, 5-h.p., 7 litres, 790.¹
2. Georges Richard, 8-h.p., 11 litres, 500.
2. La Societe Nancieene, 11 litres, 400.

The results, however, show that the classification has not been good. It will be remembered by the readers of the *Journal* that there were three classes, namely, first, cars carrying less than 100 kilos (1 cwt. 2 qrs. 2 lbs.), secondly, cars carrying between 100 kilos and 500 kilos (9 cwt. 3 qrs. 10 lbs.), and, thirdly, cars carrying

THE DE DIETRICH CAR MET AT PARIS BY THE OCTROI AUTHORITIES.

THE CANNSTATT-DAIMLER LORRY AT VALENCE.

THE PEUGEOT BROUGHAM AT MARSEILLES.

THE RECENT FRENCH HEAVY MOTOR-CAR TRIALS.

[Le Chauffeur.]

THE opening of the "Circuit du Nord" took place at Beauvais on Saturday morning last, when at six o'clock twenty-one heavy traction vehicles left the Bertin Garage on the consumption trial of eighty-five kilometres, which is the distance which separates Beauvais and Paris—about fifty-two English miles. Out of a total of twenty-three entries, there were twenty-one starters, and out of the twenty-one starters only one failed, and this was a 7-h.p. Peugeot, which failed solely on account of tyre troubles. The day was fine but cold, and the roads as a rule were in good condition, though there was a certain amount of skidding by some of the heavily loaded vehicles. The following were the results, arranged in the order of the results according to the consumption per ton of useful load :—

more than 500 kilos. In the first category there were no entries at all, in the second there were only four entries, the rest of the entries being of the third class. It is noticeable as a result of the competition that the light cars are by far the most economical in the consumption of petrol per useful ton of load, and this result seems remarkable at first sight, and will be a problem for the future. It may, however, be accounted for in a great measure in the pneumatic tyres of the lighter vehicles.

WHILST these lines are in the printers' hands, the tourist and speed contest will be taking place, and the duel between Panhard and Mors will have been once more decided. There is not much change as far as the *chauffeurs* are concerned, and the names

of those in the speed trial are almost identical with the starters for the Paris-Berlin last year's race, with the exception that the Mercedes stable is not represented at all. The Hon. C. S. Rolls and Mr. C. Jarrott are the only Englishmen in the race, and all the cars are of French make, save two, which come from the workshops of M. H. P. Dechamps, the indefatigable Belgian. I notice that Gabriel, who was so successful for Darracq at Nice, has gone over to Mors.

I CALLED at the Mors Works a few days ago, and M. Huillier was kind enough to show me round and point out the improvements that have been incorporated in the 1903 model which makes its appearance for the first time in the Circuit du Nord. The steering gear is absolutely irreversible, no amount of shock on the wheels making any impression on the hand of the conductor. Another point of great interest is the ingenious device for easing the springs, and avoiding the jolts of a bad road. All those who are used to high speeds on the road know the sensation of passing over an inequality therein. The springs are compressed and released so quickly that the wheels bounce and rebound. In the new Mors cars the springs are fitted on pneumatic dash pots in such a manner that this jerk is entirely done away with, and, in M. Huillier's own graphic words, stick to the ground like glue. What struck me most is that these new racing cars have ceased to be the monsters of last year.

THE *Commission Sportif* are to be congratulated on the wise resolution they adopted last year, when they inaugurated the 1,000 kilo limit. This new rule has changed the efforts of the manufacturers of motor-cars from a competition in which brute force was the object to one in which science and intelligence alone will triumph.

THE "Passe-partout" has arrived safely in Paris, but has not yet gone off on its journey north-west. It is remaining in Paris for some little time in order to have certain alterations made.

AMONGST the ranks of automobilists in France there are a great many painters, and so it is that the A.C.F. has organised a picture exhibition in the Salle des Fêtes. The paintings are all by members of the Club, and are well worth a visit, although there is nothing especially connected with automobiles as the subject of these works of art. The motor-car has hardly got so far as that. Probably next year we shall see something in that direction.

SOME few weeks ago I mentioned in these columns the question of the magneto sparking arrangements with regard to weight of vehicle in competitions. According to racing rules, accumulators for electric ignition were not taken account of in the weight of vehicle, whilst the magnetos in the magneto electric arrangement were weighed with the car. This was obviously unjust, and I am glad to see that the following new rules have been added to the racing list by the *Commission Sportif*. (1) Cars which have a mechanical contrivance driven by a motor and with which the necessary power is produced for ignition purposes shall have 7 kilos (15 lbs. 6 ozs.) weight allowance. (2) The weight of lamps and horns shall not be counted, but only the brackets for carrying the lamps. (3) Records made where there are turns and in which time allowances have been made for the turns shall not be recognised at all.

ON Monday morning M. Severo decided to take a trial of his air-ship, which I described to the readers of the *Journal* some little time back. He started shortly after five o'clock in the morning from his balloon shed at Vaugiraud, his wife being there to see him off. Just before mounting into the car with his *mecanicien*, M. Suchet, he handed his wife his purse, saying to her: "I shall not want it up in the air, and you had better take care of it," and the balloon was loosed and mounted to about 400 metres, going against the wind towards the E.N.E. It went over the goods

station of Montparnasse, and on in the direction of Vincennes. When just over the Avenue du Maine the spectators noticed that something was wrong, and M. Lachambre, the well-known balloon maker, affirms that he saw fire. The air-ship deviated in its course towards the left, as if the intention was to turn back home, and immediately after, to the horror of the spectators, an explosion occurred, and the whole envelope burst into flame, whilst the solid part of the frame and car, with the motors, M. Severo, and the *mecanicien* made one plunge towards the earth in a vertical direction. The unfortunate occupants were both thrown out and smashed on the pavement of the Avenue du Maine. This sad tragedy occurred at 5.40 a.m., as M. Severo's watch bears witness, for the shock stopped it. The consensus of opinion of expert spectators is that the aerostat rose too quickly on account of the sudden expansion of the hydrogen, due to the sun's rays, and that the hydrogen, escaping through the automatic valve, gathered between the balloon and the car, and was ignited by the exhaust from the motor, and, being already mixed with air, produced an explosion which immediately ruptured the balloon, and set the whole airship in a blaze. This view is strengthened by the fact that the centre of the explosion, judging from the wreckage, was near the motors, and the body of the *mecanicien*, who was by the motors, was charred out of all recognition, whilst the body of Mr. Severo, who was in the front of the car, showed no marks of burns whatever.

IN our last issue we mentioned that a few days ago Osmont, the professional motor-cyclist, covered a mile, with a flying start, on a De Dion motor-tricycle, in the record time of 56.1.5 sec.,

beating the old record by 3.5 sec. Our illustration, from *La Vie au Grand Air*, shows the intrepid rider enjoying a cigarette just prior to his record ride.

THE awards in the recent heavy-weight trials between Paris and Nice, organised by our contemporary, *La France Automobile*, are announced as follows:—2nd Category, A, 12-seated omnibuses.—1st prize, De Dietrich (No. 5); 2nd prize, De Dietrich (No. 6); B, hurries carrying over one ton.—1st prize, Daimler lorry (No. 8). 3rd Category.—A, 8-seated omnibuses.—1st prize, Peugeot (No. 13); B, delivery vans carrying at least 500 kilos.—1st prize, Gillet-Forest (No. 10). In addition the driver of each vehicle which arrived at Nice will receive a bronze medal from the French Automobile Club. We reproduce on page 232 several snapshots taken during the trials.

Mechanical Flight Up-to-Date.*

BY SIDNEY H. HOLLANDS.

CHAPTER VII.—continued from page 168.

THE subdivision and arrangement in tiers of sustaining surfaces has proved highly advantageous in Mr. Hargrave's "cellular kites," previously referred to. It may be added that in these the detachment into groups of "cells"—the two or more groups separated some distance longitudinally—has given a remarkable degree of aerial stability to the structure. To quote Mr. Hargrave's own words: "One thing about these cellular kites is worth special mention, *they are perfectly stable and certain in their action*, and need no careful adjustment." Referring to an ascent on a series of his large cellular kites (Fig. 6) Mr. Hargrave says further:—

"As few experimenters can afford to lay a rail-track of sufficient length to properly try a flying machine I thought it would be well-spent time if I not only devised but made and went

FIG. 8.—LILIENTHAL'S "DOUBLE-DECKER." (151 sq. ft. of Surface.)

FIG. 9.—CHANUTE'S "DOUBLE-DECKER." (134 sq. ft. of Surface.)

up on a series of kites that could be converted into a flying machine by adding a motor. Or the kites to be merely used as a means of safely lifting a flying machine from the ground, trying it, and, if it flew, slipping the moorings, as it were, and flying free. And finally picking up the kite line and descending without risk. . . .

. . . I provided myself with four kites (of an aggregate weight of 34½ lbs. and an aggregate lifting surface of 232 square feet). . . . They were toggled on to the same line" (at distances of about 48 feet; a sheave-block tackle, which was anchored to a spring-balance on the ground, was used for hauling in and paying out line). . . .

* All rights reserved.

"The sling seat was then toggled on and I got aboard with a hand anemometer and a clinometer, the lot were then pulling 180 lbs. I found the velocity of the wind to be 18.6 miles per hour when it raised me; the wind fell lighter and I came down. However, a long and strong gust eventually came and sent me up like a rocket.

"A careful reading showed the wind velocity to be 21 miles per hour with 240 lbs. pull on the spring-balance. The weight aloft was a total of 208 lbs.

"I think this experiment marks an epoch in my work. Although the altitude attained was nothing to speak of, the conditions would be identical if the kites had been held by a mile of piano wire instead of the clothes line used.

FIG. 10.—CHANUTE'S MULTI-WING MACHINE.

FIG. 11.—WRIGHT'S "DOUBLE-DECKER." (308 sq. ft. of Surface.)

"The particular steps gained are: that an extremely simple and compact apparatus can be made, carried about, and flown by one man, and that a safe means of making an ascent with a flying machine, of trying the same without any risk of accident, and descending, is now at the service of any experimenter who wishes to use it."

An experimental aerial machine made by Mr. Horatio Phillips in 1893 (Fig. 12) depended *solely* for sustentation on multi-superposed slats, or very narrow aerocurves. These were very long and closely spaced, being 22 feet long by only 1½ ins.

wide, and spaced $2\frac{3}{4}$ ins. *immediately* above each other; the frame in which they were set, each at an angle of 15 degs., was 20 feet wide and 9 feet high. The structure closely resembled a colossal Venetian blind more than anything else. This was erected on a low triangular three-wheeled under carriage or truck, which also carried a small rotative steam motor and boiler (loco. type), developing about 8 h.p. and driving a 6-ft. fan-propeller (set in front of the slat frame) at about 600 revolutions

devoid of stability. It will be obvious that a *stepped* system of *semi*-superposed surfaces, such as I described earlier herein (Fig. 7), does provide considerable parachutic surface in addition to its other advantages.

Some of the late Dr. Lilienthal's highly instructive sailing-flight experiments were conducted with duplex-superposed surfaces, or "double-deckers" (Fig. 8), as also were those of the late Percy S. Pilcher in England, and of Messrs. Chanute, Herring,

FIG. 12.—PHILLIPS' AERIAL MACHINE.

per minute. The machine ran on a circular track of about 50 feet diameter around a central post, to a swivel on which it was linked or tied by wire guys.

The propeller thus drove, or rather pulled, the machine around the track at an estimated speed of 25 miles an hour. At this speed when tried, and *when facing the wind* (through about one-third of the circle) it rose about two feet clear

FIG. 13.—LAMSON'S FIRST TYPE OF "AIR-SHIP." (Superposed Planes.)

of the track. The aggregate area of slat surface or aerocurves (Fig. 1) was 137.5 square feet, and the total load lifted was 402 lbs.

This trial was interesting as an experiment in aero-dynamics, but of course the machine was not of a type in the least adapted for a practicable aviator. One very essential feature was conspicuous by its absence, viz., surface for parachutic action, a provision for safe descent, besides which the machine was quite

FIG. 14.—LAMSON'S "AIR-SCHOONER," WITH DUMMY PASSENGER.

and Wright (respectively) in America (Figs. 9, 10, and 11). The latter, the brothers Wilbur and Orville Wright, of Dayton, Ohio, are the most recent experimenters in this branch of flight and have made some bold departures, both in methods and in type of soaring machine, from all precedent, but, fortunately, so far successfully. Well, daring, combined with discretion and an adequate knowledge of aerial phenomena, are just the qualities wanted for this work, and may they continue to have every success. Mr. C. H. Lamson, another American, in 1896 made and tried some large models (superposed), but without motors (see Figs. 13 and 14).

(To be continued.)

Mr. G. H. Bechtel, of Southport, has been appointed manager of the Road Carrying Company's light car department. Communications for him should be addressed to the offices, 7, Victoria Street, Liverpool.

THE Albion Motor-Car Company, Limited, have just completed two Albion cars to carry six persons for shipment to Singapore, where they have had a car running for a considerable time with successful results.

THE disused Wesleyan Chapel on the Springfield road, Chelmsford, has been acquired by Mr. G. Taylor for motor-car works and shops. Mr. Taylor will devote himself entirely to the sale and repair of motor-cars.

THE Electric Ignition Company have lately introduced a renewable wet battery for motor-cycles and cars. It consists of two twin cells giving four to five volts, and, as the name implies, has the advantage of being renewable when exhausted.

THE Jackson Duplicate Tyre Syndicate, Limited, has been registered with a capital of £2,000, to carry on the general business of cycle manufacturers and dealers, indiarubber tyre manufacturers, carriage and motor-car builders, etc. The registered office is at 5, Crouch Hill, London, N.

IMPROVEMENTS IN PETROL MOTORS

WE illustrate this week two small attachments to an internal combustion engine invented by Messrs. E. F. Bradley and W. R. Pidgeon, which they have found to be of great service. One is a small spring attachment placed on the induction-valve, which keeps the valve just off its seat except during compression. It consists of a strong spring *A*, pressing down on a plug *B*, which has a very limited travel, and which itself presses on top of the valve-spindle *C*, as shown to the right of the drawing. The amount the valve is held open by this spring is adjusted by the gland *D* and lock-nut *E* to about one-hundredth of an inch, and the strength of the spring *A* is made amply sufficient to overcome the stickiness of a greasy valve seat, but not enough to resist the compression. Thus when the engine is turned round slowly, at starting, for instance, there is no back pressure, but as soon as the piston moves quickly the pressure

closes the valve, and the engine works in the ordinary way, except that the valve opens more readily, and so admits a larger charge, thereby slightly increasing the power of the engine. The valves, moreover, seldom need cleaning, and will even, if necessary, work with common benzoline. The use of this spring also renders unnecessary the application of an exhaust-valve lifter.

The other attachment is shown to the left of the drawing, and consists of a small valve inserted in the air-pipe, between the carburettor and the induction-valves. This valve opens to the air, and is closed by a light spring, and is so proportioned that at slow speeds it remains shut, but as the engine speeds up it begins to work, and continues to open wider and wider as the speed, and therefore the suck on the air, increases. Messrs. Bradley and Pidgeon have found, by experiment, that the jet of the carburettor must be larger for low speeds than for high ones to get the maximum power out of the engine at any particular number of revolutions per minute, and as it is difficult to adjust so small a thing as the hole in the jet, they put on the snifting-valve, mentioned above, which automatically keeps the mixture approximately correct for all speeds. At starting, the jet being large, the supply of petrol is also large, and the engine starts readily, then, as it speeds up, the snifting-valve comes into action, and automatically lets in more and more pure air as the speed increases, thus keeping the mixture correct, and the power of the engine at its maximum for all speeds. When both attachments are put on to an engine, its power is claimed to be increased, and it is much more easy to start. It can also be almost pulled up on a hill without stopping, and when allowed to, picks up more strongly. Back-fires also do not occur, provided the charge is ignited electrically; indeed, the supply can be slowly throttled between the snifting-valve and induction-valves, until entirely shut off, without causing a back-fire. The drawing also shows

one of Messrs. Bradley and Pidgeon's improved springs (*F*) on the induction-valve, which renders nuts or stops on the valve stem unnecessary.

THE NEW ROOTS AND VENABLES HEAVY OIL CAR.

MESSRS. Roots and Venable have lately introduced several improvements in their two-seated heavy oil car. The accompanying illustration gives a general view of the latest model, which is, it will be noticed, fitted with inclined wheel steering in place of the old tiller. The engine, which uses ordinary petroleum as fuel, is located about the centre of the frame. It is of the horizontal type having a cylinder $4\frac{1}{2}$ in. in diameter by $5\frac{1}{2}$ in. stroke and developing $3\frac{1}{2}$ h.p. at a speed of 750 revolutions per minute. The water circulation is maintained by means of a pump and a special radiator consisting of a number of coils of copper tubing, mounted so as to surround the fly-wheel of the motor, advantage in this way being taken of the cooling effect produced by the air set in motion by the flywheel. In addition a radiator is mounted between the front wheels. Tube ignition is adopted, the vaporiser and the ignition tube being heated, at starting, by a blow lamp for about five minutes. The vaporiser consists of a gunmetal cylinder, in the centre of which is arranged the admission tube. A part of the air drawn in by the engine enters through a side tube and circulates round spiral passages in the walls of the cylinder, after which it emerges in a heated condition into the intake pipe. Here it catches up and sprays paraffin oil, which is delivered into its path at periodical intervals by a reciprocating plunger reciprocating between the intake passage and a recess filled with oil. The oil, sprayed and vaporised by the intruding heated air, is carried in through the induction valve, additional air for combustion being supplied by a valve situated in the rear end of the cylinder. The engine is fitted with a governor, which automatically acts on the reciprocating oil-delivering mechanism so as to cut off the supply while the governor is in action.

By means of a lever operated by a button near the driver's seat the speed of the engine can be reduced down to 400 revolutions, so as to limit vibration and noise when for short periods the car is stationary. Coming now to the transmission, two speeds are provided. The power is conveyed from the engine shaft to the rear axle through two friction clutches and two chains, intermediate speeds being obtained by putting the clutches in such a position as to allow a little slip. When fully engaged the two drives provide for speeds of the car of five to fifteen miles an hour, with the engine running at a normal speed. One of the drawbacks to heavy oil cars has hitherto been the unpleasant odour they give off. The makers claim that with their latest engine, the combustion is so complete that they make no more smell, although using heavy oil, than petroleum spirit motors. In fact, they state that if smoke is made either by their heavy oil motor, or by a petrol motor, it is due in each case to excess of lubricating oil in the crank chamber.

THE Motor-Car Exhibition at the Agricultural Hall.

FOURTH NOTICE.

SCENE AT THE AGRICULTURAL HALL.

PROBABLY no display in the Exhibition attracted more attention than did that of the Daimler Motor Company, Limited. So extensive has been the booking for their new types of cars that, in order to keep faith with customers in the matter of deliveries, the company were compelled to partially sacrifice the comprehensive collection of carriages originally arranged for. Notwithstanding, the company's exhibit was exceedingly interesting, particularly from an engineering point of view, illustrating as it did the great advantages of the new over the old types of cars. Apart from this, the fact that there was also shown, in an incomplete condition, the magnificent 22-h.p. carriage of the 1902 type, designed and built to the order of the King, and of which we published an illustration in our issue of the 26th ult., rendered the stand attractive to visitors. The *chassis* is similar to the standard type described, with the difference that its wheel base is 9 ft. The body is exceptionally roomy, and gives accommodation for eight passengers—two on the front seat, and six in the back of the car. The two rear seats of the *tonneau* are provided with rounded-back rests, and the occupants are completely protected from dust by curved glass panels, reaching to the top of the canopy which covers the carriage. This canopy is also provided with side curtains, as well as a glass panel above the door which gives access to the rear part of the carriage. The car is painted crimson-lake lined red, and is to be luxuriously upholstered with blue morocco leather. The wheels are of equal size, and are fitted with Goodyear pneumatic tyres. Another handsome carriage was the 22-h.p. *tonneau* built to the order of the Earl of Craven. The body is painted ivory-white with crimson lining, and is upholstered with red morocco leather. It is fitted with a new type Daimler motor, and is provided with four forward and reverse speeds. The equal-sized wheels (36 in.) are shod with 4½ in. Michelin Clipper pneumatic tyres. A 22-h.p. *chassis* was

also staged, likewise one of the 12-h.p. cars, at the side of which was a 12-h.p. *chassis* of the old type, in order that comparison might be made between the two. We do not propose to deal at length with the new models, as a lengthy description, with illustrations, was given in our issue of February 22nd last. A few details of the new 12-h.p. Daimler may, however, be of interest. With regard to the engine, this comprises two cylinders, the cam-shaft, with its valve motion, being entirely encased. The cylinders are cast in one piece with the heads, thus avoiding any water joint. The governor is fitted on one end of the cam-shaft, and it acts on to two throttle-valves, placed immediately above the induction-valves. Both electrical ignition and tube ignition are provided for in a particularly convenient manner. A single block carries the ignition tube and the electric ignition plug. The commutator is placed upon the dashboard of the car, so as to be easily accessible. The float-feed carburettor has a deep float to permit any sediment or foreign matter to fall to the bottom below the suction outlet; the carburettor is also, it may be noted, fitted with a water-jacket which can be supplied with hot water from the cylinder jacket. Other features of this vehicle are the automatic lubricator, which supplies the motor with the exact quantity of the oil required, and the facility with which the valves can be removed. The water-tank is now situated immediately below the radiator in front of the car, thus shortening the water connections very considerably. The radiator is built up of small flanged pipes set into aluminium chambers at each end. The friction-clutch has a single conical surface, instead of the double concentric device formerly employed. The change-speed gear is exceedingly compact, and is now arranged behind the countershaft instead of in front. It is fitted in an aluminium casing, which encloses the first motion shaft, the second shaft with its sliding wheels, the differential gear, and the bearings for the countershaft. The motor is carried in an angle steel frame, which is separate from

and suspended below the main frame itself. The main frame is built up of wood strengthened by steel plates. The different speeds are operated by a single lever which is securely held in a central position in a special quadrant, and which, after being moved either to the right or the left, can be moved forward or backward, thus giving four positions. The brakes on the rear wheels are applied through a compensating device which consists of a swinging beam, whose centre is connected with the operating pedal, and whose ends are each connected with one side brake-strap. Ring lubrication is employed for the countershaft bearings. The advance made was strikingly demonstrated on the stand by means of an old 12-h.p. placed side by side with a new type *chassis* of the same power. The former weighs 25 cwt., and the latter 15 cwt.—a saving of 10 cwt., without any loss of strength or stability. On the motor alone a saving in weight of $1\frac{1}{2}$ cwt. has been effected, while the difference between the two frames is even more pronounced, for a reduction of $8\frac{1}{2}$ cwt. has here been secured, and yet to the untechnical visitor it was evident that, in many respects, the new carriage is stronger than the old one. Of even more interest is the new 22-h.p. Daimler (Fig. 106). All four road-wheels are 36 in. in diameter, of the artillery pattern, with steel axle-

FIG. 106.—THE DAIMLER 22 H.P. CAR.

boxes, and thickened spokes for the attachment of the sprocket-wheels. The motor itself develops 22-h.p. at 720 revolutions per minute, and the four forward speeds are actuated by a single lever. A second small lever on the footboard is connected with the reverse gear. The weight of the *chassis* is under 22 cwt. The wheel base is 7 ft. 6 in., and the gauge 4 ft. $7\frac{1}{2}$ in. Another interesting car was Mr. Oliver Stanton's 24-h.p., "Le Chat Noir," which has done excellent service throughout the country. The last of the complete carriages was of the 6-h.p. type, now practically abandoned by the company on account of the demand for high-power cars. In addition to the exhibit of cars, specimens of the three new types of motor were also shown. One of these was a 9-h.p. two-cylinder engine, developing 11-h.p. at 900 revolutions per minute, the cylinder diameter being 86 mm. and the stroke 100 mm. It is fitted with combined tube and electric ignition, and a neat centrifugal governor on the cam-shaft connected direct to the throttle-valve. The other two were four-cylinder motors, one giving 14-h.p. at 900 revolutions, and the other 22-h.p. at 720 revolutions. Another interesting exhibit was a specimen of the 1902 12-h.p. transmission gear, shown separately, which provides for three forward speeds and a reverse, actuated by a single lever, and is fitted with special self-oiling bearings. The company also exhibited various types of car-bodies, designed to utilise all the available space.

One of the most important exhibits in the show, and one which was continually surrounded by interested enquirers, was that of the Wolseley Tool and Motor Car Company, Limited, who had on view a 5-h.p. *chassis*, a 10-h.p. *chassis*, a couple of 10-h.p. wagonettes, one of which was fitted with solid rubber tyres, a 10-h.p. Siamese phaeton, a 10-h.p. special cab referred to below, a $7\frac{1}{2}$ -h.p. *tonneau*, a new type for the Wolseley Co., and a handsome 20-h.p. car built for the Earl of Warwick; the latter was a large double *tonneau* at the rear, seating four persons, all of whom face forward. The body of the Siamese phaeton is of special construction; the glass wind shield in front can be used either

with or without the canopy, it being particularly strongly fixed although it has no bar across and above the dash. The canopy is arranged so that it can be quickly removed by loosening two nuts. The 20-h.p. cab, of which we give an illustration in Fig. 110, is, as will be seen, of unique design, the driver's seat being placed centrally, as also is the steering pillar. The seat itself is sufficiently narrow to permit of doors being fitted at angles between it and the sides of the main body. The doors open on to the same platform as that on which the driver's seat is placed and long footboards replace the ordinary type of step. The top of the cab projects forward in a peak above the driver and gives an unusual appear-

FIG. 109.—THE WOLSELEY BAND BRAKE.

ance to the whole vehicle. The road wheels are fitted with New York tyres, and the body is painted black, relieved by a band of imitation cane work between the body proper and the top. The driver's seat being in the middle, with all the control levers brought up to the centre, both occupants of the cab have a clear view ahead. In the construction of the Wolseley cars the first aim of the designers has been to obtain the utmost simplicity, consistent with reliability and economical working. The 5-h.p. and 10-h.p.

cars were fully described in our report of the 1901 show, but we may mention that the engine is in all sizes, horizontal, with the crank-shaft parallel to the car axles. The ignition is electric, high tension, the current being supplied by accumulators. The carburettor is of the float feed spray type, and a throttle-valve in the mixture pipe controls the quantity of vapour passed to the explosion chambers; this, combined with the advance sparking device, controls the speed and power of the engine, no governor or cutting-out mechanism being required. A leather-faced friction clutch is mounted on the crank-shaft inside the fly-wheel, and the power is transmitted to the gear-box by a Renold silent chain. The speed-change mechanism is of the sliding gear type, and gives in the 5 and $7\frac{1}{2}$ h.p. sizes three speeds forward, and one reverse, and in the 10 and 20 h.p. sizes four speeds forward and one reverse, all changes in each case being made with one lever. The power is transmitted from the gear box, which also contains

petrol is contained in a tank under the bonnet, and is fed to the carburettor by gravity, sufficient spirit being carried to run the car about 150 miles, and in addition to this, if desired, a spare tank can be fitted, which holds about six gallons. The radiators for the cooling water form the sides of the bonnet, and are all above the engine, so that in case of failure of the pump the water will circulate by convection. The body and all the mechanism is mounted on a frame of channel steel, which is supported on the axles by four long semi-elliptical springs. Steering is locked, and is by an inclined wheel operating a worm and wheel mounted on the front axle, connection to the steering pillar being through universal couplings. The 5-h.p. cars are fitted with a single cylinder engine ($4\frac{1}{2}$ in. bore by 5 in. stroke), giving about 5.5 b.h.p. at a speed of 750 revolutions per minute. The 10-h.p. vehicles have a motor comprising two cylinders parallel ($4\frac{1}{2}$ in. bore by 5 in. stroke) giving about 11-b.h.p. at 750 revolutions

FIG. 110.—THE WOLSELEY 10-H.P. SPECIAL CAB.

the balance gear to the rear road wheels by two roller chains, thus keeping all possible dead weight off the tyres. In Figs. 107 and 108, are given an outline elevation and plan of the Wolseley cars, from which the general arrangement can easily be followed. Two independent brakes are fitted in all sizes: a countershaft double-acting band brake operated by a pedal, and a hand-applied rim brake acting on rims bolted to the felloes of the rear road wheels. The countershaft brake, which is illustrated in Fig. 109, is not connected up as is usual with the clutch, this arrangement having been adopted after careful trial, chiefly because it obviates all risk of the clutch mechanism fouling that of the brake, and preventing it working when much worn or partly fired. The drum on which the band presses is hollow, and is so made that water can be poured in at one side. A small separate tank may be fitted under the seat to supply the brake with water for very hilly districts, though it is not absolutely necessary if the driver uses the side brakes, instead of the foot brake, on all long descents. The

per minute, and running up to about 1,000 revolutions when accelerated. The 20-h.p. cars have a four cylinder engine ($4\frac{1}{2}$ in. bore by 5 in. stroke), giving about 21-b.h.p. Two cylinders are located in front of the crank shaft and two behind it. In this vehicle two clutches are used, one at each end of the crankshaft, both simultaneously operated by one pedal, and the driver is taken to the speed gear box by two Renold silent chain, one at each side. As already mentioned the $7\frac{1}{2}$ -h.p. car is a new size for the Wolseley Co.; it has been really introduced to meet the demand of those who desire a small car, but faster than the 5-h.p. The engine has two cylinders (4 in. bore by 4 in. stroke), placed parallel with balanced crank-shaft, giving about 8-b.h.p. at 900 revolutions per minute, and accelerating to about 1,200 revolutions when desired. The car is fitted with three speeds instead of four, but is in all particulars a reduced facsimile of the 10-h.p. As regards the general improvements in the details, we may first state that the hand throttle has been improved by the interpola-

tion of a diaphragm between the two throttle plates, so that there is no possibility, when it is moved, of one plate pulling the other with it, thus rendering the adjustment more positive and delicate. The springs have all been lengthened, and the second plate is turned over the shackle bolt, so that in passing over any very serious obstruction or depression the strain is not taken on the top plate only. An important modification is the adoption of a jaw clutch inside the sprocket wheel on the first motion shaft. This clutch is automatically thrown out of engagement when changing from one speed to another without any additional action on the part of the driver, the bulk of the strain which is put on the teeth of the gear wheels owing to the momentum of the clutch and the chain when they are being brought into play being thus removed. In the steering gear a larger worm with double thread than hitherto used, is now fitted. The radiator is also now stepped instead of having the tubes immediately above one another. Nearly all the bearings are lubricated from the dashboard, and only one kind of lubricating oil is used. The bearings not lubricated from the dashboard, such as the clutch, steering gear, contact breaker, and pump, are fitted with grease lubricators. Altogether the Wolseley cars deserve the appreciation they are receiving at the hands of motorists—an appreciation which is shown by the fact that the Company is stated to have orders on hand for over 400 cars. |

A new firm at the Agricultural Hall display is Messrs. Wilson and Pilcher, Limited, who showed a 8-h.p. tonneau (Fig.

FIG. 111.—THE WILSON AND PILCHER CAR.

111), remarkable for its quiet and easy running. The motor is of the 4-cylinder horizontal balanced type, the cylinders being arranged in pairs, one pair being located on each side of the crank shaft, which is in line with the transmission gear. The water circulation is maintained by radiator and pump; the water for cooling purposes is, however, carried above the engine, so that natural circulation can be employed in case of emergency. The ignition is electrical, with automatic timing device. A governor is provided, acting on the admission pipe; in connection with it is a pedal-actuated accelerator which enables the speed of the engine to be varied between 300 to 1,400 revolutions per minute. It will be noticed from Fig. 113 that the flywheel is so shaped that the rim overhangs the forward part of the engine, and the arms act as a fan to direct air on to the radiator. Provision is made by a small trap door on the footboard for easy access to the circulating pump and commutator, which are arranged on the left-hand side of the casing. Vibration is claimed to be practically eliminated by the perfect balance of the engine, which is suspended from the frame. This balance is obtained without the aid of any additional parts or joints. In transmitting power from the engine to the driving-wheels no chains or belts are employed, the car being gear-driven throughout. There are four speeds forward and a reverse, giving, with governor control, any speed from two and a half to thirty-five miles an hour. The power is transmitted from the engine shaft through a friction clutch longitudinal shaft and bevel gearing to the rear live axle, all parts being entirely cased in, as a glance at the plan view given in Fig. 112 will show. Two epicyclic reduc-

tion gears are fitted on the longitudinal shaft between the clutch and the bevel wheel on the rear. The change gear wheels are always in mesh, and are only running when actually required, wear and noise being thus reduced to a minimum. On the highest speed no gear wheels, excepting only the main bevel, are in motion. The speed change gear has the advantage of being

FIG. 112.—PLAN OF WILSON AND PILCHER CAR.

capable of being changed under full load, and without using the main clutch. The change gear is worked by friction-clutches of the direct-acting cone type, no toggles being employed; and these are so designed that the wear of the cone (which is very slight) does not affect the action of the change gear. Whether the speed-reducing gear is in or out of use, the pressure from the spring driving the cone home is never on a moving, and so a rubbing, face; this enables large springs to be employed without in any way affecting the efficiency of the transmission. The forward speeds are controlled by a handle conveniently placed to the driver's right hand, the four speeds being controlled by one lever. The reverse motion is operated by a lever placed on the footboard beside the steering pillar. As regards the general arrangement, the engine and gearing are quite separate from the car body; and they are so arranged that the bearings cannot be thrown out of line by the inequalities of the road. The method of lubrication is particularly effective, and, while freeing the dashboard and body of the car from all lubricators, ensures that a proper supply shall reach every bearing. Considerable economy, moreover, is

FIG. 113.—FRONT VIEW OF WILSON AND PILCHER CAR WITH BONNET REMOVED.

secured, as by this system of casing in the waste of oil is reduced to a minimum. Arrangements are also made so that it can be seen at a glance if the working parts are receiving their due amount of oil. A feature of the machine is the three-point suspension of the body on the driving mechanism, it being supported

on a pair of rear springs and at a single point above the engine. Inclined wheel steering is adopted, while the artillery wood wheels are 32 in. diameter at the front and 40 in. diameter at the rear, shod with pneumatic tires. A band brake on the hubs of the rear road wheels is worked by a hand lever which also disengages the clutch. There is also a band-brake on the differential gear, worked by a pedal. These brakes all act equally well either forwards or backwards. The car complete with water and petrol weighs about 18 cwt. In addition to the complete car, Messrs. Wilson and Pilcher had on view some useful improvements in connection with the details of petrol motors, notably a new commutator, a new induction valve, and a modified form of piston ring, which we hope to illustrate in an early issue.

We have already described some of the features of the Chatel-Jeannin cars (see *Motor-Car Journal*, March 1st, 1902), but an examination of the vehicles exhibited in the Gallery brought to light so many new points that a further reference to this interesting type of car may not be out of place. Two vehicles were displayed—a four-seated *tonneau* (Fig. 114) and a two-seated car with an attractive form of body, comprising two basket-work arm-chair seats. The frame is of tubular construction, large diameter tubes being used. Built in this at the rear is a horizontal motor of 7-h.p. (Fig. 115). The cylinder is 105mm. diameter by 105mm. stroke, the normal speed being 700 revolutions per minute.

FIG. 114.—THE CHATEL-JEANNIN TONNEAU.

Electrical ignition is fitted, the trembler being on the coil, and the make and break device on the engine running in oil. A Longuemare carburettor is employed to furnish the explosive mixture. The water circulation is on the thermo-syphon arrangement, the water being contained in the torpedo-pointed false bonnet in the fore part of the car. The engine has two fly-wheels, which, as also the differential change speed gear and the rear axle, are entirely enclosed in a double cylindro-conical gear-case, the rear end of which is provided with a detachable cover, which can be readily removed to give access to all the working parts. The gear-case also forms the bearings for the short engine shaft. The two fly-wheels are placed close together, with the connecting-rod head between. A novel feature is the fitting of the usual differential gear in the connecting-rod head instead of on the axle. Two speeds forward and a reverse motion are provided. The rear live axle is in two halves, the inner ends of which are provided with internally-toothed wheels, which mesh with small pinions on the exterior ends of the short engine-shaft set, the latter being located to the rear of the axle. On top speed the engine drives these half rear axles direct through its pinions, but the low speed and reverse are obtained by epicyclic gear brought into action by means of the tightening of spiral springs on the outer cases of the same. The forward speeds

are controlled by a lever, and the reverse by a pedal. The arrangement is exceedingly simple and compact, and, judging from a short run on one of the cars, it appears to work extremely well. Equally-sized artillery type road-wheels, inclined steering, hand and pedal controlled brakes, are other features of these interesting cars, of which more is likely to be heard in the near future.

FIG. 115.—REAR AXLE AND MOTOR OF CHATEL-JEANNIN CAR.

Madame Louis Lockert, of *Le Chauffeur*, the oldest automobile journal in France, is becoming a familiar and welcome visitor at these Shows. She brought an unique collection of caricatures of leading French automobilists, which have interest both from the artistic and motoring points of view.

The New Grappler pneumatic tyres were shown by the company bearing that name. The general features are so well known that detailed description is now unnecessary. With a view to prevent the tyres being used on vehicles heavier than those for which they were intended, the New Grappler tyres have now stamped on them the weight they will satisfactorily carry. Class A tyre will carry 120 lbs. per wheel when loaded, Class B 150 lbs., Class C 250 lbs., Class D 400 lbs., Class E 500 lbs., and Class G 1,200 lbs. per wheel when loaded. A 5-inch tyre for heavy cars was a special exhibit on the stand.

As usual, the Motor Manufacturing Company, Limited, had a varied and interesting display of their M.M.C. cars, ranging from 12-h.p. down to 7-h.p. To begin with the first-named, a *tonneau* to seat five, the body being tastefully finished in cream

FIG. 116.—REAR VIEW OF FRAME OF CHATEL-JEANNIN CAR.

with brown lines, the steering standard, brake-gear, reversing-rods, steering-rods, and starting-handle all being in brass, the vehicle, of which we give an illustration in Fig. 117, is fitted with a four-cylinder motor nominally rated at 12-h.p., but working up to 16-h.p. Both tube and electric ignition are provided, while the governor, in connection with which is a hand "accelerator,"

acts on the admission pipe. Four speeds forward and a reverse motion are provided, the transmission being on the usual lines—that is to say, through a friction-clutch to the gear box, the countershaft in the latter being connected by bevel-gearing to a differential cross shaft, from which the power is conveyed to the rear road wheels by means of two chains. The frame is low, and is mounted on equal-sized road-wheels, 32 in. in diameter, shod with pneumatic tyres. It is claimed that this car can attain a speed of forty miles an hour—a claim which was substantiated during a private trial we made on a vehicle of this type so recently as Saturday last. From the 12-h.p. cars we pass to the 10-h.p.—a new type, of which a *chassis*, as well as a complete *tonneau*, were shown. This vehicle is fitted with a two-cylinder engine, the normal speed of which is about 900 revolutions per minute. The two cylinders are each cast separately, without water-joint, and are mounted on a crank-chamber common to both cylinders. The cam-shaft is enclosed, and the contact breaker is placed on the dashboard, and is driven by a chain. A centrifugal governor on the front end of the cam-shaft actuates a throttle valve on the left-hand side of the engine. A Bowden wire is used for

in connection with the electrical ignition has been superseded by a fibre disc with brass contact piece let into it, against which the spring contact presses, and makes and breaks circuit with the sparking coil, on which the trembler is fitted. Three speeds forward and a reverse motion are available, the transmission being by means of a gear-box and two chains. In this car the change-gear is not of the sliding pinion type; the spur-wheels are always in mesh, any one pair being made to convey the power by means of a sliding feather. Across the end of the stand was staged the 8-h.p. two-cylinder car, which did so well in the recent non-stop trial between Glasgow and London, getting through with a total of no less than 974 marks out of a possible 1,000. Two double-cylinder 7-h.p. cars were also on view, both fitted with *tonneau* bodies, but as these have already been described in the *Journal* no lengthy reference is necessary on the present occasion. The industrial vehicle department was represented by a delivery-van fitted with a 7-h.p. double-cylinder motor, and intended to carry a load of one ton. This car is fitted with solid rubber tyres, and is well supplied with brakes, there being one on the countershaft, band-brakes on the rear wheel sprockets and

FIG. 117.—THE M.M.C. 12 H.P. CAR.

working the accelerator, and for advancing or retarding the ignition, the wires being actuated by levers on the top of the steering-column, above the hand-wheel. Both tube and electric ignition are employed, while the water-circulation is maintained by pump and radiators. The motor on this car is covered by an unusually light bonnet, made of aluminium. Lubrication to the cylinder and cranks is maintained by a sight-feed lubricator fixed to the dashboard. Three speeds forward and a reverse motion, controlled by a single lever, are provided. The clutch-shaft is, as usual, in line with the crank-shaft; the sliding wheels are mounted on the second motion-shaft, which is in the same horizontal plane, but on the right-hand side. The differential gear is also enclosed in the change gear-box. Two brakes are fitted, each acting independently of the other, and each automatically disconnecting the engine from the gear when they are applied. Passing a stage lower in horse-power, we come to the latest model of the M.M.C. voiturette, fitted with double phaeton body, finished in cream and brown, and provided with light leather-bound, wood-framed, collapsible twilled hood, upholstered in pigskin. The motive power in this car is provided by a single-cylinder engine, somewhat on De Dion lines, and developing 8-h.p., and located in the fore part of a tubular frame. The usual trembler

shoe-brakes on the tyres of the driving wheels. Three 8-h.p. single-cylinder engines and samples of carriage-wheels completed an interesting exhibit.

An imposing display of Milnes petrol pleasure-cars was made by Messrs. G. F. Milnes and Company—four large vehicles, all fitted with highly-finished *tonneau* bodies. Two were fitted with 12-h.p. motors, while a third had a four-cylinder 16-h.p. motor. In general arrangement these vehicles closely follow the lines of the Cannstatt-Daimlers. The novelty on the stand was the new 20-h.p. *tonneau*. The motive power is supplied by a four-cylinder engine located in the fore part of the frame under a bonnet, and fitted with Simms-Bosch magneto-electric ignition. The Cannstatt-Daimler type of combined water-tank and cooler is adopted. Four speeds forward and a reverse motion are provided, these being controlled by a single lever at the side of the driver. The power of the engine is conveyed through a pedal-actuated friction-clutch to the gear-box, which contains a train of sliding gears. The gear-box is connected by bevel pinions to the differential cross-shaft, which in turn transmits the power to the rear road-wheels by chain-gearing. Inclined wheel-steering is fitted, while there is a pedal-operated band-brake on the differential shaft and band-brakes on drums connected with the hubs

of the rear road-wheels, the latter being put in action by means of a hand-lever. The motor is fitted with a governor which acts on the admission and ignition simultaneously, there being also a hand accelerator fitted in connection therewith. The road-wheels

to the satisfaction of the Post Office authorities. It is designed to carry a load of 35 cwts. at a speed of 11 miles per hour. Of the 6-h.p. two-cylinder size two vehicles were shown—a covered lorry with solid rubber tyres, to carry 35 cwts., and a van, also

FIG. 118.—THE MILNES 16-H.P. TONNEAU.

are all the same size, while the noticeable feature of the car is its relatively long wheel base and low centre of gravity. On another stand Messrs. Milnes displayed four other heavy petrol lorries and waggons, chief amongst which was the Royal Mail van, fitted with 16-h.p. four-cylinder motor with Simms-Bosch magneto-

with solid rubber tyres, to carry 30 cwt. at a speed of 8 miles per hour. A lorry, with iron tyres, to carry up to 2½ tons, was also staged. As regards the chassis, this is identical with the van illustrated in Fig. 119, recently supplied to the Caledonian Railway for use in Glasgow. The vehicle is 17 ft. long by 5 ft. 3 in. wide.

FIG. 119.—THE MILNES 2½-TON PETROL MOTOR VAN.

ignition, and Cannstatt cooler, with induced draught. It is built to carry mails between Manchester and Liverpool, and is one of an order from the Motor Haulage Company for three vehicles. It has already been tested on the Mount Pleasant-Red Hill route

The wheelbase is 11 ft., and the floor space 11 ft. 6 in. by 5 ft. 6 in. The frame is constructed of U channel-steel, and will bear a total dead load up to 2½ tons. The motor comprises two cylinders, the diameter of the pistons being 105 mm. and the stroke 130 mm. The

number of revolutions per minute is 750, at which the engine develops 8-b.h.p. The power is transmitted from the main longitudinal shaft through the differential gear on the Cannstatt system, by means of two pinions engaging two internal gear-wheels fixed to the rear road-wheels. The speed-changing gear gives four speeds, viz., $1\frac{1}{2}$, $3\frac{1}{2}$, 6, and 8 miles per hour. The first and second and the third and fourth speeds are each controlled by one lever, by which means, as the two couples of speeds are independent of each other when changing, neither couple affects the other set of gear-wheels. The friction-cone is automatically disengaged when either speed-lever is actuated. The reverse-speed is obtained by dropping into gear a special cog-wheel, giving a speed of 4 miles per hour. Two circumferential brakes, worked by worm-gear from the driver's seat by hand, act on the hind wheels. There is also a double-acting brake-clutch on the first speed shaft, and a sprag on the back axle.

On Messrs. Milnes' heavy vehicle stand Mr. F. Stadler exhibited Williams' patent counter-skid, a device to prevent that

FIG. 120.—WILLIAMS COUNTER-SKID.

bugbear, sideslip. It consists of two hinged brackets (A and B, Fig. 120), working on the positive and negative principle, fixed one at each end of the back-axle of the car. At the bottom of each of the brackets there is a disc, or steel wheel, which runs loosely, carrying its own weight only. This disc has a sharp edge. The whole arrangement can be raised or lowered by a lever placed at the side of the driver. As to the operation of the device, let us suppose a vehicle which, having started on roads which were dry, is obliged to make its return journey on those which are wet and greasy. As soon as the driver gets into his seat, he lowers the counter-skid apparatus and goes forward. Directly the slightest tendency to side-slip occurs, the sharp edge of the disc is forced into the road; it engages instantly and automatically with the wood or macadam, as the case may be, and as it continues to revolve, the check on the car is infinitesimal. Moreover, the disc is so set with regard to the car, i.e., by a slight inward inclination, that, having performed its work, it at once disengages itself. To whichever side the car inclines to slip, the result is said to be the same; on the one side it is checked by the positive arm, on the other by the negative. The device can be made for all sizes of cars, the one exhibited being of a heavy type, and intended for use on a 5-ton lorry.

Two Hallamshire cars—7 h.p. and 14 h.p.—were shown by Messrs. Durham, Churchill and Company, who also staged a 7-h.p. chassis in order to permit the arrangement to be inspected. The 14-h.p. car is fitted with double phaeton body and the 7-h.p. with a tonneau. No portion is occupied by the mechanism of the car, the space under the front seat being fitted to carry petrol, etc., for long journeys. The body can be removed by slackening two screws. Simms motors are employed with magneto-ignition and timing gear, and admission regulator. The 7-h.p. motor is of the single-cylinder type, while the 14-h.p. is a twin-cylinder governed engine; in both cars the motor is located under a bonnet in the fore part of the frame. Two speeds forward and a

reverse motion are provided. The flywheel of the motor is adapted to receive a "Champion" clutch, actuated by a rocking lever from a pedal on the footboard. The clutch shaft, which is an extension of the motor-shaft, carries at its extreme end a spur wheel, gearing with a pinion on a parallel shaft which carries the change gear. The latter consists of a pair of clutches combined with an epicyclic gear, which gives the two speeds, and a further clutch gear which gives the reverse at either speed. From the change-gear shaft the power is conveyed by spur gearing to a differential countershaft, and thence, by means of a centrally-located Brampton chain, to the rear axle. A feature of the change gear is that it is so arranged that, on the high speed, the whole gear runs solid, thus reducing loss of power by friction, and wear and tear. Another point to which our attention was drawn is, that only one operation is necessary to change, stop or reverse. The frame is of a special compensating design, which is claimed to entirely prevent "racking" even on the roughest roads, and to ensure the driving gear being always in line; it is built up of channel steel and ash, with tubular radius rods. The wheels are of the artillery pattern shod with solid or pneumatic tyres. The steering is of the irreversible type, controlled in the 7-h.p. car by a horizontal hand wheel, and in the 14-h.p. by an inclined one. Messrs. Durham, Churchill and Company also showed a large range of their largely-used "Champion" clutches, including

FIG. 121.—SECTION OF THE "CHAMPION" FLY-WHEEL FRICTION CLUTCH.

adaptations in connection with belt pulleys, gear, and chain drives. They also showed a launch gear, in which two clutches are combined to give free engine, solid drive ahead, and drive astern through epicyclic gear contained in the forward clutch. Fig. 121 gives a section of the "Champion" fly wheel clutch. The outer cone *a*, which is bolted to the fly wheel, runs continuously with the motor; the inner cone *b* transmitting the power to the gear shaft. It is claimed for this clutch that it is self-adjusting for wear, and gives an instantaneous release. There is an absence of end thrust both when driving or when idle, while no screw or wedge action occurs when the clutch is in operation.

Several modifications have been introduced into the little car made by Messrs. Eastmead and Biggs, and which is now known as the "Velomobile," since we gave an illustrated description of it last autumn. Fig. 122 gives an outline illustration of the latest model, which is fitted with a tonneau body, the tonneau being

detachable, so converting the vehicle into a two-seated touring car with large luggage capacity. A feature of the design is the employment of two separate tubular frames; one which carries the body and is supported by springs on the front and rear axles in the usual manner, and another which carries the whole of the propelling mechanism, the latter being hinged to the body frame at its forward end, and pivoted to the rear axle at its rearward end in such a manner as to allow the axle perfect freedom to oscillate so as to accommodate itself to any irregularities of the road. Owing to the particular arrangement of the pivots, this oscillation

FIG. 122.—THE "VELOMOBILE" 8-H.P. CAR

can only take place in a vertical plane and co-axial with the transmission shaft, which passes through the pivots or trunnions on the gear box and the bearings in the running gear frame into which the trunnions fit. It is claimed that in this way the driving and braking strains which the outer casing of the rear axle has to resist are not imposed upon the springs or on the bolts by which they are attached to the axles, the trunnions themselves taking these strains and any others which may be set up. The motive power is supplied by a Simms 8-h.p. water-cooled vertical single motor, with Simms Bosch magneto ignition, and hand-operated throttle valve. The water circulation is maintained by a pump driven off the half-speed shaft. A single-cone clutch is now fitted, and the gear-box, which gives three forward speeds and a reverse motion, is controlled by handles on the steering column. The top speed is, as before, a direct through drive from the engine to the rear axle, thus avoiding the friction losses of any gearing when on the high speed, the connection between the gear-box and the rear axle being by means of a longitudinal shaft and worm gear. The clutch cone is fitted with a brake for facilitating the operation of changing from one speed to another. Two pedal-operated brakes are fitted—a coil brake on the rear axle and a double-acting one on the transmission shaft, which can be applied without disconnecting the clutch, and may, therefore, be used in conjunction with the throttle. On applying the rear axle brake the clutch is first released, and a brake brought into contact with the clutch cone. Steering is controlled by an inclined hand-wheel, while the road-wheels are of the cycle type, 30 in. in diameter. The wheel base has been lengthened to 6 ft. 6 in., which permits a roomy *tonneau* body to be fitted. A petrol tank, holding eight gallons, is carried behind the back cushion of the driver's seat; the motor-bonnet is hinged so as to be readily lifted clear of the engine, and the whole of the body can be removed after taking out half a dozen screws.

Considerable interest was shown during the week in the liquid fuel firing system for steam boilers displayed in action by the Hydroleum Company, Limited, by means of which all descriptions of liquid hydro-carbons, from petroleum to the various tars and tar refuse, can, it is claimed, be completely consumed without smoke or smell. The Hydroleum Company's devices, under which the system is carried into effect, comprise a feeder and a combustion chamber of novel construction, which can be applied to existing stationary, locomotive, or marine boilers and other furnaces as well as to steam motor-cars. The burner or feeder (Fig. 123) has two passages through it, one passage being connected with the oil supply and the other being a steam connection from the boiler or otherwise. The feeder is so constructed as to concentrate

the issuing products instead of, as heretofore, to spread the vapours too abruptly; the oil is only at atmospheric pressure, and the reservoir from which the feeder takes its supply is slightly lower than the outlet nozzle of the latter, thus preventing any flow of oil into the furnace when the feeder is not in action, and also allowing the feeder to suck its proper quantity of oil, no matter whether it be going fast or slow. The two passages through the feeder are arranged concentrically, the oil outlet being the central one and in advance of the steam one which surrounds it. This formation permits of a vacuum being formed in front of the oil orifice, which vacuum produces a "suck" of oil from the reservoir. The outflow of oil relatively to the volume of outcoming steam is regulated by a needle valve operating at the point of outlet. The issuing products are directed on to a dash-brick; but it is essential, in order to produce complete combustion, that the dash-brick should be of a certain size, and located in a certain position, and that between the feeder nozzle and the dash-brick there should be an enveloping constricted way or passage of refractory material, the area of which bears a certain proportion to the size of the feeder employed. By these means every particle of vapour is kept together until it fires on the dash-brick, which, owing to the concentration of the vapours at that point and its comparatively small area, rapidly becomes sufficiently heated to split up the vapour into its component gases, which, after leaving the brick, re-unite and give out heat in the main combustion chamber. No vapourisation of the oil occurs in the feeder, every particle of oil reaching the firing point. A feeder to generate steam in a 14-h.p. boiler is stated to consume from $1\frac{1}{2}$ to $2\frac{1}{2}$ gallons of heavy oil per hour. The Hydroleum water-tube boiler is claimed to comprise many advantageous features. The design admits of considerably increased surface in actual contact with the source of heat, thus giving a greater evaporative power. It is compact, and as there is very rapid circulation, the tubes can be of much smaller diameter than usual. The principal point of distinction, however, in the boiler is that the heat, instead of passing across the tubes, is made to run parallel with them. This is effected by enclosing the tubes within a flue of refractory material, running from the feeder to the point of exit. The boiler shown weighed only 70 lbs., and was capable of evaporating 20 gallons of water per hour. The Hydroleum steam engine is of simple design, there being no complicated parts, and all its working members are lubricated from one lubricator. It is of the three-cylinder single-acting type, but can be worked high-pressure or compound, the change being effected in a simple manner. The absence of internal friction is evidenced by the high rate of speed attainable, which can be anything from 100 to 3,000 revolutions per minute. The engine shown weighed only 30 lbs., and yet was capable of developing 4-b.h.p. when working as a compound motor. The Hydroleum system has given most satisfactory results in the way of economy in the case of a large stationary water-tube boiler. Whether the system can be successfully

FIG. 123.—THE "HYDROLEUM" BURNER.

applied to steam cars remains to be seen, and we shall watch any experiments in this connection with interest.

A capital display of aluminium motor-car accessories formed the feature of the display made by Messrs. Matterson, Huxley, and Watson, Limited, notably gear-cases, base-chambers, cooler-covers, silencer-covers, plates for contact-breakers, and sheets for panels. The firm also devote attention to phosphor bronze bushes and levers, gun metal brackets, float-chambers and covers, mild steel crank forgings, wrought and cast iron hardening pots, silver steel, etc.—a varied selection of which was shown at the Exhibition.

Messrs. Trier Brothers made a bold display of Stauffer's lubricant of "Tell Tale," and unbreakable Stauffer lubricators, check valve lubricators specially designed for service on automobiles, grease syringes, split grip collars for shafting, grindstone dressers, etc. In the check valve lubricator the reservoir, which is firmly locked and dust-proof, contains a piston, which is actuated by a spiral spring. A threaded piston-rod is screwed through this and projects below the reservoir, closing the exit in the shank like a valve. Thus the loss of lubricant, owing to vibration, is effectually prevented. The quantity of grease used can be efficiently regulated, and although the lubricator may be full it will not act until set for that purpose. The central screw lubricators introduced by Messrs. Trier Brothers are used for grease, an exact regulation of the supply being possible, the outlet hole being closed by a screw as soon as the requisite quantity has passed.

Tyres for motor-cars, in almost every size, from those for voituresses to those for large cars, were shown by the New York Tyre Company, Limited. New York tyres, which had been run over 7,000 miles, were also on this stand. The tyre is of the single-tube pattern; but an inner tube of rubber is vulcanised to the

lens were also shown by M. Godin, whose display was completed by a selection of Hommen's coils.

Two large steam waggons were displayed by the Lancashire Steam Motor Company. To deal first with the vehicle which bore the legend "Corporation of Liverpool," this was fitted with an open tip body, and is intended to carry a load of four tons. The under-frame is of channel steel, well stayed with cross channels and angle plates. The boiler is of the fire-tube type, having 80 square feet of heating surface, constructed for a working pressure of 200 lbs. per square inch. It is constructed so that the outside shell can be lifted off for cleaning purposes, and is located in the fore part of the frame. The engine is of the horizontal compound type, having cylinders $3\frac{1}{2}$ by $6\frac{1}{4}$ by 6 in. stroke. It is fitted with link motion; the low-pressure cylinder can, in case of emergency, be worked with high pressure steam. It is entirely covered in, the cranks working in oil. The transmission is by spur-gearing to the countershaft, two speeds being provided, the change-gear wheels working in a dust-proof and oil-tight case. A special arrangement known as a cushion drive is fixed on the ends of the compensating gear-shaft. This allows the engine shaft to make almost a revolution before full power is exerted upon the rims of the road-

FIGS. 124 AND 125.—SIDE AND FRONT VIEW OF LANCASHIRE STEAM MOTOR CO.'S 7-TON WAGON.

outer cover, which has very heavy walls of fabric and pure para. There is but 1 in. (diameter) cross section of air space in the centre, the rest of the tyre being material built up to $3\frac{1}{2}$ in. diameter cross section. The outer cover is pure para about $\frac{1}{2}$ in. thick, next inside of which come layers of fabric wound transversely all around the tyre. This is done to cause the grain of the fabric to run diagonally in opposite directions, which, it is claimed, prevents any ordinary punctures. The tyre will stand enormous air pressure, and is claimed to be very resilient. The company has issued a new pamphlet of instructions with regard to its tyres, and at its stand also exhibited the Midgeley steel tubular wheel, and a 7 h.p. De Dion engine.

Of varied interest was the display made by M. André A. Godin, which included some useful accessories. Much space was given to a display of Sclaverand's valves, pumps, greasers, lubricators, reservoirs, etc. The interchangeable valve for voituresses and larger cars was shown in sizes ranging from $1\frac{3}{8}$ in. to $3\frac{1}{8}$ in. in length, with diameter measurements ranging from $\frac{1}{16}$ in. to $\frac{1}{8}$ in. M. Godin also supplies the motor-cycle valves by the same maker. Ducellier's lamps were on view at this stand, prominence being given the Lenticular motor lamps fitted with a lens similar to that used in the naval search-lights. In the ordinary carbide lamp one tap only is required for lighting or extinguishing, while the ease with which the cleaning can be done is a useful feature. Paraffin-oil lamps for use as side lights and a lamp with a combination of conical radial reflector and optical

wheel, thus considerably reducing the shock that would otherwise be put upon the engine and gearing when starting a heavy load. An automatic feed-pump is driven by an eccentric from the compensating gear-shaft; it is fitted with double-check valves to both suction and delivery. There is also a steam pump for supplying the boiler when the engine is standing; an arrangement is also provided for working this pump by hand when steam is down. A water-lifter is fitted to the side of frame, and 30 feet of suction hose, with rose, is provided. The water-tank has a capacity of 130 gallons. A new departure was seen in a vehicle to carry 7 tons, two views of which are given in Figs. 124 and 125. The first feature of novelty to attract attention is that the front wheels are located much nearer together than the driving wheels. They are carried on a solid axle which is pivoted in a guide-block sliding in horn plates in the centre of the car. A single helical spring supports the front of the vehicle upon its front axle, a turntable being interposed between the two parts. The chief advantage claimed for this arrangement over the ordinary form of steering is that the wagon can turn in a shorter radius. Steering gear, having a vertical pillar carrying the wheel, operates the turntable by means of bevel and worm gearing. The power equipment consists of a 35-h.p. engine having cylinders 4 in. and 7 in. diameter by 6 in. stroke. The boiler is of a new type, having a superheater, which practically forms the fire-box. Coke is used as fuel. The throttle-valve is so arranged that steam brakes are applied to the wheels if it is moved beyond the "off" position on its quadrant, so that

the driver can, therefore, not only shut off steam, but, by a continuation of the same movement, apply the brakes. Two speeds are provided. The cushion drive, which is fitted inside the sprocket-wheels of the countershaft in the chain-driven type, is still retained in the new type, but in this case it is enclosed in the hub of the rear wheel. The whole of the transmission gear, as also the moving parts of the engine, are enclosed in a casing, and there is a stationary sleeve surrounding the live rear axle. The arrange-

FIG. 126.—THE BAKER ELECTRICAL PHAETON (see page 182 ante)

ment cannot, however, be clearly explained without a drawing.

The exhibit of the British and Foreign Motor Car Co., Limited consisted of a display of the Rochet light cars, voiturettes, and motor-cycles. To deal first with the light cars, of which two were staged, both with well-finished *tonneau* bodies. These comprise a number of interesting features. The main frame is of weldless steel tubing, in addition to which is an underframe of T-shaped channel steel, reaching downward and upward to the frame proper. It consists of two parallel girders laterally braced and strengthened, and carries the motor and gear-box, the centre of the shafts of which are in line. The engine is of the slow-running type, and comprises two vertical cylinders. It develops 10-h.p. at a normal speed of 750 revolutions per minute. The valve-chambers as well as the cylinders are water-jacketed, the valves themselves being so arranged as to be capable of being readily withdrawn. The water-circulation is maintained by a slow-running pump, which forms an extension of the motor-shaft. A feature worthy of notice is that the tubular frame is ingeniously made use of in connection with the water-circulation. Electrical ignition is adopted. The timing-gear is enclosed in the crank-case and runs in oil. The tremblers are fitted on the coil, and, as the latter is fixed near the engine, only short lengths of wire are necessary. The carburettor is of the constant-level spray type. A governor of the centrifugal type is provided. It acts on the exhaust valve, cutting out when the engine exceeds the normal speed mentioned above. In connection with it is an "accelerator." The power is transmitted through a friction-clutch to the change-gear box, which is adapted to give four speeds forward and a reverse motion, all being controlled by a single lever. The Rochet change speed gear is of a special form, and has been described at length in the *Journal*. It has only one gear in mesh at a time, and can be instantly changed from first to fourth, or from fourth to first speed, the clutch being automatically disengaged when the gear is being changed. A pedal applies a band-brake

on the countershaft, while the brakes on the hubs of the rear road-wheels can be actuated either by hand or foot; the first action of applying any of the brakes is to disengage the motor from the transmission. The road-wheels are of the artillery type shod with pneumatic tyres. One of the cars was fitted with bar-steering and the other with the standard inclined hand-wheel. The weight of the complete vehicle is about 18 cwt. Of the Rochet voiturettes two were shown, one having a phaeton body and the other a *vis-a-vis*. The engine, a $4\frac{1}{2}$ -h.p. Aster, is located in the rear part of the frame. Two speeds are provided, the engine driving the rear-axle direct on the high speed. Two powerful brakes are fitted, one acting on the differential, applied by foot pedal, and a double band brake acting on the hubs of the driving-wheels, the latter being intended for use in case of emergency. The frame is of tubular construction suspended on laminated steel springs. Steering is controlled by an inclined hand-wheel. The car complete weighs about $5\frac{1}{2}$ cwt. One of them took part in the Dashwood Hill trials on Saturday last, the results being given on another page. Our report of this stand may be concluded by a brief reference to the Rochet quadricycle, fitted with $4\frac{1}{2}$ -h.p. water-cooled Aster motor and a Bozier gear giving two speeds and a free engine. A modification in this machine is that the current is now switched on and off by means of the brake-lever.

The Richter Manufacturing Company showed their patent automatic oil economiser—a tank which is not only a safe means of storing liquids, but also an effective method of distributing them without loss. A pump takes the place of the usual "draw off" tap, thus obviating all risk of leakage or any possibility of a tap being left open. No "save-alls" are required, and the risk of storing petroleum spirit is reduced to a minimum by the adoption of this firm's speciality. The tank is rectangular in form,

FIG. 127.—THE ROCHET LIGHT CAR.

and provided with a lid which affords protection against evaporation, pollution, or abstraction. The act of lifting the lid raises the discharge pipe automatically into a working position, whilst the closing of the lid causes the depression of the discharge pipe to hermetically seal the well by means of a valve. The Richter Company also exhibited a rotary lubricating pump for the continuous lubrication of steam-engine and other large shafts and bearings. Altogether the firm's display, though small in extent, was of much practical interest.

A large display of the Dennis light cars was made by Messrs. Dennis Brothers, Limited, including one in the rough to show the workmanship, and also a chassis. These vehicles were illustrated in the *Journal* a few months ago, but we may mention that they are fitted with 8-h.p. De Dion water-cooled engines, the circulation being maintained by a Panhard-type pump and large radiators. By means of a device which acts on the exhaust-valve the speed of

FIG. 128.—THE DENNIS 8-H.P. LIGHT CAR.

the engine can be reduced as desired, minimising the consumption of petrol, and rendering it practically noiseless, without affecting the carburation. The regulator is brought into action when the friction clutch is released, either of the brakes applied, or by a pedal specially fitted for this purpose. Three speeds and a reverse are provided, the power being transmitted through a friction-clutch, gear-box, universally-jointed shaft, and bevel-gearing to the rear live axle. On the high speed the engine drives the axle direct, the pinions in the gear-box being only brought into use when the lower gears are employed. The hubs of the rear wheels are fitted with drums inside which are double-acting (equally well backwards or forwards) expanding metal brakes. There is also a brake, applied by a pedal, acting on a drum on the universal shaft; the application of either of the brakes first disengages the friction-clutch. The road-wheels are of equal size, shod with pneumatic tyres. The cars complete weigh about 11 cwt. The *tonneau* bodies are well finished, and are provided with high backs to the rear seats. Our report of this stand may be concluded by a brief reference to the Dennis motor-tricycles and quadricycles, both fitted with 2½-h.p. De Dion motors with water-cooled heads. The quad is fitted with a Dupont gear, giving two speeds and free engine. The coils are mounted on the left-hand side of the axle-bridge above the silencer, so that there is only a short length of high tension wire from the coil to the sparking-plug. In addition to the usual balance-gear band-brake, band-brakes on the hub flanges of the rear wheels are fitted to both machines.

Fig. 129 illustrates the neat two-seated car exhibited by the Swift Motor Co., of which a chassis was also shown to enable the arrangement to be inspected. The car, which comprises several special features, is built to carry two persons. The seat is well upholstered, broad, and wide. There is ample foot room, and in the back of the car is a neat boot for the carriage of luggage. The frame is of tubular construction. It is of considerable length and breadth for a two-seated car. A genuine De Dion 4½-h.p. engine is carried under a bonnet in the fore part of the frame. The water circulation is maintained by chain-driven pump and radia-

tor; the water tank is set forward of the dash-board inside the motor bonnet. Two speeds are provided, the method of transmission being on novel lines. The engine drives by spur-reducing gear on to the clutch shaft, the power being transmitted from the latter through a universally-jointed shaft on to the rear axle. This jointed shaft has two bevel pinions, of different sizes, running free on the end of it, and these are always in mesh with a large bevel pinion fixed to the back axle in the usual way, and a smaller one inside the large one in the space usually occupied by the differential. Between the two bevel pinions on the jointed shaft there is a positive clutch operated by a lever on the steering wheel, which locks either at will, and so gives the high or low speed. When this clutch is in a central position both the pinions revolve idly, and the power of the engine is not communicated to the road wheels. No differential gear of the ordinary type is employed; as a substitute both the road wheels are fitted with free-wheel clutches of the ratchet type, such as are in use on bicycles, but of course much larger. The clutch, which is held in position by a strong spiral spring, is used in the ordinary way for starting or

disconnecting the engine suddenly when stopping or in traffic. If it is desired to disconnect the gear altogether, as when the car is left standing with the engine running, the positive clutch on the gear box is put in a central position. The free wheel clutches on the rear road wheels not only permit one wheel to overrun the other on turning corners, but enable the car to run absolutely free down-hill just as a free-wheel bicycle runs free. In other words, the moment the speed of the car exceeds that of the gear the engine runs free, so that it is impossible, therefore, for the car to drive the engine. There are three small levers on the inclined steering column; one works the positive

FIG. 129.—THE SWIFT VOITURETTE.

clutch for changing the gears, the second regulates the mixture and the third the ignition. A pedal actuates band brakes on the hubs of each of the rear road wheels, to which emergency hand-operated tyre brakes are also fitted. The frame is carried on semi-elliptical springs forward; the body rests on elliptical springs at the rear, and upon spiral springs above the frame at the front end. Cycle type wheels, 26 in. diameter, are fitted throughout, they being shod with 3 in. pneumatics. The weight

of the little car complete is $6\frac{1}{2}$ cwt. Other cars on the stand were a double phaeton fitted with $5\frac{1}{2}$ h.p. M.M.C. motor, and a four-seated *tonneau* with 8 h.p. M.M.C. engine. These vehicles were described at length in our report of the 1901 Show. Several small improvements have been made, but to all intents and purposes the specification is as before. The main alteration is the use of a Renold silent chain to convey the power from the engine to the countershaft. The motor-cycle section of the Swift Co.'s exhibit comprised a $2\frac{3}{4}$ h.p. motor-quadracycle, fitted with Components engine behind the axle bridge, and a $2\frac{3}{4}$ h.p. motor-tricycle with balance-gear band brake, and a rubber-covered spoon brake on the front tyre.

The display of Messrs. G. Straus and Co. consisted of a large array of the petrol motors and change-speed gears made by the

FIG. 130.—ELEVATION AND PLAN OF AACHENER & CO.'S $1\frac{1}{2}$ H.P. BICYCLE MOTOR.

Aachener Stahlwaarenfabrik. The bicycle-motor (Fig. 130) is of the air-cooled type, and has a cylinder 65mm. diameter by 71mm. stroke, the power developed being $1\frac{1}{2}$ h.p. The bearings are made of specially-prepared phosphor-bronze; the valves are easily accessible, the suction valve can be removed by the loosening of a single bolt; the suction valve itself is not screwed on, but is held in position by a bridge-fastening device. The exhaust valve is provided with a regulator to control the speed of the motor; this arrangement does away with the usual compression tap, as, by raising the exhaust valve, the compression is non-acting. The engine is also provided with a small ball-shaped valve to balance the counter-pressure, which is caused by the downward stroke of the piston. Larger sizes of the Aachener Company's water-

cooled motors were to be seen in a 5-h.p. water-cooled single-cylinder (90mm. diameter by 100mm. stroke) running at a normal speed of 1,500 revolutions per minute; a 8-h.p. single-cylinder and a two-cylinder (90mm. by 100mm.) motor having external flywheel and running at 1,400 revolutions per minute. Change-speed gear boxes, rear axles with differential gears are other specialities of the company, samples of which were displayed.

Messrs. Peto and Radford, Limited, made a varied display of their specialities, these including the "armoured" accumulator, in which the plates are protected so as to preserve them from mechanical injury. Each plate consists of a pasted lead grid of extremely light section, thus securing a maximum of active capacity for the size of plate employed. Around this is a case of lead perforated with circular holes. This case gives the necessary strength and mechanical support to the grid. Between the case and the grid itself, on both sides, is placed a sheet of perforated ebonite or celluloid. These act as separators, entirely preventing the paste from falling out of the grid, and from causing a short circuit through bridging across the plates. Primary batteries and accumulators for motor-cars, quads, voiturettes, and petrol launches formed an attractive feature of this firm's

FIG. 131.—PETO AND RADFORD'S ACCUMULATOR-CHARGING DEVICE.

display. Volt and ampere meters, testing and inspection lamps, pole testers, etc., were also included in the general selection of electrical accessories for the use of automobilists. A charging button was shown, which enables the accumulator to be connected in series with the lamp when being charged from an electric light circuit. The socket is inserted into the lamp-holder, the poles are tested by a pole-tester or paper, and the accumulator connected up as shown in Fig. 131.

Oil-cans of many forms and of various types were shown by Messrs. Joseph Kaye and Sons, Limited. The firm's patent seamless oil-cans are admirably adapted for their purpose, and the specialities exhibited included seamless copper, brass, and steel oil-cans with interchangeable and fixed spouts. An improved oil economiser or "save-all" for storing quantities of thick lubricating oil was shown. This can also be adapted for storing petrol, and is made in sizes to contain 4 to 200 gallons. A special feature was being made of an oil-can with a long spout intended to reach those parts of the machinery of a car inaccessible by the ordinary cans.

(To be continued.)

A THREE miles motor-cycle handicap is to be held at Worthington on Whit-Monday.

TO-DAY (Saturday) the members of the Irish Automobile Club leave Dublin for a two-days' tour to Rostrevor.

HERE AND THERE.

A PEDAL-OPERATED motor horn, as shown in the accompanying illustration, has recently been introduced by the Gleason Peters Air Pump Company, of Houston Street, New York. The pump is fastened underneath the body of the vehicle, and has a sleeve which fits over the plunger rod, thus allowing the foot-board

to be readily removed without disconnecting any part of the apparatus. The horn can either be connected directly to the pump as shown in the illustration, or may be fixed in any suitable position, a rubber tube connecting it with the pump.

MESSRS. LAMPLUGH AND CIE, of Levallois-Perret, near Paris, have sent us a photograph of a Limousine body they have specially designed and built for a 10-h.p. Mors frame. The back seats are arranged to give seating capacity for three people, and the front one for two persons. The entrance is in front by a sliding door; all the windows can be removed in order to have plenty of air in summer time, and can be entirely closed for winter and wet weather. At the rear part of the car a large tool box is arranged to open outwardly, and extra tyres can be carried on the top of the car. The mud-guards are built up close to the car, enabling wicker baskets to be secured on the top of them.

MR. W. JOHNSON, of the British and Foreign Motor-Car Company, Limited, has just completed and patented a two-speed gear suitable for motor-bicycles, which is all contained within the hub, and which is worked by two friction clutches. The drive from the motor is by chain, although belts may be used, and the motor can be kept running without affecting the speed of the bicycle in traffic. Mr Johnson intends to fit the device to the 1. h.p. motor-bicycle, which will, he considers, be sufficiently powerful on a properly designed bicycle fitted with the new hub.

A NEW motor tube has been introduced by the Collier Tyre Company, in which the durability of the red rubber tube and the facility of repair associated with the grey rubber tube are combined. The tube is made of red rubber, which, being cured with salts of antimony, wears better than the grey variety, which is cured with sulphur only. But the presence of an outer skin of grey rubber assists the motorist in repairing his tube by the roadside instead of having to drive his car on a deflated tyre and ultimately send the tube to the makers for the necessary repair. The new Collier tubes are made in various sizes to suit different makes of tyres.

THE Hon. C. S. Rolls gave a lecture before the Birmingham Municipal Engineering Society, at the Technical Schools, a few days ago. The lecture was illustrated by lantern slides, and dealt with the past history as well as a review of the present state of the motor industry. The lecture was well attended, there being evidently much interest taken in Birmingham in automobilism.

A CAPITAL map of London, on a sheet 36 in. by 26½ in., has been brought out by Messrs. George Philip and Son, which should be useful to Metropolitan motorists, whose name is legion. It is on the scale of one mile to an inch, and the way in which the roads are marked is clearness exemplified. Railways, too, are indicated, thus providing a kind of stand-by in the case of breakdowns or punctures.

THE Century Engineering and Motor Company have just issued a useful sheet of instructions for the management of Century motor tandems. It is divided into eleven paragraphs, and is written with the idea of enabling the user of one of these machines to start it for the first time with a minimum amount of trouble when he receives it from the works.

MOTORISTS touring along the Great North Road and through Grantham will find, close to the parish church and the Angel Hotel, well equipped workshops and storage room for motor-cars. Mr. George R. Burton has every facility there for the execution of repairs and the supply of petrol. His address is Motor Works, Church Trees, Grantham.

THE Caledonian Motor-Car and Bicycle Company have erected a new factory in Rosebank Terrace, Aberdeen, and have provided accommodation for storing motor-cars at fixed rates. An owner may have a separate apartment for his car for £6 per annum, and facilities for cleaning and repairing are also provided.

THE Brighton and Sussex Motor and Carriage Works Company is establishing a garage in Conway Street, Hove; their showrooms are at 29, King's Road, Brighton, Mr. F. Constable being the general manager, and Mr. F. Parker being in charge of the Hove establishment.

M. H. ARNAL, a French motorist, employs a simple device to lock his motor-car when he has occasion to leave it unattended for any length of time. To the bottom of the hand brake lever there is brazed a small lock, S, the bolt of which can enter the

notches of the tooth sector. When leaving the car, the brake is put hard on and locked. When not in use the lock in no way interferes with the use of the brake lever. M. Arnal, who has had the device in use on a 6-h.p. car for over a year, adds that any locksmith ought to be able to quickly fit brake levers with a similar locking arrangement.

MESSRS. R. STEPHENSON AND COMPANY, LIMITED, the well-known engineering firm of Newcastle-on-Tyne, have placed an order with Messrs. George and Jobling of that town for a 8-h.p. Argyll car which will be used by them for business purposes.

CORRESPONDENCE.

WARNINGS TO MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 3rd inst. a letter appeared from Mr. Scriven on the subject of alleged police intolerance on the road between Bradford and Stanningley, and as a motorist who, in common with most others in the locality, has received consideration at the hands of the police in the district, I have been down and interviewed the inspector and sergeant at Stanningley to ascertain the facts.

I would say that the road there has a lot of traffic on it in addition to a double line of electric trams. There are two turnings each at a sharp angle, and the distance between the two bends is (approximately) half a mile. The police have measured out two lengths, and it was on these lengths that two people were timed and proceedings taken. One car travelled 438 yards in 30 seconds, and the other 840 yards in 65 seconds. Owing to the sharpness of the angles of the bends there is not the least difficulty in accurately timing these stretches. After the second bend there is a sharp dip in the hill which leads to the Stanningley tram terminus (where there are generally one or two cars waiting), and thence into the somewhat congested main street of Stanningley. Any broad or fair-minded person would admit that this corner is a dangerous one, or at least one requiring caution and a slow speed. I must say that both the inspector and sergeant were very courteous, and said that action had only been taken when warnings had become of no use; they say that it is against any interest of theirs to be antagonistic to motor-owners, and they are quite open-minded on the subject of higher speeds on open country roads. They argue (quite properly) that they are bound to carry out the law, and from what I have seen I cannot say that there has been an injustice done to your correspondent or others who were fined. I have gone to some trouble to get at the facts of this matter, in fairness to our local police, who, as above mentioned, have as a rule been fair to myself and a number of brother motorists in Bradford. In conclusion I would remark that the best way to get the speed limit raised is by exercising caution on all such roads as above described, and a little cultivation of the police would also help to smooth matters.—Yours faithfully

HERBERT A. JONES.

PUNCTURES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read "Doc's" letter in the issue of the *Journal* of the 3rd inst., and also your reference to it, I send you my experiences with Michelin tyres. I have had them fitted to three of my cars. The first was a light one, the third I have not yet driven very far. The second was a 6-h.p. Panhard, weighing about 16 cwt. The tyres were 65 mm. voiturette. I have found that genuine punctures were of rare occurrence, the cause of the trouble being much more often faulty replacement of the tube in the cover, and an insufficient quantity of French chalk. When I had become used to the detachment and replacement of these particular tyres I was practically free from trouble, and had not even to use the pump for weeks together.

A friend accompanied me on a run from Cirencester to Birkenhead just before Christmas. We both had luggage, and the car must have weighed over a ton on that trip. The roads were alternately covered with water, mud, and frozen snow. The tyres gave us no trouble whatever. On the return journey, and from Cirencester to Bridgewater, a month later, when the car was rather lighter, I experienced the same freedom from tyre troubles. I admit that this experience may be exceptional, but at the same time it goes to show that punctures are anything but inevitable. I think that they may be reduced to a minimum by using tyres with as tough a tread as possible; accurately fitted to the wheel rim, and carefully put on with plenty of French chalk inside the cover. In a motor tyre one does not look for the same resiliency as in bicycle tyres, even in proportion to their strength, and strength seems therefore the primary consideration.—Yours truly,

JOHN ASPINALL.

MILITARY AUTOMOBILES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the article entitled "Military Automobiles," in last week's issue of your *Journal*, I can cordially endorse the views expressed therein. My company (the Automobile Transport Company) and, as I have reason to know, others also, received the circular letter from Captain Walker, given by you *in extenso*. In response we duly forwarded our quotations for the several goods mentioned, as, no doubt, did other firms who were asked to do so. At the recent Motor-Car Exhibition it must have been somewhat galling for Englishmen to see an American automobile used by our military men in the South African hostilities. I in no way wish to detract from the utility of these light cars, but it is sincerely to be regretted that enquiries for them should have been set afoot in the United States. In the new industry we have quite enough to occupy us in attempting to keep pace with such countries as France. Motor-cars will assuredly play a very important part in the battles of the future. If, therefore, British officials are predisposed in favour of alien products,

our manufacturers should be thoroughly "alive" and on the alert to successfully defeat foreign competition.

Englishmen, to say the least of it, would be furious were the Government to propose having our warships built at Stettin or Philadelphia. I contend, then, that the cap fits equally in the case of military motor-vehicles.—Yours truly,

E. HUGH OWEN.

MOTOR BALLOONING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In ascribing ignorance of airships to poor Severo, M. Santos Dumont forgets for the moment the exceedingly narrow escapes he has himself experienced. In my opinion it is only by a succession of lucky flukes that he is alive to-day. The fact cannot be sufficiently emphasised that motor-ballooning never will be safe; as also the fact that the inevitable casualties attendant on that perilous pursuit form no argument against legitimate mechanical flight, with which "the man in street" is too apt to associate it.—Yours faithfully,

SYDNEY H. HOLLANDS.

FURIOUS DRIVING CASES.

NORTHUMBERLAND BROWN, Blatchington Road, Hove, was summoned at the Haywards Heath Petty Sessions, on Monday, for driving a motor-car at a greater speed than twelve miles an hour on the London Road, Burgess Hill, on April 25th. James Williams, of the Junction Inn, Burgess Hill, said that on the afternoon of April 25th he was driving along the London Road, and when by Clayton Priory he saw a motor-car with five men on it coming from Burgess Hill at a very reckless speed. When within 160 yards of him, seeing they were swaying from one side of the road to the other, he signalled to them to keep on their proper side of the road. They took no notice, and when within thirty-five yards of him he shouted to them to stop, but they continued, and came right under his horse's head. He drew back, but there were three vehicles behind him, and he was driven back right on to the hedge. His trap overturned and was smashed. Ernest Travis, carman, who was driving a horse and van, said he saw the motor-car coming from the direction of Burgess Hill. He was about six yards behind Mr. Williams, and heard the latter shout out for the car to stop. It stopped about thirty yards in front. The car had to cross the road to stop. He estimated the speed at from twenty-five to thirty miles an hour. He saw the pony trap upset and Mr. Williams and the boy thrown out. William Wild, wheelwright, Burgess Hill, said he saw the motor-car coming towards Hassocks. He estimated the speed at from twenty-five to thirty miles an hour. The defendant said he had had five or six years' experience of motor-car driving. He had taken a party of gentlemen as passengers to Sagger's Farm, Bolney, and was driving the car. On the return journey, when by Clayton Priory gates, he saw nothing of Mr. Williams until his car had passed the bend of the road. He then saw Mr. Williams' trap passing Meeds' van. He was on his wrong side. The pony was restive, and he put on the brakes and stopped dead, forty yards in front of Mr. Williams, who threw the reins on the pony's back and jumped out. After other evidence, the Chairman of the Bench said there would be no conviction in the case.

MR. V. S. ALLPRESS, of King's Croft, Eltham, has been summoned before the Dartford magistrates for driving a motor-car at the alleged rate of twenty miles an hour. Two police officers were positive that a distance of 350 yards was covered in thirty-five seconds, but owing to the evidence adduced by the defence, and the point raised as to the inconclusive nature of attempts at timing speed without stop watches, the police were unable to establish their case. Sergeant Vouden said that on the afternoon of Sunday, the 13th of April, he saw the defendant driving a motor-car from the direction of London. He timed the progress of the car from the Chequers Inn to where he was standing at the Vicarage, a distance of 350 yards, and found it was covered in thirty-five seconds, being at the rate of about twenty miles an hour. He informed defendant he would be reported for travelling at excessive speed. After evidence by the defendant and his witnesses, and the Bench having deliberated in retirement, the Chairman announced that they had given the case most careful consideration, but they did not consider it had been proved to their satisfaction, and therefore it would be dismissed.

At the Haywards Heath Petty Sessions, on Monday, Albert Kessler, York Place, Brighton, was summoned for driving a motor-bicycle at a greater speed than twelve miles an hour, on the London Road, Burgess Hill, on April 27th. Defendant was fined 30s. and 10s. costs.

At Chertsey Petty Sessions, Arthur Jones, of Cobham, was summoned for furiously driving a motor-car at Weybridge, on April 9th. Inspector Marks stated that defendant covered a certain distance at a rate of thirty miles an hour. By the defendant: He believed that the defendant had the machine under proper control, and he passed the traffic in a proper manner. The defendant said he was not aware that he was going at thirty miles an hour, but he pleaded guilty to the charge. Fined 40s.

OSWALD EDWARD LORD, twenty-three, of Arundel Mansions, Fulham, has again appeared at Marlborough Street Police Court, London, on charges of being drunk and furiously driving a motor-car in Regent Street, thereby causing bodily harm to Henry Mejlach, a Russian Pole, and also of being while drunk, in the possession of loaded firearms. He explained the accident by stating that he got on the wrong side of the refuge, and in order to avoid a collision with a cab jammed the brakes on too suddenly. There

was too much momentum on the car, which was a powerful 40 h.p. one and that, with the steep gradient, caused it to skid and slip. Mr. Denman remarked that, according to his own showing, he was on the wrong side and going too fast. If it was contended that side-slip was sometimes unavoidable with motor-cars, then persons were liable at any time to be knocked down and perhaps killed. Mr. Leonard Gay said he was the owner of 91, Regent Street, and carried on business there as Boswell Hensman, silversmith. He roughly estimated the damage to the shop front (outside the damaged stock) at £300. Mr. Denham said that a remand was necessary, in view of the possibility that there might be a charge of manslaughter arising if the injured man died. Defendant was remanded on bail, as before, in £200.

At the Petty Sessions at Stony Stratford, before the Duke of Grafton, K.G. (in the chair), Mr. A. Grant-Thorold, Mr. E. H. Watts, and Mr. T. Byam Grounds, Ernest Ashby, of Kettering, was charged with driving a motor-car at an unreasonable speed, at Potterspurty, on April 19th. Mr. G. J. Phillips, of Northampton, appeared for the defendant. William Pratt, landlord of the Anchor Inn, Potterspurty, said he was standing in his bar at 4.15 p.m., and all at once he saw a horse and trap and a motor-car at the cross roads. A dog was run over by the motor-car and killed. He should imagine that the motor-car was travelling eighteen or twenty miles an hour. The driver of the car did not attempt to stop. Cross-examined by Mr. Phillips: The corner was very dangerous at the cross roads, and witness wondered accidents had not occurred previously, considering the speed vehicles travelled. The defendant came back two hours afterwards. Harry Jones said the motor-car in question passed him near Potterspurty at about twelve miles an hour. The speed was subsequently increased, and the car was going fifteen miles an hour through Potterspurty. Witness thought it was Mr. Victor Ashby who was driving, and not the defendant. After evidence for the defence the Bench, after consultation in private, concluded that there was not sufficient evidence, and, giving the defendant the benefit of the doubt, they dismissed the case.

At Huntingdon Police Court, Mr. G. Iden, Motor Mills, Coventry, has been summoned for driving a motor-car on the Great North Road, on April 17th, at a greater speed than twelve miles an hour. The Bench considered that the car was travelling above the legal limit, but as there was nothing to show that defendant was driving to the danger of anybody on the road they would only fine him £1 and costs.

T. S. MANNING, manager of the Southdown Brewery, East Grinstead, was fined £5 and 9s. cost at the Uckfield Petty Sessions, for driving a motor at a greater speed than twelve miles an hour. The constable stated that defendant covered 440 yards in 34 seconds.

FRANK G. BARTON, Oxford, was summoned at the Abingdon Petty Sessions for driving a motor-car at an excessive rate of speed along the Oxford Road. P.C. Ponsford said he timed defendant, and found he covered 530 yards in 36½ seconds. Mr. Andrew Walsh, for defendant, said the pace at which defendant drove was only fourteen miles an hour. A fine of £5 was imposed, with 8s. costs.

ALFRED RIVETT, 252, High Road, Leytonstone, was summoned at Chelmsford, but did not appear, for riding a motor-bicycle furiously between Brentwood and Chelmsford. Fined £2 10s. and £1 0s. 8d. costs.

THOMAS GILFORD, Stroud, was summoned at the Whitminster Police Court for having ridden a motor-cycle at a speed exceeding the legal limit. He was fined 27s., which included 17s. costs.

NEGLIGENCE.

THOMAS WALTER RUSH, 91, Church Street, Edgware Road, London, was summoned at the Bullingdon (Oxon) Petty Sessions for negligently driving a motor-car on the highway, on April 21st, to the common danger of passengers. He pleaded not guilty. W. Polley, of Cowley, who had instituted the prosecution, said he was driving towards Nuneham on the day in question, when the defendant's motor-car came down the hill and struck the off wheel of his trap. Both wheels were clean cut off, and he and his wife, who was driving with him, were thrown to the ground. After a long cross-examination Mrs. Polley was called, and corroborated the evidence of the previous witness. After other evidence had been given Mr. Forrest Fulton, who appeared for the defence, said the motor-car was not going at a pace of more than ten miles an hour, and that the accident was caused by the pony in the trap shying and backing the vehicle on to the motor-car. Several witnesses were called for the defence, and after a brief deliberation with the other magistrates the Chairman said they were satisfied that although the pony did shy the accident would not have happened had the driver of the motor-car been as careful as he could be, and as far as he ought to have been on his own side of the road. The defendant would be fined £2 and 5s. 6d. costs.

CANCELLING A CONTRACT.

MR. JUSTICE JELF, on Tuesday, heard the action brought by the General Automobile Agency against Mrs. Florence Waller, the actress, to recover £500, the value of a 6-h.p. motor-landaulette. Mr. Farman's case was that in August, 1901, he agreed to build the landaulette, one of the terms of the contract being that until this was completed he should lend Mrs. Waller a Peugeot coupe. Mrs. Waller paid Mr. Farman a deposit of £100, and his firm proceeded to build the Panhard; at the end of a month the defendant cancelled the contract. The result was that the Panhard landaulette was left on the firm's hand incomplete. The defence was that the firm had not carried out the terms of the contract.

NO LIGHTS.

At the Slough Petty Sessions Charles Pearce was summoned for driving a motor-car with out exhibiting red lights in the reverse direction to that in which the car was travelling, on April 17th, at Slough. Defendant pleaded not guilty. Police-constable Pearce said about 8.50 p.m. on 17th inst. he was on duty in the High Street, with Sergeant Shore, when he saw the defendant driving a motor-car and not showing a red light in a reverse direction to that which he was travelling. Defendant said it would be impossible for anyone to see the lamps if they were close behind the car, but vehicles approaching the car from the rear would be able to see the lights to within fifteen or twenty yards of the car. Police-constable Pearce said he was fifty yards behind and walked to within ten yards, and he could not see the light. Standing at an angle of forty-five degrees and three yards behind they could see the light, but not otherwise. The Chairman said the Bench were much divided on the matter, and they thought the defendant should have the benefit of the doubt, and the case would therefore be dismissed.

REFUSING TO STOP.

F. W. RUMSEY, of Winchester, was summoned before the Winchester County Bench for refusing to stop his motor-car when desired to do so, on April 16th, at Twyford. It appeared from the evidence of A. Smee, coachman to Colonel Little, and also from the Colonel himself, that the carriage drawn by a mare of restive temperament, and containing the Colonel and Mrs. Little, was being driven home to Twyford by Smee, about 4.30 p.m., near Twyford Lodge. As there had been some trouble with the mare and a motor-car some days before, Smee, on seeing defendant coming towards them, raised his hand and whip as a signal to stop till the horse had passed, but no attention was paid to the signal nor to the shouts of Colonel Little, and defendant passed the carriage, happily without accident. The Bench said drivers of motor-cars were bound in law to stop when called on. Here, happily, there was no accident nor charge of excessive speed. Fined 20s. and 11s. costs.

ALLEGED POLICE PERJURY.

At the Grantham (Spittlegate) Police Court Mr. Samuel Harvey, florist, of Blyth Street, Nottingham, made application to the magistrates for summonses against the Spittlegate police authorities for procuring a local witness, an old man, to commit perjury. Mr. Harvey said that he was convicted in December last for furiously driving a motor-car. He (Mr. Harvey) was prepared to prove not only perjury against the police, but also conspiracy. The Clerk said Mr. Harvey ought to have given notice of his application. The Magistrates said they would consider the matter, and Mr. Harvey must apply at the next court.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. IV.]

LONDON, SATURDAY, MAY 24, 1902.

[No. 168.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

LAST week we referred to an interview between motor-cyclists, and the First Commissioner of Works, with regard to motor-cycles being allowed in London parks, and it was suggested that the present position was unreasonable and might easily be remedied without hurt to anyone. Mr. Akers-Douglas has since announced in the House of Commons that the position will be altered after July 1st, when

the restrictions will be removed so far as Hyde Park is concerned. If motor-cars and ordinary bicycles are allowed to run through the park, there is no reason why such a right should be withheld from motor-cyclists and hence we congratulate Mr. Akers-Douglas on so quickly conforming the regulations to common sense as soon as his attention was drawn to the matter.

Roads in the Parks.

THE discussion which preceded the announcement of the decision recorded above was interesting in many ways. It took place on the vote of £66,200 for the maintenance of the Royal parks and pleasure gardens. Mr. T. Lough, the member for one of the divisions of Islington, pleaded for the motor-cyclists, and Mr. H. J. Tennant, who said he happened to be one "of the unpopular brigade of four-wheeled motorists," not only urged the case of the motor-cyclist, but also drew attention to the necessity of the roads in the parks and pleasure gardens being kept in something like decent order. He assured the First Commissioner of Works and his fellow-legislators that if they ever went on a motor-car down Constitution Hill they would find little pleasure in the proceeding, for they would be apt to be made sea-sick owing to the unevenness of the roads. He therefore impressed on the authorities the urgent need for those roads to be put into better order. This is a point which ought not to be allowed to drop, and now that Mr. Akers-Douglas has secured something like uniformity in the regulations, we hope he will be equally solicitous in securing uniformity in the surface of the roads.

British v. Foreign Cars.

WITH regard to Constitution Hill being used by motorists, only one M.P. seems to have revived the spirit of prejudice which was shown in the earlier days of the movement. Mr. H. C. Richards protested against the invasion of Constitution Hill by motorists. He had constantly seen ladies unhorsed, and had been nearly unhorsed himself, through the horses being frightened by motor-cars dashing along at high speed. On the other hand, the police said "it was difficult to catch these motorists, some of whom were Members of Parliament." In concluding his speech, which seems to have evoked as much laughter as approval, he asked the Commissioner of Works to do something for those who preferred to encourage the breed of English horses rather than drive French machines with American oil. On this point Mr. Richards should read the *Motor-Car Journal*, when he will probably recognise that while

his gibe may have been true five or six years ago, its accuracy can now be safely questioned in view of the great advance that has been made by British makers.

The Taxation of Motor-Cars.

IN the discussion on the Finance Bill just before the House rose for the Whitsun holidays, Mr. Joseph Walton urged, as an alternative to the tax proposed by the Chancellor of the Exchequer, a graduated income-tax, the taxation of land values, and—strangest thing of all—the taxation of automobiles. What the motor cars have done to Mr. Walton that he should thus show his animus we do not know, but we are glad to see that Sir Michael Hicks Beach was not inclined to accede to the suggestion. Already motorists pay sufficient in fines and the costs of prosecutions to the county rates, without having to contribute an unfair proportion to the general revenue of the country. To add to the cost of a comparatively new industry is certainly not the way to promote the general prosperity of our national industries, and we hope that if Chancellors of the Exchequer will avoid taking such hints as that suggested by Mr. Walton, the time is not far distant when the manufacture of automobiles will be one of the leading trades of the country.

The Speed of Cars.

SCOTCH and Irish representatives in Parliament seem to take far more interest in the subject of motor-cars in London thoroughfares than do the representatives of metropolitan constituencies. A few weeks ago a member from the Emerald Isle asked two or three questions on the subject, and later a gentleman representing a Highland constituency sought to secure an assurance that motor-cars should be made to crawl rather than travel along the main highways. Last week Dr. Farquharson, another Scotch member, put a question of similar effect to Mr. Ritchie, who in reply said that strict orders had been given to the police in respect to the infringement of the law as to the speed of motor-cars. He acknowledged that difficulty exists in estimating even approximately the pace at which an automobile is travelling, and this is a point that we would ask county magistrates, who seem to regard the police as infallible judges of speed, to notice. The suggestion as to numbering motor-cars having been made to Mr. Ritchie, he rightly pointed out that if anyone has power to make such an order it is the President of the Local Government Board, but the Home Secretary expressed a doubt whether under the existing laws he has any such authority.

Municipalities and Automobilism.

WHILE many corporations at places around the coast are showing an unwise and foolish antipathy to motor-cars, some of the large municipalities are regarding the matter with enlightened visions. From Maidenhead to Glasgow we have lately received news of Councils considering the adoption of motor-vans for dust collection and of adopting the same system for the watering of streets. Everywhere interest is growing in this

department of the movement—further evidence of the utilitarian nature of the British people. Now we hear that the Corporation of Newcastle-on-Tyne are devoting attention to the matter, and we hope their deliberations may result in the adoption of a practical vehicle which will prove not only acceptable to the town, but the cause of imitation in others.

A Point for Drivers.

A CORRESPONDENT favours us with an inquisitorial letter which he has received in reply to an application for the position of driver with a public service company in the South of England. He complains of the multitude of questions which he was asked, but we are afraid that should he compare them with the form of application in connection with the Motor Service Register, just established by the Automobile Club, he will find cold comfort. The truth is that motor-car owners will have to exercise even more care than heretofore with regard to the employment of drivers. One point, however, he makes which seems far more reasonable, for it appears that one condition of employment was that he should make eight journeys per day, each averaging one hour and a quarter. In addition to this it would be part of his duty to spend an hour and a half overhauling the car every morning. On Saturday an extra journey would have to be made, and on Sundays six journeys would be

It was decided that a Motor Cycle Club would be a great advantage to all motor cycle riders, and a club was formed to be called the Lincolnshire Motor Cycle Club. A committee was elected *pro tem*. The following matters are to be discussed at a general meeting to be held this week:—Draft rules, designs for a suitable badge, opening dinner, runs, etc.

The Education of Horses.

ON Friday next the annual sale of the harness horses of the famous Brookfield Stud, the property of Mr. Burdett-Coutts, M.P., will take place on the Stud grounds at Highgate, and on Monday and Wednesday next there will be two public shows, to which intending buyers are invited. In connection with the sale the auctioneers announce that "A motor car—of more than usually hideous proportions, colour, noise and smell—will be going in the stud grounds up to the time of the sale, in order to thoroughly accustom the horses to the conditions under which they have to meet these machines on country roads, which is a very different thing from meeting them in the town traffic." This is a development in the education of horses which may possibly lead to some guarantee being given in future that the animals are not only quiet to drive but also sensible enough to regard the automobile with something like

A SNAPSHOT AT THE DASHWOOD HILL TRIALS.

Photo by]

[Mr. T. B. Percy.

expected. This, it seems, is rather unreasonable, for while the work may not be hard, it is tedious when too long continued without rest. Arrangements should be made by which motor-car drivers could have one day's rest in seven, especially if, as in this particular instance, they are expected to work thirteen or fourteen hours in the ordinary day.

The London and Oxford Road.

WHEN the next Club trials take place on Dashwood Hill, on June 3rd, it is fervently to be hoped that the principal roads will be free of unrolled stones. On May 10th a long length of granite at Loudwater played havoc with many a costly tyre, and it is not creditable to the usually well-kept main roads of Bucks that in the middle of May the whole width of this road should have been almost impassable even for a whole day.

A Lincolnshire Motor-Cycle Club.

Now that riders of motor cycles are becoming numerous in the county of Lincolnshire, a feeling has been expressed that a Motor Cycling Club should be formed. A meeting was called at the Albion Hotel, Lincoln, on Wednesday last week, when a goodly number of motor-cyclists attended.

friendly feelings. In the catalogue of the sale we notice it is acknowledged that "the modern nobility and gentry of the realm will probably go to Westminster Abbey in motor cars, but there may be one or two old fossils left who would like to see a true Coronation pair." For these latter a pair of state coach or barouche horses are to be offered. They are now on regular work between Piccadilly and Holly Lodge, Highgate, and—again we quote from the catalogue—"if the motor-car craze has left room for any pride in the old-bred English harness horse, no apology will be needed for calling attention to the special characteristics of the Brookfield breed, which are derived by heredity of pure breeding."

Application against a Constable.

MR. SAMUEL HARVEY, of Nottingham, who was in December last convicted of furiously driving a motor-car on the Great North Road at Long Bennington, applied to the magistrates at the Spittlegate (Grantham) Petty Sessions on Saturday last for a summons against Police-constable Kirk for suborning a witness named Baxter to commit perjury. Colonel Parker, the Chairman, said the magistrates had given due consideration to the application, and they did not think they were justified in granting a summons. Mr. Harvey said he was sorry they had come to that decision, but if the magistrates protected the police

who committed perjury, he had only one course open. His case was quite clear, and he would carry it further, straight to the King.

Mails by Electric Cars.

At 8.20 on Tuesday morning a new electrical mail van started its daily run from Mount Pleasant, Clerkenwell, its first load being a special delivery of mails to Waterloo. This is the first occasion upon which an English-built electrical motor-van has been used for this purpose, and the postal authorities, being most anxious to adopt the latest and most improved means of transit, are now giving this new system an extended trial in the City and West-end services. The contractors, Messrs. Julius Harvey and Co., after considerable tests, selected one of the Oppermann electrical delivery vans, the motive power being furnished by a set of A.B.C. accumulators. From the result of the trials already made those interested are very sanguine of the ultimate success of this new system, and if their hopes are fulfilled a large number of electrical mail vans will soon be running in London. The vehicle now in use was shown by Mr. Oppermann at the recent Exhibition, and we may add that an illustration of it was published in our issue of the 3rd inst.

Tolls over the Lea.

WITH reference to a letter from Mr. C. T. Cutler in our issue of the 3rd inst., respecting the toll on the bridge over the Lea, leading to a road through Netherfield Park, Ware, we learn that our correspondent's conclusions were not strictly in accordance with the facts. The toll to which he referred has been in existence for many years. When Mr. H. Lawrence Prior came into possession of the property the bridge over the Lea was in a dangerous condition, and he rebuilt it. Before then no locomotive of any description was allowed along the road, but when the bridge was rebuilt Mr. Prior removed the restriction, and fixed the tolls in proportion to those existing for carriage traffic. The tolls on motor-vehicles are also fixed on a proportionate scale. Mr. Cutler's statement as to loose flints being on the road was another inaccuracy, as the road is in very good order and not a single flint has been used in its repair for years. The road is intended for the traffic of the district, and is really a short cut for local convenience. Mr. Prior has no antipathy to automobiles, and we would advise our correspondent to be less hasty in writing to the newspapers in future.

Services in the Midlands.

A CORRESPONDENT in a Midland town, who feels that he could successfully start a garage therein, writes asking if gentlemen who have had experience of the work elsewhere will make suggestions that might be helpful in organising excursions and trips to neighbouring places of interest. He would propose to seek permission to stand a car at all the important cab stands in the town, to compete with the ordinary cabs. Only one consideration dissuades our reader from early commencement of the enterprise, and he asks, "Is the time ripe?" This is a question that is being asked in many places and by people in various walks in life. Probably, it may be useful in inaugurating an interesting discussion in the *Journal*.

Motor-Car Imports and Exports.

PROOF of the enormous development that is taking place in the automobile movement in this country is to be found in the figures now available, relating to the imports and exports of motor-cars and cycles during April. To deal first with the imports, no less than 434 cars and cycles were imported into this country last month, the value of the same being returned at £109,587. The value of the "parts thereof" is given as £11,593, so that we get a combined total of £121,180, as compared with £70,513 in March last. Some of

these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised seventeen vehicles amounting in value to £4,499, and £261 of parts, bringing down the net imports in April to £116,420. During the first three months of the current year imports of foreign automobiles and parts in Great Britain have reached a total of £273,695, representing over 1,000 cars and cycles. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to twenty-nine vehicles of a value of £11,533. Of parts the exports attained a value of £569, making a combined total for April of £12,102, as compared with £5,576 in March last. It is satisfactory to find that, so far as the year has gone, that is to say during the four months ending with April, ninety-one British-built motor-cars and cycles have been exported, their value being roundly £30,600.

In Essex.

MOTORISTS passing through Essex, especially on the high road between Romford and Brentwood, have need to be careful, for the police are unnecessarily watchful in that locality, and just before the holidays four drivers of motor-cars who covered the six miles between the two towns named in twelve, fourteen, eighteen, and twenty minutes respectively—according to the police evidence—were fined. The defendants who did not attend at the police court hearing was fined 50 per cent. more for his inattention to the magisterial matinee. Elsewhere in Essex, too, the police have shown their antipathy to motorists, and we would urge readers who intend to investigate the glories of Epping Forest to do so at a moderate speed—not only to avoid bringing discredit upon automobilism, but also to better enjoy the scenery of the district.

THE EARL OF SHREWSBURY AND TALBOT GOING TO A MEET.

Marriages and Motor-Cars.

OFTEN have we recorded motor-car weddings, and recently a newly-married couple, well known in society, departed for their honeymoon on a friend's automobile. A further instance of the utility of the motor-car is furnished by the experience of a Welsh couple about to wed. Two young people of Llangollen had, last week, intended to enter into a matrimonial alliance, and all the preliminary arrangements had been made. The wedding party arrived at the office of the local registrar—only to find that official was absent. The nearest gentleman qualified to act in his stead was at Corwen, many miles away. No train was available, and horses were absolutely worthless in such a contingency. But a motor-car was within call, and at one o'clock the driver set off. Meanwhile, the agitated couple passed an uneasy time, but their despondency was turned to jubilation when, at half-past two, the car returned with another registrar, who tied the knot in the legal time. There have been many converts to automobilism in Llangollen since that event.

Licences for Motor-Bicycles.

A GENTLEMAN in North London, who has just become the owner of a motor-tricycle, has expressed surprise at the local police-court at having to take out a licence for his automobile. When summoned by the Board of Inland Revenue last week he pleaded that he had not had it long, and that he was ignorant of the fact that it was liable to taxation. On being warned, he had taken out a licence; but this did not save him from having to pay a fine of 10s., with 2s. costs. On this point, our correspondent asks if a motor-cycle used by probable customers for trial trips is liable to taxation. Probably, he will find it save much trouble with the Board of Inland Revenue to take out a licence, for they recognise it is very difficult to know where to draw the line. Perhaps some of our readers who have had experience on this point will favour us with their views.

"If he had
had a
gun."

THOSE automobilists who passed through Beaconsfield on the occasion of the Dash-wood Hill climb little knew the risks they ran, and perhaps the party of half-a-dozen who seemed halting between the Saracen's Head and the White Hart when we passed on the return journey may congratulate themselves

shorter time while insufficiently inflated. He points out than an insufficiently inflated tyre rolls in its rim, and soon causes the cover to tear away at its junction with its thickened edge. M. Michelin also advises the careful wiping and drying of covers after running through mud or water before detachment. This will prevent the formation of boils, which are so inimical to the life of a cover, and are often very difficult to repair. A rusty rim tends to rot the canvas and cut the thin portion of the tyre cover where it makes junction with the stiffened edge.

THE Motor Cycling Club will hold a run to Dunstable on Sunday next. Members will meet at Tally Ho Corner, North Finchley, at 10.30 a.m.

THE East Riding Cycle and Motor Company held a two days' show of motor-cars at the Central Hall, Hull, last week their 9 h.p. Viper light car coming in for a large amount of attention.

A MEET of the Lincolnshire Automobile Club will take place to-day (Saturday) at Brigg. Tea will be taken at the Angel Hotel at 5 p.m.

ON the suggestion of Lord Suffield, the Committee of the Automobile Club is making enquiries as to the cost of an enclosure at Goodwood. Motor-cars are forbidden at Ascot during the races.

THE SCENE ON THE FRONT AT BEXHILL ON SUNDAY.

that none of the local Council were about at the time. At the meeting of that distinguished body the other evening one member referred to the running down of a small dog by a large motor-car, and added the declaration that if a dog of his had been similarly mangled and he had had a gun handy he would have marked the driver of the car in such a way as to have afforded complete evidence of identification. Needless to say, after such a declaration from the Chairman, the Council resolved to call the attention of the police to the excessive speed at which motor-cars travelled through the town. This is another instance of the harm that is being done to the movement by those drivers who have little regard for the convenience of others.

The Care of Tyres.

WRITING with regard to the condition of the many outer covers sent to his concern to repair, M. Michelin says that many of these damaged covers are found with the thickened edge, which slips under the overturned edge of the rim, torn away from the cover for a considerable length. M. Michelin complains that many automobilists have not hesitated to ascribe this condition of affairs to bad workmanship and poor material. He, however, denies that this is so, and attributes destruction to the fact that the tyres have remained and been used for a longer or

THE Corporation of Royal Leamington Spa is inviting tenders, specifications, and designs until the 27th inst. for a motor fire tender, capable of carrying six firemen, a light fire escape, 300 yards of hose and other appliances.

IN Mr. Justice Grantham's court last week the case of Reuter v. Pollard was heard, being an action for the recovery of £400 paid to the defendant to build a motor-car. Baron Reuter having given evidence, the jury was directed to give a verdict for plaintiff for £400.

THE Cleansing Committee of the Manchester Corporation are inviting tenders until the 27th inst. for the supply of a motor-wagon. Specifications may be obtained from Mr. G. Plait, Superintendent of the Cleansing Department, Town Hall, Manchester.

THE next quarterly 100 miles trial of the A.C.G.B.I. will be held on June 3rd, and entries should reach the secretary not later than the 31st inst. The route will be via Beaconsfield and High Wycombe to the 52nd milestone from London, and back again without stopping.

MR. H. HEWETSON has undertaken to drive his motor-car 100 miles per day for fifty consecutive days. When the 5,000 miles is completed, he will sell the car by public auction, handing over the full amount realised to the Prince of Wales's Hospital Fund. The trial runs will commence on Monday, the 9th prox., the start being made every morning at 9 a.m. from the Carlton Hotel, W.

The Bexhill Fête.

IN last week's issue we gave preliminary particulars of the interesting series of events arranged to take place on Whit-Monday at Bexhill, under the auspices of the A.C.G.B.I., and hearing that several of the officials of the Club had arranged to start on the preceding Friday, we decided to do the same. The car chosen for the run was our four-cylindere M.M.C., a most satisfactory and silent-running vehicle. A start was made from Shoe Lane shortly after ten o'clock, and the route followed was *via* Westminster Bridge, Crystal Palace, Bromley, Tonbridge, and Battle. This was a foolish diversion, as there was a better, although rather longer, route, *via* East Grin-

kept them in sight until a hill near Bromley was encountered, where we passed them, due, no doubt, to the very large sprockets put on the Gladiator for the purpose of Monday's races.

It was not until near Farnborough that we saw our friends again, where they passed us. The roads had been very greasy, and as "side-slip" is our bugbear, we had travelled at a comfortable speed of about twelve miles an hour. At this point we changed to "third" and instantly began to "move" and pick up the Gladiator again, but as the grease once more became troublesome and our back wheels seemed to have an inclination to change positions with the front, we "slowed" down again.

SCENES AT THE SACKVILLE, BEXHILL, ON SATURDAY.

stead. For once the tram rails were fairly dry, and consequently no inconvenience was suffered, but after getting off the wood pavements the roads became heavy, causing us to travel on our second speed with the engine running alone. At Penge the familiar sound of a motor was heard, and shortly after a 12-h.p. Gladiator passed us. It was minus its usual *tonneau* body, giving the car a somewhat unfinished appearance. The passenger and driver were two neat-looking fellows, in nautical caps and brown suits of a material new to us. We afterwards discovered that the motorists in question were Mr. Gregson and his brother-in-law. They were travelling at a commendably moderate rate, and we

On Pollhill we bespied the Gladiator's passengers off the car, but before we reached them a fresh start had been made, and it was not until the arrival at Bexhill, between four and five, that we saw them again, bespattered with mud and very damp. They had in the interval made a stoppage at Tunbridge Wells for lunch. Our first stoppage was at Tonbridge, where rain was falling, at 12.40, for lunch. Although warmly clad, the dampness and rawness of the air had made us all feel chilly, and we were glad when the host of the "Rose and Crown," in response to our enquiry, informed us that the good old English fare of stewed steak would be "on" at one o'clock. Otherwise there was a nice

larger of cold meats. But Friday was no day for the latter, and so we waited and were rewarded.

The rain, which had begun with a drizzle, had settled into a downpour, and the prospect at two o'clock, when a restart was made, was not of the most inviting. However, being motorists of lengthy experience, we were all prepared—the two ladies included—with suitable garments, and so restarted, feeling, as a matter of fact, much fitter to face the weather than when we had arrived. The rain drove, and seemed half-frozen, as it stung the face, but, as we had to reach Bexhill—grease or no grease—the third speed went in, and we progressed. Riverhead Hill was in a dreadful state of thick clay, and great care had to be exercised in descending it. The same tale could be continued all the way to Bexhill, but we will not weary our readers—suffice it only to

to be moved into line. In each instance the lanes were narrow, and at each side the earth was soft. The traction engines did not want, naturally, to get on to this, nor did we, so very skilful manœuvring had to be indulged in. However, "all's well that ends well," and we duly reached our destination at 3.45. We were all wet and cold—but, the outer garments being removed, and having had a wash, we felt nothing worse than a desire to have a second luncheon.

The scene at the hotel was a busy one. Many motorists had already arrived, and additional arrivals were recorded every few minutes a whole party, from Hampstead, coming down per train. Some did not arrive till nearly ten o'clock; one gentleman driving a 15-h.p. Mors arrived in such a state from the mud that his friends scarcely recognised him. It was, however,

SNAPSHOTS AT BEXHILL ON SATURDAY.

remark that our experiences were varied, between Battle and Bexhill, by striking a hill having a gradient, we should imagine, of one in seven, inches deep in soft clay. On this we were baulked by a wagon with a team of three horses, and again by a restless horse. The consequence was that passengers had to get out and walk, and friendly hands had to "push" to get the car out of the rut into which it had sunk. We saw the hole—not yet filled up—which had been made on our last visit to the Sackville Hotel, and we were in dread lest restless horses should again force us into a like predicament. Then several traction engines were met in narrow lanes—one drawing five wagons laden with stones, and another a complete circus. This latter placed us in an awkward predicament, as the trailers had wobbled all over the road, and had

fortunate for this individual that his extreme length favoured the identification. The weather right up to midnight continued the same—a high wind and a driving rain.

Saturday morning at first broke doubtful but sunshine in conjunction with a high wind, at last prevailed. The steam-roller was early at work, and the officials, with Lord De la Warr busily assisting, were also, after breakfast, engaged in surveying the track, measuring distances, and laying the telephone wire. Cars were buzzing about, and numbers of the public were interested onlookers, the policemen also in attendance being, on this occasion, friends of the automobilists. After luncheon many members and friends arrived, mostly by train. Mr. Mayhew had a comfortable journey on his 20-h.p. Panhard; the Messrs.

Peall (*pere et fils*) came down on the former's 12-h.p. Daimler; and about three o'clock a 60-h.p. Mors arrived—sans nearly everything but motor-cover and inner tube hung on the back, mudguards tied with string, and the driver with a pair of dancing pumps on—the whole appearance of everything being most singular. All day excitement reigned supreme at the hotel; as the various vehicles arrived, the guests congregated at the doors, and questioned the mud-stained passengers of the cars as they appeared, the general opinion being that the state of the roads was most uncomfortable. Mr. Hewetson came in on one of his Benz cars; other old friends also turned up and were warmly welcomed, but the weather again, towards the latter part of the day, was dull and showery. In the evening, in the lounge, the scene was indeed a brilliant one, and scarcely at any Society function could a more striking sight be seen. The hotel was packed with motor folks, who were, of course, more or less known to each other. It was, therefore, not surprising that late hours were the rule, the topical subject of motoring keeping almost everyone up to the "wee sma'" hours of the morning.

Among the cars that had assembled at Bexhill up to Sunday morning we noticed the following:—

Mr. Astell, 9-h.p. New Orleans.	Mr. C. Johnson, 14 h.p. New Orleans.
Mr. Astell, 14-h.p. New Orleans.	Mr. C. Jarrott, 40-h.p. Panhard.
Mr. G. D. Barnes, 6-h.p. M.M.C.	Mr. R. Lawrence, 10-h.p. Miesse (steans).
Mr. Bird, 12-h.p. Panhard.	Mr. Ledger, 6-h.p. Daimler.
Mr. F. H. Butler, 8-h.p. Renault.	Mr. Midgley, 16-h.p. Napier.
Mr. W. S. Booker, 9-h.p. Napier.	Mr. Mark Mayhew, 7-h.p. Panhard.
Mr. Bramson, 50-h.p. Napier.	Mr. Mark Mayhew, 24-h.p. Panhard.
Mr. A. Burgess, 12-h.p. M.M.C.	Mr. McCalmont, 10-h.p. Panhard.
Mr. C. Browne, 10-h.p. Wolseley.	Mr. H. J. Mulliner, 8-h.p. De Dion.
Mr. C. Cordingley, 12-h.p. M.M.C.	Mr. A. F. Mulliner, 8-h.p. Daimler.
Mr. Cornell, 6-h.p. Benz.	Mr. Overton, 10-h.p. Georges Richard.
Mr. Cave, 10-h.p. Panhard.	Mr. C. Peach, 12-h.p. Gardner-Serpollet.
Mr. Crombie, 18-h.p. Daimler.	Mr. E. Pitman, 6-h.p. Daimler.
Mr. C. Chaplin, 24-h.p. Mors.	Mr. W. J. Peall, 12 h.p. Daimler.
Mr. E. Dangerfield, 6-h.p. M.M.C.	Hon. C. S. Rolls, 60-h.p. Mors.
Mr. G. Ducros, 12-h.p. Panhard.	Mr. P. Riviere, 16-h.p. Pieper.
Mr. H. Edmunds, 10-h.p. Daimler.	Mr. P. Riviere, 16-h.p. Pieper.
Mr. S. F. Edge, 16-h.p. Napier.	Dr. Shaw, 7-h.p. Panhard.
Mr. Elliott, 14-h.p. Dechamps.	Mr. Smith, 12-h.p. Panhard.
Mr. C. Friswell, 5-h.p. Baby Peugeot.	Mr. Sowell, 12-h.p. Daimler.
Mr. C. L. Freeston, 7-h.p. New Orleans.	Mr. Campbell Swinton, 12-h.p. Decauville.
Mr. Moffatt Ford, 12-h.p. Decauville.	Mr. Scelentheim, 12 M.M.C.
Mr. R. Fuller, 10-h.p. Panhard.	Mr. J. W. Stocks, 4½-h.p. De Dion.
Mr. Fletcher, 16-h.p. Panhard.	Mr. Warren Smith, 8-h.p. Argyll.
Mr. Gregson, 12-h.p. Gladiator.	Mr. Troy, 4½-h.p. Renault.
Mr. Terry Horsey, 6-h.p. Benz.	Mr. W. G. Wilson, 8-h.p. Wilson and Pilcher.
Mr. Hutton, 15-h.p. Mors.	Mr. Wolff, 12-h.p. Gladiator.
Mr. A. Harmsworth, 40-h.p. Mercedes (and two others).	Mr. Warne, 6-h.p. Daimler.
Mr. Hewetson, Benz.	
Mr. Isengberg, 8-h.p. Panhard.	
Mr. Jones, 6-h.p. Daimler.	

On Monday every train arriving at Bexhill was crowded with sightseers, who came not only from London and the South, but also from the Midlands. Every hotel, too, poured forth a stream of visitors, and hardly any of the residents stayed at home. They all made their way to the "course," and many took advantage of the early morning trial trips to have a look at the most famous vehicles. Between seven and eight o'clock several of the competitors took trial spins, and the curiosity to judge the performances of the flyers was almost as keen as interest in the event itself.

The course was a kilometre (1,098 yards) long, beginning at the top of Galley Hill at the east end of the track. A road about 160 yards, with a decline of about one in twelve, gave the cars a flying start, while 260 yards remained at the other end in which to bring the vehicles to a stop. The course itself was a smooth road of gravel stretching along the shore, a narrow paved walk separating it from the shingle. The road was nearly straight, but the curve near the finish required to be very carefully negotiated. On the ordinary road beside the track spectators had a good view of the sport.

In managing such an affair for the first time it was only to be expected that the programme should be subject to modifica-

tions; but, on the whole, the event was well organised, and the officials are to be congratulated on the way in which the meeting was carried through. Although it was hoped that the heats in the respective classes would be run in the order on the programme this was found impossible, and the spectators were treated to a very varied arrangement. First would come two voiturettes, then a motor-bicycle heat, and, next, a contest for heavier cars. Further variety was given by a trial run on his 40-h.p. Mercedes being allowed Baron Henri de Rothschild, who arrived while the trials were in progress.

Unfortunately, showers were intermittent during the day, but while these spoiled the pleasure somewhat, they did not materially dampen the spirits of the motorists, who are all assured of the success of the first gathering of the kind in this country. Those of the public who inspected the road at the conclusion of the day's proceedings must have been surprised at its condition, for the surface was not ploughed into furrows as would have been the case had ordinary horse-drawn vehicles been driven over the course. A week before at Dashwood Hill, on a dry road, a contest was held, after which the surface showed little evidence of wear; under the more trying conditions of drenching showers an equally good result was observable on Monday—a point we commend to the notice of county authorities.

Below we publish the results of the contests, from which it will be seen that Mr. Dew's 6-h.p. Gardner-Serpollet car covered the course at a speed of 46 miles an hour—being the fastest touring steam car. The Pape cup for the fastest car over the course in the tourist classes fell to Mr. W. G. H. Bramson's 50-h.p. Napier, driven by Mr. Cecil Edge, in 56 2-5 sec. The best time in the racing electric car section was that of Mr. E. W. Hart's 16-h.p. British Electromobile. The absence of an efficient silencer on the 4½-h.p. Soncin racing motor-bicycle led to the prize in that event going to H. Martin on an Excelsior. In the motor-tricycle class V. Lee was disqualified for pedalling beyond the limit mark, but the 8-h.p. De Dion would, otherwise, have been the winner. In the big racing class the Hon. C. S. Rolls beat Mr. C. Jarrott, whose car got into difficulties; Mr. Rolls, however, consented to a second trial, when Mr. Jarrott's 40-h.p. Panhard romped home at a speed of 52 miles an hour, the 40-h.p. Mors which Mr. Rolls was driving being second, despite the fact that the cylinder head joint was leaking. Mr. S. F. Edge was unable to use his fourth speed owing to the shortness of the course, but he guided his 50-h.p. Napier home in 47 sec., Mr. Rolls, on a 28-h.p. Mors, finishing in 45 4-5 sec. Two cups offered to starters covering the kilometre in less than 40 sec. were not awarded. The Mark Mayhew 25 guinea purse was won by Mr. C. Jarrott. During the day M. Serpollet covered the course four times, his fastest speed being 41 1-5 sec. (a rate of 54 miles an hour), a second faster than Baras on a 20-h.p. Darracq in the class for light racing cars under 650 kilogrammes.

After the racing, the competition for the car having the best appearance took place. The procession of cars was very striking, and as the smartness, combined with suitability of dress of the occupants of the car, was an item in the judging, care was taken with the passengers as well as the car. There were nearly fifty entries, the cup offered by members of the House of Commons being awarded to Mr. S. F. Edge.

TOURIST SECTION.

Class F II.—MOTOR-BICYCLES weighing not more than 112 lbs. (nine entries).

	Brake h.p.	Rider.	Time. M. S.
1 Humber	2	Bert Yates.	—
2 Werner	2	E. H. Arnott	1 3½

Class F I. Motor-cycles weighing not more than two cwt. The 4½-h.p. Soncin entered by W. J. Crampton to be driven by Moffat Ford, was disqualified, being overweight.

Class E.—LIGHT VOITURETTES. (seven entries).

Cars weighing less than 10 cwt., with seats for four persons.
Cars weighing less than 9 cwt., with seats for three persons.
Cars weighing less than 8 cwt., with seats for two persons.

1 Baby Peugeot	5	F Lewin	1 30½
2 M.M.C.	6	G. D. Barnes.	—

Class D.—VOITURETTES (twelve entries).

Cars weighing less than 15 cwt., with seats for four persons.

Cars weighing less than 13½ cwt., with seats for three persons.

Cars weighing less than 12 cwt., with seats for two persons.

				M. S.
1	Clement	8	b.h.p. D. M. Weigel	1 14
2	De Dion	8	E. De Wilton	—

Class C.—LIGHT CARS (twenty-one entries).

Cars weighing less than 18 cwt., with seats for four passengers.

Cars weighing less than 16 cwt., with seats for three persons.

Cars weighing less than 14 cwt., with seats for two persons.

1	Gladiator	12	C. K. Gregson	1 8½
2	14-h.p. New Orleans	20	W. D. Astell	—

Class B.—Cars weighing 18 cwt., or more, but less than 25 cwt., with seats for four passengers (twelve entries).

1	24 h.p. Mors	40	R. Bird	1 2½
2	12-h.p. Panhard	15	Yves Le Coadon	—

Class A.—Cars weighing 25 cwt. or more, with seats for four passengers (eight entries).

1	50-h.p. Napier	65	Cecil Edge	56½
2	16-h.p. Napier	24	E. Midgley	—

Class B.—LIGHT RACING CARS, vehicles under 650 kilogs. (five entries).

				Sec.
1	20-h.p. Darracq	25	b.h.p. Baras	43
2	20-h.p. Darracq	25	Gabriel	—

Class S.—SPECIAL 800 KILOGS. CLASS (four entries).

1	30-h.p. Gladiator	30	Mercier	56
---	-------------------	----	---------	----

Class A.—1,000 KILOGS. RACERS (eight entries).

1	Panhard	40	C. Jarrott	43½
2	Mors	40	Hon. C. S. Rolls	44½
3	Mercedes	40	Campbell Muir	48½
4	Wolseley	30	H. Austin	49½
5	Mercedes	40	Baron de Rothschild	57½

No cup was awarded, the time limit being 40 sec. or equivalent to fifty-five miles an hour.

SPECIAL BIG RACERS CLASS OVER 1,000 KILOGS. (two entries).

1	28-h.p. Mors	60	Hon. C. S. Rolls	45½
2	50-h.p. Napier	75	S. F. Edge	47

Cup not awarded, as time limit of 40 sec. was exceeded.

THE 30-H.P. WOLSELEY RACER DRIVEN AT BEXHILL BY MR. H. AUSTIN.

TOURIST STEAM VEHICLES (six entries).

1	6-h.p. Serpollet	20	A. J. Dew	48½
2	Locomobile	5½	Ginder	—

ELECTRIC TOURIST VEHICLES (three entries).

1	City and Suburban	—	J. F. Ochs	1 54½
2	B. Electromobile	—	T. G. Chambers	—

SPEED SECTION.**Class E.—ELECTRIC RACING VEHICLES (two entries).**

1	16-h.p. B. Electromobile	—	Jeal	1 41½
2	Krieger	—	R. W. Wallace	—

Class D.—MOTOR-BICYCLES, weighing over 112lbs (nine entries).

1	Excelsior	2½	H. Martin	1 1½
2	Shaw	2½	S. A. East	—

Chase, on a 4½-h.p. Soncin, was disqualified for not having a proper silencer.

Class D I.—MOTOR-TRICYCLES, weighing under 250 kilogs. (four entries).

1	Eagle	8	R. Jackson	—
---	-------	---	------------	---

V. Lee, on a 8-h.p. De Dion, was disqualified for pedalling over the mark.

Class C.—RACING VOITURETTES, under 400 kilogs. (three entries).

1	Georges Richard	10	J. S. Overton	1 17½
2	9-h.p. James and Browne	12	T. B. Browne	—

RACING STEAM CARS (three entries).

1	Serpollet	120	L. Serpollet	41½
---	-----------	-----	--------------	-----

COMPETITION FOR CARS HAVING THE BEST APPEARANCE (forty-eight entries).

Entered by	Description.
1 S. F. Edge	16-h.p. Napier.
2 W. J. Peall	12-h.p. Daimler.
3 A. C. Harmsworth	20-h.p. Panhard.

AT Marlborough Street Police Court, on Tuesday, Dr. Edward E. Lehwess was summoned for unlawfully exhibiting an advertisement on a motor-car in Hyde Park on April 27th and 29th. Sergeant Pegg, the chief warrant officer, informed the magistrate that the defendant had started on a journey round the world by motor, and therefore the summons could not be served upon him.

THE Street Cleansing Committee of the Glasgow Corporation are in treaty for a motor-van to be fitted with a patent tipping arrangement.

WE are glad to see that the *Lancet* has taken up our plea for the utilisation of motor ambulances in the City of London.

THE King has been doing a good deal of motoring during his Whitsuntide visit to Windsor.

CONTINENTAL NOTES.

BY "AUTOMAN."

It is an odd turn of events that two of the most ancient heroes of France should make a tour of the country, in the guise of statues, on automobiles. It will be remembered that one of the exhibits at the Automobile Show in the Grand Palais, Paris, at the beginning of the year was the equestrian statue of Vercingetorix, mounted on a steam motor-wagon. The Gallic warrior travelled thus by the high roads to his birthplace—Clermont-Ferrand—where the inhabitants patriotically set him in the market square. Now another famous champion, Du Guesclin, has been sculptured by M. Fremiet, and, between now and July next, he will make a journey by motor-car to Dinan, where his habitation will be, even as it was in the fourteenth century.

Now that the "Circuit du Nord" is over the Paris-Vienna race is being talked about in motor-racing circles. Out of one hundred and seven mayors of French localities on the route of the proposed motor race whom the A.C.F. asked by telegram for their opinion as to the advisability of the contest taking place sixty-nine so far have wired back that they are looking eagerly forward to the event, and that they trust they may count on no

his object was to extinguish the flames. Saché was buried on Friday last week, and on Saturday Severo's funeral took place. Both were attended by many members of the Aero Club, and the funeral orations were made by M. de Castillon de St. Victor in the one case, and Count de La Vaulx in the other.

THE Minister of War of Belgium has written a letter to the President of the A.C.B., in which he expresses a desire to follow up in the manoeuvres this year the trials of motor-cars which were begun twelve months ago. He asks for the loan of two cars—one to carry six, and the other to carry four—for the use of the staff. There is no doubt that there will be plenty of suitable cars forthcoming.

AMONGST the disappointments of the "Circuit du Nord" must be numbered the non-appearance of the new Charron-Girardot-Voigt racing car. The race took place really before the makers were ready, and I learn that in a few days' time the C.G.V. will be on the road, with a motor which develops between 50 and 60-h.p., and weighs only 4 kilos. per horse-power. The complete car will, it is said, weigh less than 17 cwt. The cylinders are bored out of cannon steel, whilst the water-jackets are of copper. There is a distinct peculiarity in the frame, in that, instead of being square at each end, the rear end is pointed.

THE DEBRIS OF M. SEVERO'S MOTOR BALLOON IN THE AVENUE DE MAINE, PARIS.

[La Vie au Grand Air.

alteration being made in the itinerary. The A.C.F. is drawing up an itinerary for presentation to the French Minister of the Interior in view of obtaining his authorisation of the race.

MONT CENIS has recently been ascended by a motor-car for the first time, an Italian motorist, Signor Luigi Storero and three friends accomplishing the climb on a 12-h.p. car. They reached the highest point of the pass, 6,800 ft., and stayed the night at the hotel, as a snowstorm had begun. They had a very trying return journey, but succeeded in returning in safety to Turin, where they received an ovation.

LUNCHING the other day at the A.C.F. I met several members of the Aero Club who had studied the sad accident to Severo from the point of view of the indications shown by the remains of the two poor fellows who lost their lives. From the manner in which Saché, the *mecanicien*, was burnt they conclude that something went wrong with the motor, that the spirit took fire from some cause unexplained, and that the flames immediately leapt up the rigging and set the hydrogen in a blaze. This conclusion is arrived at from two facts; first, that the *mecanicien* was burned principally on the chest and face, and not at all on the back; and, secondly, that he was, when burned to death, in the position of a man trying to take his coat off. It is thought that

UNDER the auspices of the Austrian Automobile Club a hill-climbing competition from Neuwaldegg to Exelberg, a distance of 4.2 kilometres, was held on the 11th inst. In the heavy-car category Herr Porsche was first in a Lohner-Porsche combination petrol-electric car, his time being 7 min. 8½ sec. In the class for cars weighing less than 652 kilog. Herr Hieronymus was first in a 12-h.p. Spitz car, the time being 6 min. 52 sec. In the class for cars under 400 kilog. Herr Hrabil came in first on a Locomobile in 8 min. 21½ sec. In the motor-cycle class there were two competitors mounted on similar machines (Laurin and Klement), Laurent being first, time 8 min. 17½ sec.

AN International Motor-car Exhibition, held under the auspices of the German Automobile Club, the Mid-European Motor-Car Union, and the German Motor Traders' Society, was opened in Berlin on the 15th inst. Altogether there are 111 exhibitors, the show being the most important so far held in the Fatherland.

MR. P. HEBDEN, of 133, Woodhouse Lane, Leeds, has taken out a petrol licence, and now holds a stock of Pratt's motor spirit. He also keeps on hand one or two fully charged accumulators, sparking-plugs, De Dion parts, etc.

THE TOOL-BOX.

MUCH of the ease and comfort of motoring, especially on tour, depends on the care and forethought which has been bestowed on that too often neglected portion of the car's anatomy, the tool-box, and a glance at the interior thereof will often give the observant critic much insight into the character of the owner. The too familiar cupboard, in which spanners, oil-cans, wire, loose nuts, and—too often—inner tubes as well, wallow in a marsh of spilt oil, grease, and resin, sometimes has a variant in a clean and neatly-kept receptacle, in which the orthodox set of tools repose in assorted places, but from which all else that could be useful in an emergency has been carefully omitted; nor does it appear that anyone has as yet placed on record what, in his opinion, a well-regulated tool-box ought to contain, an omission deserving an attempt at remedy from more than one pen.

Lubricants will, of course, occupy an important place, and an oil-can and grease injector, with reserve stock of oil, grease, graphite, resin, and French chalk, also a small can of paraffin for valve grinding and lamps, and flour emery, will include most things necessary of this kind, a collection which is, if possible, best kept apart from the tools and replacements, in the interests of cleanliness. Screw-top tins, such as used for vaseline, form the best receptacles, on the whole, for such of these as are solid; but for resin, which is chiefly wanted for brakes, clutches, and the like, an "insufflator," like those commonly vended for distributing "insect powder," is very convenient, and enables it, if finely powdered, to be squirted easily into the refractory part. If belts are used, castor oil or belt dressing should not be forgotten.

Sufficient spanners are generally supposed to accompany a car, a belief that it is not always superfluous to verify, and a large adjustable spanner, and hammer (unless the same tool serves for both) is always wanted, while a smaller one of the "Clyburn" type, most convenient for awkward corners, should accompany it. It is generally necessary also to have another one thin enough to be used on the lower of two lock-nuts, or such, if small, cannot be properly tightened, while some car-builders have a perfect genius for devising nuts in positions where a specially-shaped instrument is needful to tighten them. 'Screwdrivers, cutting pliers, a large file, and a watchmaker's file for coil, will also have their places, and a steel "tommy," and 6in. or 9in. "Footprint" pipe-wrench should be included. If touring in remote regions is intended, it is useful to have a small vice that can be clamped to the step of the car, which need not take up much room, and it is better to have a knife and scissors in the tool-box than not to have them in one's pocket.

Spare parts and sundries will vary with the type of car, but plenty of nuts, bolts, and split-pins should be carried, and replaced as they are used up, which precaution, though obvious, it seems almost necessary to mention, if experience of its neglect is a guide. Spare sparking-plugs, valves, and valve-springs suggest themselves, as also, in some cases, a spare circulating pump, while the necessary plates and bolts for patching up a broken spring are things very inadvisable to omit in the present state of road management. Asbestos sheet and string, and ready-cut packings, along with copper wire—plain and insulated—and cloths and waste, should all be there, and though it is very improbable that any one of all these multifarious items will be wanted on any particular run, like the Yankee's revolver, "when you want it you want it badly." We heard of an ultra-cautious automobilist who included a surgical bandage and plaster in his collection, and found even that come in useful at last—to mend a leaky water-pipe!

Finally, tyre-repairing necessities are a thing apart, and should be kept so, not being improved by rude contact either with tools or oil; and the harmless, necessary voltmeter is safer in the owner's pocket than elsewhere; it is doubtful even whether in the small sizes useful for ignition accumulators it can be safely screwed to the dashboard if it is to retain its accuracy, convenient as that arrangement is.

MANY motor-cars passed through Exeter on Saturday last en route for Torquay and the district further west.

A STORY WITHOUT WORDS IN FOUR CHAPTERS.

—Das Schnauferl, Munich—

THE Brighton and Sussex Motor and Carriage Works have secured the district agency for the Lux cars exhibited in England for the first time at the recent Show.

THE old axiom "A stitch in time saves nine" is particularly adaptable to a motor-car, as many serious accidents might be avoided were a little timely care exercised in keeping the various parts in proper working order.

A NEW drive has been constructed at The Hendre, Monmouthshire, by Lord Llangattock. This entailed much cutting through rock, and will probably be appreciated by the motorists of the family.

THE WHITSUNTIDE MEET OF THE PROVINCIAL AUTOMOBILE CLUBS.

IN accordance with the arrangements made at the conference between the honorary secretaries of the Liverpool, Manchester, and Yorkshire Automobile Clubs, held at Manchester at the end of last month, a joint run of members of the Local Centres of the Automobile Club took place on Saturday last at Buxton. No arrangements were made other than that members should assemble at the Empire Hotel in time for dinner on Saturday evening, and that those running from Liverpool should have luncheon at the Patten Arms, Warrington, shortly

8.30. Mr. Gerald Higginbottom, whose speed round corners on the grease was a revelation, had serious tyre troubles at the summit.

The first car to reach Buxton was Mr. Thornycroft Vernon's 7-h.p. Panhard at 5.30, and the party at Buxton on Saturday evening was as given below:—

Liverpool Self-Propelled Traffic Association:—Mr. Thornycroft Vernon's 7-h.p. Panhard, with Mr. and Mrs. Felix Rosenheim; Mr. Norman Fletcher's 10 h.p. Wolseley, with Mr. W. G. Garnett and Mr. W. Pearson; Mr. Leonard Williamson's 24-h.p. Daimler, "Sapho," with Mr. H. Randle Kay; Mr. J. A. Bradshaw's 6-h.p. Daimler, with Mrs. Bradshaw, Mr. and Mrs. Geo. Jamezon, Mr. and Mrs. H. S. Jackson; Mr. C. F. Boston's

AT THE TOP OF TADDINGTON RISE.

Photo by

after one o'clock. Seven cars from Liverpool joined up here, and completed the run, with the exception of Mr. Boston's 12-h.p. Daimler, which had a burst tyre on one of the driving wheels at Knutsford. The storm delayed the party very much both at Warrington and Macclesfield, Mr. Thornycroft Vernon being the only driver to push through.

The weather, which had been threatening in the forenoon, proved even more unpropitious than had been thought probable the whole party being almost wet through by a tremendous thunder shower at Warrington, and by a second edition which came out shortly after the party left Macclesfield, where a halt was made for tea. The run to Buxton was completed non-stop by all the cars except Mr. Shrapnell Smith's 8-h.p. De Dion. This car was seen stopped two miles below the "Cat and Fiddle," with the driver and passengers looking for a squeaking joint. After an hour's careful examination, the fears that a bearing was heating proved to have arisen only through the scraping of the exhaust-valve spring on the valve stem. At the "Cat and Fiddle" they were again in difficulties from loss of compression through the inlet valve, which required a little grinding in before being in order again; but, notwithstanding these minor delays, the De Dion reached Buxton about

THE ROWSLEY POLICEMAN.

(Mr. Leonard Williamson.)

12-h.p. Daimler; Mr. G. H. Bechtel's 5-h.p. M.M.C. voiturette, with Mrs. and Miss Bechtel; Mr. Shrapnell Smith's 8-h.p. De Dion, driven by Mr. E. A. Rosenheim, with two friends. Manchester Automobile Club:—Mr. W. E. Rowcliffe's 5-h.p. Century tandem, with Mr. A. Noel Smith; Mr. R. C. C. Yates' 2½-h.p. Swift tricycle; Mr. Victor O'Neill's 6-h.p. Daimler; Mr. Gerald Higginbottom's 30-h.p. M.M.C. Yorkshire Automobile Club:—Mr. Walter Jackson's 10-h.p. Daimler, with Mrs. Jackson; Mr. Alfred F. Dougill's 8-h.p. Loidis, with Mr. T. Palmer (arrived on Sunday night). Mr. G. F. Dawson, Manchester, on an 8-h.p. Panhard, and Mr. Bennett, on an 8-h.p. Argyll, returned to Manchester on Saturday evening.

On Sunday morning a run was made to the Peacock at Rowsley, a distance of about 15 miles, and on the home journey a hill-climbing contest up Taddington Rise, between the identical points where records were taken during the 1,000-mile trial of 1900, was arranged. The roads were exceedingly heavy and trying, owing to their chalky nature and the heavy rain, it being almost impossible to avoid side-slips. After running to Bakewell in good form, the De Dion, with four passengers, including the Misses F. and M. Nelson, of Manchester, had the misfortune to charge a bank, and, being minus a starting handle and satisfactory water circulation, was

MR. LEONARD WILLIAMSON'S CAR "SAPHO"
(LATE "LE CHAT NOIR.")

(Mr. W. G. Garnett.)

left at Bakewell until Monday, when the handle and radiator were tinkered up by a local blacksmith, and the car driven back to Liverpool without further mishap.

The following are the records of the hill-climbing contest, and a comparison with those obtained two years ago will be of interest to readers of the *Journal* :—

SPEEDS UP TADDINGTON RISE, 2·522 MILES, WITH A MEAN GRADE OF 1 IN 20.

The tour was successful, though marred by wet weather and the condition of the roads. We learn, by a later advice from our representative, that an executive meeting held on Monday, before the dispersal of the members, decided to arrange a Coronation Run to Harrogate in June.

THE CLEANING OF MOTOR CARS.

FROM the handbook to the Wolseley car, lately issued by the Wolseley Tool and Motor-Car Company, Limited, we cull the following few notes regarding the cleaning of motor-cars, which we feel sure will be read with interest by all motorists :—

Owing to the careless way in which many motor-cars are treated, they have become associated with the idea that they are necessarily dirty, and only fit for those who wish to go tearing around the country. Many owners fail to recognise that their cars are depreciating very rapidly in value by not being properly cleaned. The mud is allowed to dry on the paint and leave spots, instead of being washed off immediately the car has returned to the coach house. The motor gets coated with grease and dust, and the car rapidly puts on a dirty and second-hand appearance. There are others who take a pride in their cars, which, after running many thousands of miles, look almost as well as they did the day they were turned out.

To remove dust from the paintwork a large common painter's brush is as good as anything; but in muddy weather, a soft sponge with plenty of water should be used. The sponge should be plunged frequently into the water and "dabbed" on the mud; do not attempt to wipe it off, as this will scratch the varnish. When every vestige of dust has been removed, the car may be wiped down with a soft chamois leather. Neither the brush, sponge, or leather should touch any greasy part, or they will spoil the gloss of the varnish. Separate cloths or leathers should be used for the motor and the gearing, these parts being finished last, care being taken that no grit or dust be wiped into the bearings. It is almost needless to add that all lubricators, tanks, etc., should be closed during cleaning operations.

A little paraffin oil on the cloths used in cleaning the engine greatly facilitates the removal of any grease. To clean the side chains use the same oil, well brushed in with a common paint-brush. After having removed all the dirt and water from the car, wipe the bright parts with a rag having a little vaseline on it, and give the side chains a coating of tallow and blacklead, which can be kept ready mixed, and applied with a brush similar to that used for cleaning.

All dirt should be washed off the tyres, and having dried them carefully, cuts and bad places should be cleaned out with benzine or petrol, and then plugged and cemented with pieces of pure rubber and solution, so that they may be allowed as much time as possible to harden before being again used. On no account

* Pedalled at parts.

† Fifteen minutes stop to adjust chain.

should a deflated tyre be allowed to support the weight of the car. If it is not convenient to repair the tyre at once, the weight of the car should be taken off it by a jack or other support. There is nothing worse for tyres than to allow them to stand on greasy patches. As it is almost impossible to prevent oil dropping on the floor, it is best to get a sheet-iron tray, about five feet long by three feet wide, having sides about one inch high, and slide this underneath the car as soon as it is brought in.

To describe in detail the best method of cleaning a car doubtless gives an impression that it takes a great deal of time, more than most people could devote to the work, but it is surprising how quickly a motor-car can be cleaned, if the few necessary appliances are kept in readiness for use as soon as it is housed after a run. A little care and time spent in the methodical cleaning of the car in the manner described is more than repaid by the absence of trouble and worry, and the comfort of knowing that all is right beneath one when riding along the road.

A LOW-WATER ALARM FOR STEAM CARS.

A LOW water alarm for use on steam cars has lately been introduced by Messrs. Kennedy and Warren, of 623, Jefferson Street, Toledo, O., U.S.A. It is a float-operated device, the float chamber connecting as usual with the steam and water space of the boiler. The float operates an exterior lever, to which is connected a vertical sliding rod. On the outside of the float chamber is fastened an electric contact spring, a plate of wood fibre insulating the contact spring and its connection post from the chamber. The vertical sliding rod is provided at one point of its length with a projecting pin which, when the water level and the float reach a certain low mark, comes in contact with the insulated contact spring and

thus completes the circuit of an electric bell, which begins to ring and thus gives a warning that the feed to the boiler should be started or increased.

To provide an additional safeguard against accidents due to low water the petrol connection to the burner is brought up to this device and a valve is inserted in it there which is normally held open by the vertical sliding rod, as seen in the illustration. When the water level becomes so low that there is imminent danger of burning the boiler, a drill hole in the sliding rod comes opposite the rod attached to the valve lever, and this allows a helical spring on the latter rod to close the petrol valve, which will immediately put out the fire and prevent the possibility of burning out the boiler.

THE FRENCH ALCOHOL TRIALS.

ON Tuesday and Wednesday of last week the Place de la Concorde, Paris, was the scene of much coming and going of automobiles. At the Jardin des Tuileries, just inside the gates, had been installed a weighing machine with the object of checking the weights of the competing cars in the race organised by the French Minister of Agriculture, with the object of popularising alcohol as a motive power. Crowds of curious persons, amongst whom the leading members of the automobile trade, watched the proceedings with interest. Most of the officials chosen by the Government were members of the Automobile Club, and therein the Government showed a very wise discretion. Of course, the centres of attraction were the new Mors and Panhard cars, and the appearance of Chevalier de Knyff, with the only model of the Paris-Vienna type, caused the greatest excitement. This new car cannot be described otherwise than as a monster. The large cylinders of the motor are cast in steel as thin as possible, in order to reduce the weight, and the water-jacket is made of copper—quite a new departure.

The cooling arrangements of the Motor were evidently defective when I saw the car, for as soon as the stopper was unscrewed from the water reservoir volumes of steam escaped. There is a certain similarity in appearance between this monster and the big Napier car of last year, as the bonnet is of the square flat type. The car altogether gave me a bad impression, and seemed to be anything but ready.

Vanderbilt arrived on Wednesday afternoon on his Mercedes, and I had the opportunity to examine the car closely. It is a marvel as far as execution is concerned; every part of it has a mechanical finish which one cannot help admiring. On Wednesday night a steady drizzle commenced with thick darkness; but, notwithstanding this, crowds of motor-cars, horse-drawn vehicles, bicycles, and even pedestrians trooped out towards Champigny, from which place the cars were to start at four o'clock on Thursday morning. It might have been a repetition of Paris-Berlin last year, except that the weather was colder and the rain falling steadily. The trains to Champigny were absolutely crammed with enthusiasts, and the road through the Bois de Vincennes presented quite a picturesque appearance on account of the Chinese lanterns used by the cyclists. At Champigny every one was making a night of it—all the *cafés* were doing a brisk trade, and *consommations* of every kind were at a premium. Towards four o'clock the rain increased, notwithstanding which there was a constant coming and going along the line of cars prepared for the start.

At the stroke of four the first signal was given, and Rene de Knyff set off on his monster amidst the cannonade made by his enormous motor. There were fifty-six starters, but to the disappointment of everyone, the Mors stable was only represented by Baron de Caters. The light Mors cars had been withdrawn from the contest a few days before the start, and Fournier and Rolls, although at Champigny, turned back and did not start. Various reasons are given for their not starting, but I believe the correct one is that the cars were not really ready, and water was leaking into the cylinders. Soon after the start de Knyff had troubles with his clutch, and with his water-circulation, and fell back from the leading position, being replaced at the head of the list by Maurice Farman, quickly followed by Jarrott. Both of the two last men drove Paris-Berlin Panhard cars, lightened in weight to suit the new regulations, and called the "Nice-Abbazia" model. Baron de Caters soon broke down on his Mors and left the field open. Vanderbilt, on his "Mercedes," was going strong and had a lead, in time, on Maurice Farman, when the key of the chain-sprocket, for some unexplained reason, cut through the metal and literally burst it. It was impossible to repair the damage, and the car was towed back to Paris by Baron Henri de Rothschild, who was not competing in the race, but who happened to be out on his "Mercedes."

At 10.36 Maurice Farman arrived at Arras, followed by Marcellin (on a Darracq) and Jarrott. The next in order, making the time allowance, was Louis Renault on a light Renault car,

followed by Harry Farman on a light Panhard. Osmont was next on a motor-tricycle.

As to the result of the first day's racing in the heavy cars there is little of interest to say, as there was no serious competition, and one cannot judge of the Paris-Vienna Panhard model, which did not run evenly. In the second category Marcellin's performance on a Darracq is remarkable, as he not only wins in his class, but beats all but one in the heavier class. Louis Renault, too, made a remarkable performance, and these two last will give Messrs. Panhard and Levassor food for reflection. In the third class Guillaume made an even more remarkable performance, seeing that his car is under 400 kilos., and the four Renaults, as usual, arrived in a bunch. The scene at Arras was one of remarkable enthusiasm. A special train from Paris, chartered by the Government, and having on board, in addition to the celebrities of the automobile world and the press, M. Jean Dupuy, Minister of Agriculture, reached Arras at 10.10 a.m., and there was barely time for the occupants to reach the control before Maurice Farman arrived like a whirlwind.

Out of a total of fifty-six starters only thirty-six cars reached Arras, and on the following morning thirty-three lined up for the start. The morning was cold and cloudy, with a strong west wind blowing, and occasional showers. Notwithstanding the bad weather and the early hour of the start—4 a.m.—the whole town was alive to see Maurice Farman depart. All along the route crowds turned out to see the cars pass, although it rained in a pitiless manner. Through Doullens, Saint-Pol, Saint-Omer, Boulogne, Abbeville, and Dieppe Maurice Farman led, followed by Marcellin and Jarrott. Louis Renault broke his pinions at Doullens and had to give up; his brother Mareel skidded and smashed a wheel in Boulogne. Jarrott was hard pressed by Edmond at Abbeville, but slipped away from him at Dieppe. All along the road through Gournay-en-Bray, Gisors, Vernon, and Mantes Maurice Farman led, followed by Marcellin and Jarrott, who had a neck and neck contest all day. All the drivers were plastered with mud from head to foot, and were almost unrecognisable.

At St. Germain the winning post was fixed at "Hennemont" Gate, on the "Quarante-Sous" road, and there a large concourse of *chauffeurs* gathered, notwithstanding the awful weather. Amongst the spectators I noticed the Baron von Zuylen, the Marquis de Dion, Messrs. Darracq, Michelin, Bouton, Emile and Louis Mors, Clement, Fernand Renault, the Brothers Longue-mare, Dechamps, Journu, Henri Deutsch de la Meurthe, etc.

At 1.5 Maurice Farman loomed out, one may say, almost through the muddy dust, for although the roads were completely soaked, the speed of the car still managed somehow to get it through the mud and raise some dust. One of the springs of the car was broken, and he had done nearly the whole day's run with it in this condition. At a few minutes before two o'clock two cars appeared close together, and a most exciting finish took place between Jarrott and Marcellin. Jarrott came first, but so closely pressed was he by Marcellin that the cars were almost touching. Jarrott found himself in a most difficult position owing to the crowds in front and the other car at his heels; an injudicious police commissioner who rushed forward at the last moment was brushed aside, whilst a policeman fainted with excitement. All ended well, however, and Jarrott has the honour of holding the second place in the race. Only nineteen competitors out of 56 starters arrived.

The following is the classified result of the two days' running, subject, of course, to verification by the judges:—

PARIS-ARRAS-PARIS (845 kilometres) 526 miles.
Cars weighing from 650 to 1,000 kilos.

Name.	Make.	Net Time.
		H. M. S.
1. Maurice Farman ...	40-h.p. Panhard	12 1 52½
2. C. Jarrott	40-h.p. "	13 9 12½

------------------	----------------------------	-----------

In the first category only Panhard and Serpollet got through, and although in speed Panhard has the victory, Serpollet has made the record of the class and of the whole competition. Out of all the competing firms Serpollet alone got all his cars safely over the whole course. In the second category (the light cars) Darracq scored an easy win, beating the Paris-Berlin Panhards. Out of seven starters from Paris, however, only two arrived at the winning post, and from what I can learn the principal cause was the taking of bends in the road at too high a speed. Déchamps is to be congratulated in having the only foreign car which got through. Renault won the third category three times over, but strangely enough both of the brothers Renault broke down and abandoned the race under most unlucky circumstances.

The consumption of fuel trial took place on Thursday, Friday, and Saturday over a distance of 730 kilometres (454 miles) in the following stages—Paris to Arras, Arras to Abbeville, and Abbeville to Paris. The start was made from the A.C.F., on the Place de la Concorde, at 8 a.m., when forty-seven cars lined up for the competition, and only three failed to reach Arras. On Friday morning the forty-four remaining cars started for Abbeville. The weather was simply execrable and the conditions the worst possible for motor-cars, which are certainly not built to plough through seas of mud against a head wind. Skids and mishaps and general discouragement of the awful weather seriously thinned the ranks, and only twenty-four cars persevered and reached Abbeville. Saturday's weather was even worse than Friday's, and the twenty-four cars left in the competition started off from Abbeville after six o'clock in the morning, the occupants needing all their courage to face the ordeal. The competition ended at the premises of the A.C.F., on the Place de la Concorde, and, through the pitiless beating of rain, amongst a gathering of enthusiasts, I watched the Baron de Turckheim arrive first at 3.14 p.m. on a De Dietrich. All the afternoon and evening the rain continued until about eight o'clock when the clouds cleared away and the moon shone out, only however to glisten on oceans of mud. At 9 p.m. eighteen out of twenty-four competitors had arrived.

AUTOMAN.

A KILOMETRE competition was held at Antwerp a few days ago. In the heavy car section, Baron de Caters was first on a 50-h.p. Jenatzy.

AN electrical service wagon has lately been acquired by the fire brigade authorities at Stettin, Germany. The vehicle, which was built by a local firm, has seating capacity for four men, and is fitted with stand pipes and 100 metres of hose. It will run about sixty kilometres on one charge of the batteries, and can attain a speed of 12½ miles per hour.

MADAME LOCKERT, of *Le Chaffeur*, Paris, has sent us a set of illustrated picture postcards that she has recently issued. The pictures all relate to automobile subjects, and include M. Serpollet on his first steam tricycle built in 1887, and the Count De Dion on a steam tricycle constructed in 1883, and also on one of the 1902 model De Dion cars.

PETROL AS FUEL FOR EXPLOSION MOTORS.

BY CAPT. E. C. LONGRIDGE, M. INST. MECH. E.

THE value of petrol as fuel for explosion engines presents an interesting problem. Unfortunately, owing to the insufficient data now available, the true efficiency of various mixtures cannot be accurately determined. A few years ago Dr. Boverton Redwood contributed some valuable information on the subject. The results of his experiments, tabulated in "Transport of Petroleum," are as follows:—"With seven volumes of the liquid (pentane and gasoline) to 100,000 volumes of air, the combustion is a silent one; while, with four times that proportion of liquid, the mixture also burns without explosive violence. With between 8 and 9 volumes of liquid to 100,000 of air, there is a marked increase in the energy of the combustion; and, when the quantity of liquid is augmented to 10·5 volumes, a sharp explosion occurs. When the proportion of liquid is increased beyond about 17 volumes, there is a perceptible decrease in the violence of the explosion, with corresponding gain in the volume and duration of the flame; and, with 21 volumes of liquid to 100,000 of air, the explosion is as mild as with 8·4 volumes." These results, adequate for Dr. Redwood's purpose, are not sufficiently comprehensive for the requirements of the motor manufacturer. For his purpose, estimation of the value of any explosive mixture involves knowledge not only of the maximum explosion pressure as one factor, but also of the rates of cooling, as another factor. For gas mixtures, these data have been experimentally determined by Mr. Dugald Clerk (see "The Gas and Oil Engine"). The consideration of a few of these results will illustrate what remains to be done—mixtures with petrol, alcohol, etc. Taking one cubic inch of Glasgow coal gas, with cylinders of such areas that the depth of mixture, in every case, would be one inch, the maximum explosion pressures for various mixtures were:—

	Vol. 1/4 ..	Vol. 1/2 ..	Vol. 1 1/2 ..	Vol. 4 ..	Vol. 8 ..
Proportion of gas in mixture ..	1/4 ..	1/2 ..	1 1/2 ..	4 ..	8 ..
Lbs. pressure per sq. in. on pistons, 14, 12, 10, 8, 6, sq. in.	728 ..	756 ..	690 ..	712 ..	576

These figures show that the mixture of 1 1/2 gas gave the highest pressure, thus determining the first factor. To obtain the second, it is assumed that the duration of the gas engine stroke is roughly 0·2 sec. Mr. Clerk's diagrams indicating the fall of pressure—that is, the rate of cooling, during 0·2 sec. from complete explosion—gave the following results:—

	Vol. 1/4 ..	Vol. 1/2 ..	Vol. 1 1/2 ..	Vol. 4 ..	Vol. 8 ..
Proportion of gas in mixture ..	1/4 ..	1/2 ..	1 1/2 ..	4 ..	8 ..
Time, 0·2 sec. after max. pres. ..	0·48 ..	0·38 ..	0·33 ..	0·27 ..	0·25
Lbs. pressure per sq. in. ..	43 ..	48 ..	47 ..	55 ..	57
Pressures on pistons as before ..	608 ..	576 ..	470 ..	440 ..	342

By adding the two factors—power of producing pressure and capacity to resist cooling—we arrive at the mean pressure which determines the true efficiency of the mixture:—

	Vols. 1/4 ..	Vols. 1/2 ..	Vols. 1 1/2 ..	Vols. 4 ..	Vols. 8 ..
Proportion of gas in mixture ..	1/4 ..	1/2 ..	1 1/2 ..	4 ..	8 ..
Max. pressure on pistons, as above ..	728 ..	756 ..	690 ..	712 ..	576
Pressure on pistons after 0·2 sec. ..	602 ..	576 ..	470 ..	440 ..	342
Mean pressure ..	665 ..	666 ..	580 ..	576 ..	459

It is the determination of these factors for mixture of petrol, etc., that is still wanting. It is, however, likely that the deficiency will soon be supplied, for the writer is in a position to state that the necessary experiments are now in progress. The results will be awaited with very considerable interest, and there is little doubt that they will establish the value of petrol measuring devices for carburettors where efficiency and economy are rigorously followed.

THE Motor-Car Exhibition at the Agricultural Hall.

FIFTH NOTICE.

THE SCENE IN THE YARD.

THE "Kitto" motor-bicycle was shown by Mr. W. H. Kitto. The main features of this machine were described in our issue of December 7th last, and only a brief summary need now be given. The motor is placed on the lower tube near the head of the machine, the weight resting mainly on the front wheel. For the ordinary trembler in connection with the ignition there is substituted a forging that the maker claims cannot break, while special attention has been given to the position of the contact and the platinum points to prevent the former becoming fouled with oil, and the latter loose from vibration. A vaporiser is provided, by means of which the air and gas are mixed automatically. An automatic lubricator to carry a supply sufficient for a run of a hundred miles is provided, and the petrol tank will contain sufficient for a ride of seventy-five miles when the rider has become accustomed to the machine. The Kitto motor-bicycle has all its levers controlling the mechanism so placed that the rider can operate them from the saddle.

In the Gallery the London Motor Garage Company, Limited, had a stand from which they were able to draw attention to the facilities they possess for storing, washing and cleaning motor-cars. For an inclusive quarterly, annual, or other subscription, owners of cars can have their vehicles housed in Westminster, from whence they can be delivered to any address, ready for use, when desired. The Staunton speed indicator for motor-carriages, described in our columns on February 1st, was shown on the stand. This instrument enables motorists to tell at a glance the speed at which they are travelling. It registers the total number of miles travelled, and also the rate of speed, at any moment, up to 30 miles per hour. The instrument further registers automatically the maximum speed travelled during each 110 yards, so that on stopping, the dial shows the highest speed reached in the last 110 yards run. An attachment can be added to the dial recording the highest speed reached during each 110 yards, so that the pointer can be reset at zero, at the option of the driver. The indicator is enclosed in a strong metal case with clip for attaching to the car. It is put in operation by means of a self-containing gear fitted on the hub of one of the front wheels of the car, with which it is connected by means of a length of flexible steel shafting. Petrocene—a new fuel for motor-cars—was also brought to public notice at the stand of the London Motor Garage Company. A current of air is passed over a substance in the form of pebbles which is saturated with Petrocene, with

the result that oxidation takes place, and a hydrocarbon gas is discharged which possesses heating, lighting, and explosive qualities. It was suggested at the stand that an automobile carrying six gallons of Petrocene in this form would be able to travel double the distance that would be possible with liquid petrol.

At the stand of Messrs. H. W. Van Raden and Company woven-glass accumulators were shown. In these the active material is firmly held by the woven fabric, and cannot become detached from the electrode to cause short circuit or self discharge. Each electrode is wrapped in a sheet of spun glass, through which the electrolyte has free circulation. All plates are packed firmly together, making the whole a solid yet flexible mass, free to expand during the charging, and in which the plates of opposite mark cannot get into touch with each other. At this stand our attention was drawn to a Planté positive plate which the firm is making for electrical vehicles. In these plates square sections are connected together by stout lead rims, the sections being of very thin strips separated by a sort of paper which dissolves during formation. It is claimed that a very large effective service is thus ensured, and in the finished batteries the plates are combined with light pasted negatives. The weight capacity of the finished cell is about eight watt-hours per pound of cell—a very good result with Planté positive plates. Other exhibits at this stand included induction coils fitted with Carpenter's patent high-speed tremblers, an improved frictionless contact breaker, sparking plugs of various types, accumulator charging boards, electrical measuring instruments, cut-outs for charging cells, carburettors, etc. A two-cylinder voiturette engine and a slow speed sparking dynamo of the magneto type, designed to do away with the presence of batteries on cars, by giving a high tension jump spark even at the slow speed of revolution that is obtained when the engine is started by hand also attracted notice.

The exhibit of the Motormobile, Limited, comprised a couple of 7-h.p. cars with *tonneau* bodies and a 10-h.p. chassis, the arrangement in both types being to all intents and purposes identical. The cars, which are to be known as the Motormobiles, are built in accordance with the designs of M. A. Vilain, of Paris, and are such a radical departure from the usual practice that we hardly know which point to take up first. The frame of the car is built up of steel and ash. Supported in a central

line with the flywheel, about the middle of the frame (Fig. 132) is a horizontal single-cylinder motor having a water-jacketed cylinder 100 mm. diameter by 110 mm. stroke and developing 7-b.h.p. at a normal speed of about 900 revolutions per minute. Two large heavy fly-wheels are employed, the connecting rod passing between these after the manner of the ordinary De Dion engine. The two heavy flywheels are simply covered by a light metal guard. No enclosed crank chamber is fitted to the engine, the cylinders and connecting rod bearings being lubricated by a special device referred to below. Electrical ignition is adopted, a new departure being that this and the exhaust valve are not actuated off a special two-to-one shaft, but by a small half-speed intermediary shaft in connection with the transmission mechanism. The cylinder lies forward of the crank shaft, and the horizontal exhaust valve is on the right-hand side of the explosion chamber, the inlet valve being above. A half

FIG. 132.—PLAN OF "MOTORMOBILE" CAR.

compression arrangement, operated by a pedal, is provided; another half-speed shaft on the left side drives a cam shaft running parallel with the cylinder to the head; this shaft terminates in a crank pin, operating the special diaphragm pump carburettor which supplies the petrol to the induction valve. The carburettor used is on exceedingly novel lines, as not only will it work, without any alteration, with petrol or alcohol or a mixture of either, but it is claimed to act equally well with a mixture of petrol and ordinary paraffin, or with one of alcohol (methylated spirit) and paraffin, so that there is little likelihood of a motorist being hung up on the road owing to lack of fuel. The carburettor consists practically of a diaphragm pump, which sucks in a certain amount of petrol, the quantity allowed to pass being regulated as desired. A general view and details of the carburetting device are shown in Figs. 133 and 134. It comprises a circular box, one face of which is flexible, like the bottom of an oil can. A pusher operated

by lever connections off the engine, and of which the extent of movement can be regulated, strikes the flexible face of the box at the necessary intervals. To the right, Figs. 133 and 134, is seen the petrol pipe, terminating in a small chamber in which is a small valve opening in one direction, and to which a gauze-fitted air-inlet is fitted. To the top of the box is connected

FIG. 133.—THE "MOTORMOBILE" CARBURETTOR.

another pipe terminating in a small chamber in which is another small valve which acts in the opposite direction to the one referred to above. When the pusher strikes the flexible face of the circular box, a charge of mixture is forced through the valve into the admission pipe connected to the explosion chamber of the motor. When the pressure of the pusher on the flexible face is released, the latter assumes its normal position, and in so doing opens the valve in the right hand chamber and allows another charge of petrol or alcohol to pass into the mixing chamber. The richness of the mixture is varied by the degree of movement allowed to the pusher on the flexible face, no throttling on the inlet pipe being necessary. In connection with the pusher is a hit-or-miss governor which comes into action when the

FIG. 134.—THE PARTS OF THE "MOTORMOBILE" CARBURETTOR.

engine tends to race, preventing the pusher from acting, and so stopping further supplies of spirit or explosive mixture until the speed of the engine has again reached the normal. An "accelerator" is provided, by means of which the governor can temporarily be put out of action. A handle on the steering column regulates the petrol feed. The

next novel feature found in the car under notice is connected with the water circulation of the motor; no pump is employed, a thermo-syphon system taking its place, in conjunction with which the Vilain radiator is employed. The radiator itself is made of thin flat tubes having a rectangular section about 1 in. by $\frac{1}{4}$ in., arranged alongside one another in a frame, with their narrow edges forward, a corrugated strip of metal serving to increase the radiating surface being inserted between them. The radiator is not intended to be full of water when in use, the normal level being but a short distance above the bottom. In fact, the amount of water put in is only about 25 per cent. in excess of that required to fill the cylinder-jacket. The radiator is used as a steam condenser, the object being to maintain the combustion chamber constantly at the temperature at which the motor works most economically. A safety valve is fitted to the radiator. The latter is hermetically sealed, with the result that the firm claim that there is no loss of water, and that it is not necessary to replenish the supply for a long period. We next pass to the transmission mechanism, which is adapted to give two speeds ahead, controlled by a lever under the steering wheel and one reverse actuated by a pedal. Here, again, the arrangement is on novel lines. Each flywheel is mounted on a shaft, one extending to the right and one to the left. Very long bearings are placed on each side of the two flywheels, and these continue nearly to the side chain wheels conveying the power to the rear road wheels. Alongside and parallel with these bearings are short second shafts, each of which forms a half-speed shaft, serving, as also mentioned, to operate the exhaust valve and ignition gear, as well as forming parts of the transmission, being driven by spur gearing from the engine shaft. Another pair of spur gears is fitted outside each of the gear wheels above mentioned, the two pinions on each half-speed shaft being rigid with one another. The chain wheels are formed in one piece with sleeves which normally run free on the engine shaft; these wheels can either be made rigid with the motor shaft or with the reducing gear, formed by the gear to and from the half-speed shaft, which gives a total reduction of 4 to 1. This double two-speed gear (there being one set for each chain sprocket) is brought into action by means of novel two-way metallic cone clutches, which run in entirely closed chambers on the extremities of the engine shafts (see Fig. 135). Without a drawing it is almost impossible to describe these clutches; but it may be stated that they are metal to

FIG. 135.—THE "MOTORMOBILE" CRANK SHAFTS AND VARIABLE SPEED GEAR.

metal and run in oil, the latter permitting them to be brought into action without jerk, as, until all the oil is squeezed out from between the two surfaces, a certain amount of slip takes place. It will be seen from the foregoing that there is a separate transmission to each driving wheel, placed on each side of the motor. The reversing gear, which is somewhat similar to a differential gear, is fitted outside the clutch box on the right-hand side of the car, and allows the right-hand wheel to be driven backwards when required. Another special feature of the Motormobile cars is that there is no differential gear of the usual kind, the grip of the road wheels in turning a corner being con-

sidered sufficient to permit one or other of the friction clutches to slip the necessary amount. A special form of lubricator is mounted on the engine. It comprises a small oil receptacle, in the bottom of which is a rod, rotated, when the engine is in motion, by skew gear off the ignition shaft. In this rod five small recesses are formed; these, of course, fill with oil, and as the rod rotates the oil is emptied from the receptacles each into its respective pipe, leading to the engine cylinder, piston rod head, and other bearings. In this way each of the working parts is continually given, in small regular doses, a sufficient quantity of lubricant so long as the engine is working, while when the motor stops all lubricating oil is automatically shut off. Provision is made, however, that before starting the engine a small quantity of oil can be allowed to flow to the

FIG. 136.—DETAILS OF "MOTORMOBILE" SPECIAL HUB BRAKE.

necessary parts. Double-acting band brakes, operated by pedals—all first disengaging the clutches—are fitted to the engine shaft and to the hubs of the rear road wheels. The latter are of a special kind, being arranged to brake the back wheels in proportion to the speed of the car—that is, the greater the speed the greater the friction that can be put upon the wheels. The arrangement is illustrated in Fig. 136; the interior of the hubs is contrived so as to form the male portion of a friction clutch. On the axles are mounted loose sleeves, having on their outer ends the remaining halves of the clutch. The sleeve has a spiral groove, in which a pin, connected with the brake pedal, can move, so as to bring the two parts of the clutch into action. That part of the clutch formed with the sleeve cannot rotate, as it is connected to a band brake on the drums bolted to the wheels; the result is that the greater the speed of the wheels, the tighter the band is drawn on to the drum without any strain on the driver. The brake lever is, of course, so arranged as to bring the two halves of the clutch slowly into engagement. It should be mentioned that below the engine and transmission is mounted a wire-gauze guard to prevent mud and dirt being thrown up on to the working parts. Steering is controlled by an irreversible hand-wheel; instead, however, of the irreversible gear being placed below, it consists of a screw thread on the top of the column, immediately below the wheel. The action of moving the wheel is to screw it upwards or downwards, and this motion is transmitted to the steering wheels. The portion of the column which forms the nut is made in two pieces, with a thin joint between, and thus any back-lash can be taken up. The frame is supported by springs on artillery type wheels 28 in. and 32 in. in diameter, shod with pneumatic tyres. As will be seen from the foregoing description, the Motormobile cars were certainly among the most novel in the Exhibition, and we shall watch with interest their behaviour in actual work in this country.

At the stand of the Kingston Motor and Cycle Company was shown a F.N. motor-bicycle, a 7-h.p. motor delivery van, a Peugeot quadricycle, and a 12-h.p. Boyer car. The delivery van has a two-cylindered air-cooled Sirène engine with piston rods working on to a single crankshaft. Three speeds and a reverse are provided, a Cardan shaft transmitting power to a balance-gear axle. Although not introduced by the Kingston Cycle and Motor Company, a novelty in acetylene lighting was shown on their stand. In this the carbide is employed in a powdered form, and the pressure of the gas regulates a valve through which the carbide is fed. The powder drops on to a deliquescent material, which yields up its moisture to the powder on contact. When this material is all used up, a mere powder is left, which may be thrown away and replaced by a fresh charge. In the "Autolite" motor-car lamps no water is needed, and it is claimed that there is no waste of carbide or carbonisation of burners.

Two different types of car, both known as the "Beaufort," were shown at the stand of the Regent Automobile Company. The 6-h.p. two-seated car (Fig. 137) is driven by a 6-h.p. vertical water-cooled motor, set under a bonnet in the fore part of the frame. The cylinder is 90 mm. diameter and the stroke 110 mm., the normal speed being 800 revolutions per minute. The water-circulation is on the thermo-siphon system, no pump being used. The ignition is effected by means of a Bergmann magneto-electric machine, of which a description was given in the *Journal* a few weeks ago. Two speeds forward and a reverse motion are provided, controlled by a lever on the inclined

FIG. 137.—THE "BEAUFORT" TWO-SEATED CAR.

steering column. From a pulley on the engine-shaft a single belt drives on to one of three pulleys (high and low speed and loose pulleys) at the rear, the sleeve upon which the low speed pulley is set, and the shaft upon which the high speed pulley is fitted, carrying pinions meshing with spur-wheels surrounding the differential gear on the live axle. The second car was a three-seated spider with 8-h.p. engine; the single cylinder has a diameter of 100 mm., the stroke being 100 mm. Three speeds forward and a reverse motion are provided by means of a Panhard-type gear, the arrangement of the transmission in this car being on the lines of the Renault and Darracq, a universally-jointed shaft and bevel-gearing connecting the gear-box with the rear live axle. The Regent Company also exhibited the "Williams" tyre, which has already been dealt with in our columns. It is a solid rubber tyre having a flat hole lengthwise near the base. Into this hole fits a beaded-edged band, the ends of which are drawn together by an anchoring screw in a tubular-screwed sleeve, passing tangentially through the felloe in order to hold the tyre firmly to the rim. By means of this device the tyre is readily detached and securely attached to the rim. Samples of the Compin spring seats for motor-cars were also displayed. These are broad thin springs, fixed across the seat frame or back rest; they are fitted to a bolt at one end and a slot in the woodwork at the other, and as the end on the bolt is loose they "give" readily to pressure and maintain their shape.

An interesting display was that of the Auto Machinery Company, Limited, which included accurately-finished Whitworth nuts, studs, and bolts, ball bearings made of crucible steel, steel valves, and a special valveless circulating pump, of which we give an illustration. A roller-bearing arrangement driven by a Verity electric motor was also on view, being kept running at 1,350 revolutions a minute, carrying a load of 1 ton. It was 1 inch in diameter and 2 inches long, the rollers being made of cast steel. The outer bush, which carried the weight was of hardened steel. The rollers were held in a catch made with gunmetal ends, the latter being held together by steel pins. A 2-h.p. petrol motor was also on the stand. This was fitted with magneto ignition. A ball-bearing axle head and a hub of new design were also shown, together with specimens of their castellated nuts. The "Auto" valveless circulating pump for motor-cars is made of gunmetal. The complete weight of the small size is 2½ lbs., and the capacity three gallons per minute at 600 revolutions. A larger size is also made which weighs 6 lbs., the

capacity of which is six gallons per minute at 600 revolutions. As will be seen from Fig. 138 the pump is a valveless one, the makers claiming it to be not only simple but efficient, there being only two moving parts and no valves to stick.

In the Minor Hall the British Power, Traction, and Lighting Company, Limited, had a large display of eight steam carriages made under the Serpollet patents. Of the vehicles on view, five were of 12-h.p. and two of 6-h.p., the measurements of the cylinders being respectively 75 mm. bore, by 90 mm. stroke, and 65 mm. bore, by 72 mm. stroke. The engines have each four single-acting cylinders, the valves being of the mushroom type, which work efficiently at a speed of as high as 600 revolutions per minute. As the crank shaft is set at quarter sections, it follows that one or other cylinder is always in action. The reverse is obtained by bringing into play a separate set of cams to operate the valves at exactly opposite times to the cams used in the forward drive, and these cams are mounted upon a sliding shaft, actuated by a short reversing lever near the steering wheel. The cylinders are arranged in twin-tandem form, the crank shaft being placed between each pair, and carrying outside the case a chain wheel, whence the power is transmitted by a chain to a chain wheel surrounding the balance gear on the live driving axle. The ratio of gearing is about three or four to one, as desired. No variable gearing is employed, as the efficiency of the engine is constant at either high or low speeds. The steam is produced in a generator, not a boiler, a fact on which the company lay particular stress. It consists of a series of thick tubes bent in gridiron fashion and arranged in layers. The efficiency of this arrangement is one of the surprising features of the system, as it is claimed to be capable of raising 600 lbs. of steam from cold water in six minutes, and maintains this pressure continuously as long as it may be necessary. The water is pumped into the generator as required for any speed or power, the amount being under the complete control of the driver and regulated by a series of cams giving a different length of stroke to the pump at different speeds. The same applies to the supply of liquid fuel. No water is ever contained within the generator unless actually vapourised. Thus, on returning from a run, the driver has only to turn off the water and fuel taps. The various tubes of the generator will, it is claimed, stand for upwards of 10,000 miles, and are easily and cheaply replaced at any time. The 6-h.p. cars are provided with water tanks of a capacity of 8 gallons, and the 12-h.p. with 10-gallon reservoirs, these quantities being sufficient to run the

FIG. 138.—THE "AUTO" WATER-CIRCULATING PUMP.

respective cars 75 miles. Ordinary paraffin is used as fuel, and one gallon will run the car for 10 miles on a give-and-take road. Powerful brakes are fitted, two of the band variety acting on the hubs of the driving wheels, a pair of spoon brakes being also provided to lock the wheels when the car is stationary. The chief improvements and modifications in the 1902 models comprise a ratchet-driven lubricating pump inside a small oil case, and a much larger stepped cam, running at a slower speed, for operating the fuel and water pumps. A new safety valve, similar to an ordinary force pump, is also fitted; it has a pair of strong springs,

one on each side, which hold the plunger normally in position. The cylinder of the pump is connected with the boiler so that the plunger is forced out as the steam pressure increases. When forced out a certain distance it comes into contact with a trigger, which it lifts, and this immediately allows all the water to run out of the generator tubes. A small nozzle on the left side of the dash-board is also connected by a Bowden wire to this same trigger, so that any steam may be let out of the boiler when the car is being left unattended. The stepped cam, which operates the two-feed pumps, and which gives these a variable stroke, as required, is driven by spur gearing from the engine shaft, and is in this way geared down. Its diameter is much larger than formerly, and this, combined with slower speed, should allow the pumps to work with greater regularity, and also prolong their life. In the larger models an improved arrangement is introduced, whereby the stepped cam is entirely abolished, and a gradually variable stroke is given to the pumps by the sliding action of a block in a rocking quadrant. To enable the engine and boiler, as well as the general arrangement, to be inspected, the company also showed a complete *chassis* (Fig. 139), which was conveniently arranged, so that the engine could be run by compressed air. Bodies

least a *chassis*, by means of which visitors to the Show were able to inspect the details and general arrangement. As the latter is the same in all the vehicles shown, the following description may be taken as applying to all. The frame is of tubular construction, cross tubes being introduced to give the necessary rigidity. The whole of the frame is in one horizontal plane, and is built solid with all the necessary brackets for carrying the various parts. The engine, of which a sectional elevation and plan are given in Figs. 143 and 144, is of the single cylinder horizontal type, the explosion chamber being at the front end of the car. The cylinder has a diameter of about 5 in., and a stroke of $5\frac{1}{2}$ in. The cylinder is cast in one piece with its water-jacket and head. Both the inlet and the exhaust valve can be taken out by removing a single nut and a bridge piece. The stem of the exhaust valve projects downward beneath the cylinder, and is operated by a rocking arm from the cam shaft. The crank chamber, which is made of aluminium, not only encloses the crank shaft, but also a longitudinal shaft which is driven from it by bevel gear, and which projects forwardly to form the cam shaft and rearwardly to the main clutch C. This shaft is driven at one half the speed of the engine shaft, and it carries inside the crank chamber a centrifugal

FIG. 139.—PLAN OF GARDNER-SERPOLLET STEAM CAR.

to any design can be fitted, but on the stand were a 6-h.p. double phaeton, a 6-h.p. torpedo-fronted two-passenger car on racing lines, a 12-h.p. double brougham to seat six persons, a 12-h.p. landaulette, a 12-h.p. char-a-banc sporting car, a 12-h.p. *tonneau*, and a 12-h.p. special car with body somewhat between a *tonneau* and a phaeton. The 12-h.p. *tonneau* has been designed as a shooting carriage to carry nine passengers. It is fitted with a canopy extending the whole length of the car, from which hang waterproof curtains, whilst the back and front of the vehicle are protected with bevelled glass panels. Altogether, this company had an interesting display of cars, the only fault that we can find being that the stand was somewhat overcrowded to enable the vehicles to be attractively arranged.

A relatively new type of car to the English market, but one which has, we may say, won its spurs in France, is the Gillet-Forest, which is being introduced into this country by Messrs. Vaughan and Brown, Limited. Their exhibit comprised a well-appointed Victoria of 8-h.p., a 10-h.p. *duc tonneau* in natural wood, a 8-h.p. traveller's brougham, adapted for carrying a large quantity of samples, a light delivery van fitted with an 8-h.p. motor, and intended to carry loads up to 15 cwt., and last but not

governor and a long, sliding and tapered exhaust cam J, on which works a roller K. This piece performs the office of a regulator or governor; it acts on the exhaust valve by means of the rocking shaft L, which raises the valve by means of an arm M for a variable length of time. When the motor runs at the normal speed the governor spring keeps the highest part of the cam J in line with the finger K. If the speed rises the balls I recede from each other and draw the cam J toward them. The finger K comes then in line with the reduced part of the cam and opens the valve for a shorter time: the entire quantity of burned gases is then not exhausted and during the following admission only a partial charge enters. In addition to this governor, which maintains a constant speed of the motor and prevents it from racing, there is provided a hand regulator, the operating lever of which is placed in a position convenient to the driver. This lever acts on the finger K and permits it to be shifted to any part of the variable cam. The normal speed of the engine is 800 revolutions per minute, but this may be increased or reduced at will by means of the mechanism above described. An ingenious arrangement is fitted in connection with the starting gear, the commutating device on the half-speed shaft which comes immedi-

ately below the starting spindle being so arranged that it is impossible for the spindle to engage with its spur wheel unless the ignition has been retarded to its slowest point. The carburettor is of the Longuemare float-feed type. The cylinder casting is so arranged that the induction pipe need not be removed when

top and bottom, by horizontal pipes, is so constructed that the steam from the jacket passes up the three central tubes, and is then free to return down the other tubes, the condensed water finding its way back by a connection on each side and leading down to the underside of the cylinder jacket. The water is

FIG. 140.—THE GILLET-FOREST TONNEAU.

[L'Avenir de l'Automobile.

it is necessary to remove the valves. The cooling of the cylinder is effected by very simple means, avoiding the use of a pump. The water in the jacket is kept at a constant level by a special float in a chamber in communication with the water tank. The apparatus known as a water float, which is placed alongside

replaced, as evaporation takes place, by the automatic ball valve device already referred to. In order to prevent any pressure being generated in the radiator, and also to prevent water from flowing away from it, syphon pipes are fitted to each end of the lower horizontal pipe, and these lead to the back of the car. Provision is also made for preventing air from interfering with the system, a small pipe being led from the top of the water float

FIG. 141.—THE GILLET-FOREST DELIVERY VAN.

the carburettor, shuts off the supply as soon as the required level is reached. The radiator is fixed immediately above the engine, so that a central connection to it fits direct on to a flange on the top of the cylinder water jacket. The radiator, which is composed of fluted tubes which are held vertical and are joined together

FIG. 142.—PLAN OF GILLET-FOREST CAR.

to a higher level than that of the water. Natural circulation may be said to take place in the cylinder jacket, but the temperature of the water approximately remains but little below 212 degrees when the motor is in regular work.

Coming now to the transmission, it may be mentioned that in addition to a reverse, three forward speeds, all controlled by a single lever, are provided, the three speeds being approximately six, twelve, and twenty miles an hour with the motor running at the normal speed. It has already been mentioned that the

power in the motor is transmitted to a half-speed shaft by bevel gearing. This shaft is mounted in line with the first motion shaft of the change-speed gear box, from which the power is conveyed to a rear live axle by a universally jointed shaft and bevel gearing. The change gear (Figs. 145 and 146) is on the sliding pinion principle. To economize space the second and third speeds have been placed on almost the same plane. To attain this end, the pinion of the third speed is fitted with teeth, both externally and internally; it runs free on the shaft B, and when it is to be engaged the pinion of the second speed is introduced into its interior, and the latter, being keyed to its shaft, drives the former.

FIGS. 143 AND 144.—SECTIONAL ELEVATION AND PLAN OF GILLET FOREST MOTOR.

The two lower forward speeds result from sliding one or other, of a pair of pinions into mesh in the ordinary manner. The reverse motion is obtained by means of the same lever; the sliding gears then transmit their motion to the shaft G through the intermediary of the pinions I I'. The change-speed gear is enclosed in an aluminium grease-containing case having a large removable cover. The gear box is attached to the frame by means of lugs cast on it, which correspond with lugs formed in the tubular frame. Two long bolts which pass through the lugs are alone required for fixing it. The cone of the friction clutch is normally held in engagement by a spring; the compression can be regulated by an adjusting screw placed on the rearward side of the gear box. The longitudinal shaft is not only fitted with universal joints at either end, but its connection to the second motion shaft is by a square sliding joint. The differential gear, together with the bevel wheels driving it, are enclosed in a cast-iron case, which surrounds the whole of the rear axle. A band brake is fitted on the longitudinal shaft; it is operated by a pedal, which also disengages the clutch. A second pedal serves to disengage the clutch only. Hand-operated band brakes are fitted on the hubs of the rear wheels, a pair being fitted to each wheel in the larger vehicles. A single hand-lever on the right-hand side of the driver controls the three forward speeds and the reverse. The steering is controlled by a hand wheel, bevel pinions being used in place of the usual worm gearing. The road wheels are of the artillery type, 34 in. diameter at the front, and 36 in. at the rear, and shod with pneumatic or solid rubber tyres as desired. The chief claim made for these cars is their economy in fuel, one of them having shown a consumption of 3.6 gallons per 100 miles, at an average speed of 20.25 miles per hour, in one of the recent trials in France. We may add that the 8-h.p. delivery van exhibited has been in

use for about six months; during that time it has covered a distance of nearly 7,000 miles, the cost of repairs being practically nil.

The Motor Carriage and Chassis Company's exhibit comprised two voituresses, one known as the "Esculapius," designed for the use of medical practitioners and other professional men who require a light and speedy car at a low price, affording accommodation for driver and one passenger, with provision for carrying the necessary impedimenta; the other, which has been named the "Knight of the Road," is intended for use by commercial travellers. The first-named is driven by an inclined double-cylinder Ader motor of 5-h.p. set in the fore part of the frame. Two forward speeds and a reverse motion are provided, the power being transmitted by a universally-jointed shaft and bevel-gearing to the rear axle. The water-cooling is effected by radiators placed on either side of the front of the carriage. The rear part of the bonnet is utilised as the water-tank. The car has a long wheel base, the body being provided with a hood extending well forward, and projecting over a plate-glass rain and wind guard. The "Knight of the Road" is similar as regards transmission, speeds and general arrangement, but is driven by a 5-h.p. single-cylinder Aster motor.

Petrol marine motors formed the main feature of the display made by Mr. E. A. McLachlan, who also exhibited a solid tyred voiturette. In this a vertical engine is fitted in front, the power being transmitted by belt to the countershaft, from whence it is conveyed to the back axle by a single chain.

FIGS. 145 AND 146.—SECTIONAL ELEVATION AND PLAN OF GILLET FOREST CHANGE-SPEED GEAR.

The London Autocar Company had a varied collection of motor parts and accessories for cars. In fact, an enumeration of the goods shown on their stand would embrace nearly everything coming under the general head of accessories. A special feature was, however, being made of the new Accles-De Veulle radiator, recently described in our columns. This works out at 1½ lbs. per h.p. and gives an extremely large cooling surface in a very compact form. The ignition wire clips we illustrated in a recent issue were apparently finding favour with motor cyclists present. Another exhibit on the stand consisted of parts for a motor-bicycle which could be started by hand, the motor being fitted with a clutch.

Tyres fitted with Williams' patent detachable and adjustable band fastening were shown by Messrs. J. E. Hopkinson and Company, Limited, whose stand also contained a selection of pneumatic tyres and solid rubber tyres for motor-cars, as well as inner tubes for motor tyres and india rubber matting, etc. To fit the fastenings the only tool necessary is a small key spanner to fit the square head for tightening up the screw. One end or band is screwed down to the felloe through a hole drilled for that purpose through the channel and the other.

Dr. Alfred Sternberg, of Berlin, was one of the new exhibitors at the English show. He had an interesting display of the Protos petrol motors which are made in four sizes, viz., 5, 6, 8, and 12-h.p., the latter having two cylinders. A sectional view of the 5-h.p. engine is given in Fig. 148, while Fig. 149 is a side view showing the exhaust valve and ignition control. The cylinder

FIG. 147.—PLAN OF "PROTOS" CAR.

diameter is 3.8 in., and the stroke $4\frac{1}{4}$ in.; the engine weighs with fly-wheel 83 lbs. On the stand was also shown a Protos car fitted with tonneau body, and a single cylinder motor developing 8-h.p. The water circulation is maintained by pump and radiators, while the carburettor is of the float-feed type. Outwardly this car differs but little from any other, having the regulation motor-bonnet, inclined steering, and artillery type wheels. From the illustration (Fig. 147), showing a view in plan of the chassis, it will be seen that the method of transmission adopted is on novel lines. Two speeds forward, and a reverse motion, are provided, the power of the engine being conveyed to the gear box (shown in section in Fig. 150), through a special clutch, which is built up of copper and steel plates. The gear box is compactly arranged, and consists of two shafts 17 and 24, the first of which carries a pair of bevel wheels 15 and 16,

gearing with a bevel pinion 14 on the end of the clutch shaft α , and the two spur wheels 12 and 13 gearing with corresponding wheels on the second shaft. This second shaft also carries a sprocket pinion, from which motion is transmitted to the balance geared back axle by a single central chain. The various speeds and reverse are thrown in and out by a jaw clutch 18, which can

FIGS. 148 AND 149.—THE "PROTOS" 5-H.P. MOTOR.

be moved either to the right or left, and made to engage with the jaws formed on the bosses of the bevel wheels 15 and 16. The rear axle is well supported, and a special arrangement is provided to take up any slackness of the chain due to wear. One pedal controls the clutch, a second one disengaging the clutch and applying two band brakes on the differential drum on the rear axle. A hand lever also actuates band brakes on each of the hubs of the rear road wheels.

FIG. 150.—SECTION OF "PROTOS" VARIABLE SPEED GEAR.

The performance of the new Miesse steam car at Cromer last Easter naturally tended to increase public interest in this type of vehicle, which was shown by the recently formed Miesse Steam Motor Syndicate, Limited. The vehicles are the design of a Belgian engineer, but arrangements are now being completed for their construction in this country. In outward

appearance they closely resemble the popular type of petrol car; they comprise a number of special features, which for the moment can only be briefly alluded to. The "Miesse" steam generator is of the "flash" type, and is constructed of one piece of solid cold drawn steel tube coiled up in a special manner, the length of the coil in the 10-h.p. generator

FIG. 151.—THE 10 H.P. MIESSE STEAM CAR.

being 300 ft. It has no joints throughout its entire length, and consequently cannot leak. It is guaranteed to withstand a pressure of over 10,000 lbs. per square inch (nearly 5 tons). It is heated by the Miesse burner before water is admitted, and as it at no time contains more than half a pint of water, no water-gauge is required. The burner having been started, no further attention to the generator is required, all that is necessary being to set the water-valve according to the speed desired. The admission of too much water to the generator only results in an excessive speed of the car, and if no water is injected, the engines stop; in either case no damage to the generator can, it is claimed, result. The generator is very compact, enabling it to be placed in the front of the car. Ordinary paraffin is used as fuel. The burners consist of grid-iron tubes, with small perforations for the exit of the vapour, and vaporisation of the fuel is effected by passing the liquid through a coiled tube round the fire-box, the starting heat being obtained by a blow lamp. The paraffin is passed along the coiled tube and is allowed to take up as much atmospheric air as can possibly be consumed with it. The vapour issues from some 1,200 holes with a pale blue flame, forming a mat covering the entire area of the under part of the generator, and free from any trace of smoke or smell. So perfect is the combustion, that after months of constant use the makers state that no sign of soot or unconsumed carbon can be found upon any part of the generator. The burner is entirely automatic in action; when the car is at rest for any length of time the burner can be turned down, the consumption of paraffin then being merely nominal. For town work or slow travelling, the burner can be used at half strength, with a corresponding economy in the fuel, under which conditions the supply will last for eight hours' continuous running. Sufficient steam to run the car can be raised from cold in six minutes. The engines are of the horizontal type, fitted with three single-acting cylinders, of trunk type, and are capable of running at a high speed. The crank pins are set at an angle of 120 deg.

to each other, consequently the engines are always ready to start either forwards or backwards. They can be linked up for slow running or steam economising, and reverse instantly. In the 6-h.p. engine the cylinders are 2in. in diameter by 3½in. stroke, and in the 10-h.p. 2 7/8in. diameter, by 6½in. stroke. All three cylinders are cast in one piece, and bolted to an enclosed crank chamber. The inlet valves, which are of the mushroom type, are arranged on the upper side, and the exhaust valves on the under side. The valves are all operated by cams, which, together with their cam shafts, slide longitudinally in order to reverse. Not only do the cam shafts slide, but the spur wheels which are fixed to them are drawn along sideways in mesh with the wide spur wheel which drives them. The steam inlet and exhaust valves are actuated by sliding cam rods, and the valves are of the poppet or petrol engine type, thus avoiding the loss of power resulting from the use of eccentrics and slide valves. The crank chamber is entirely enclosed, the cranks and connecting rods running in an oil bath, and automatically lubricating the pistons. The vehicle is fitted with a double set of steam condensers, which return the exhaust steam from the engine to the water tank, and enable long distances to be run without requiring additional water. In fact, it is stated that eighty miles can be run on twenty gallons of water. One end of the engine shaft operates an air pump which maintains the pressure in the fuel tank, and at the other end of the engine shaft, on a small countershaft, is mounted an eccentric which works the water pump. The fuel is under air pressure, and the supply of water to the generator is regulated by hand according to requirements. In the engine casting is also fitted the differential gear shaft, which is geared down by a spur-wheel drive to half the speed of the engine shaft, and receives its lubrication from the crank chamber. The differential shaft is in turn connected with the road wheels by two outside chains. The cars are made in two sizes, 6-h.p. and 10-h.p., and so far as outward appearance is

FIG. 152.—FRONT VIEW OF LUX 9 H.P. CAR. (See page 278.)

concerned, they might be mistaken for up-to-date petrol cars. Three cars were shown, a *tonneau* fitted with an engine rated at 6-h.p., but capable of developing up to 10-h.p.; a *coupe* to seat five persons, with 10-h.p. engine, working up to 17-h.p. if necessary; and a 10-h.p. *tonneau* (Fig. 151). Steering is controlled by an inclined hand wheel, while both foot and hand actuated

double-acting band brakes are fitted. The cars are very quiet in action and appear to be well adapted for touring purposes, being able to run long distances without it being necessary to stop for fresh supplies of fuel and water.

Although of a miscellaneous character, the exhibits of Messrs. Binney and Sons contained some features of interest to motorists, these including lubricators and lubricants, machine cut gears, steam-car fittings, and wood pulleys and belting, as well as general sundries. The Klinger water gauge was exhibited on their stand.

A type of car which is becoming well known in Germany, where it is made, but which is new to the English market, is the Lux, of which several were shown by Messrs. Philipp and Company. Of the 9-h.p. cars two were shown—a double phaeton (Fig. 153) and an eight-seated waggonette. The motor, which is set under a bonnet in the fore part of the frame, is of the two-cylinder horizontal type with a central crank-shaft (see Fig. 152). The cylinders are 110 mm. diameter by 110 mm. stroke, the normal speed being about 800 revolutions per minute. A governor is provided, this acting on the admission pipe; by means of an "accelerator," the governor can be put out of action as desired. The cam-shaft, which is hollow, is arranged above the crank-chamber, and is driven through an intermediate spur-wheel from the crank-shaft. The ignition is on the Simms-Bosch magneto system. The water circulation is maintained by pump and radiators. A special form of carburettor is employed, the air passing through a sloping and tangentially-arranged tube, which reaches almost to the surface of the carburettor, thereby giving the spirit a circular motion. Two silencers are fitted, one for each cylinder. They

FIG. 153.—THE LUX 9-H.P. (DOUBLE) PHAETON.

take the form of a perforated tube, on which are three or four pairs of conical plates, the edges of which closely approach, but do not quite touch each other, so that the exhaust gases, after passing into the innermost body, strike the first and the following walls, and pass out of the whole circumference of each shell, thus considerably reducing the noise of the exhaust. Three speeds forward and a reverse motion are provided. The power is transmitted through a clutch to a Panhard-type of gear-box, and thence by bevel-gearing to the counter-shaft and by two chains to the rear road-wheels. A new form of clutch, which appears to possess some useful features, is employed. It is of the band variety, a steel band encircling a drum round which it is gripped by the action of a cam when the pedal is released. A strong spiral spring controls the action of this band, and prevents the possibility of the grip being sudden, for, should the motor be racing when the clutch is put into action, the sharp contact immediately causes the spring to expand, after which it gradually recovers and tightens the grip upon the drum. The usual foot and hand-brakes are fitted, and also inclined wheel-steering. Fig. 154 gives a view in plan of the combination belt and gear-driven Lux car also shown. This is fitted with a 6-h.p. two-cylinder motor, comprising all the features referred to above. It will be noticed, however, that the engine is located at right angles to the position adopted in the 9-h.p. car. Three speeds and a reverse motion are

provided. The motor is connected by enclosed spur-gearing to a short shaft carried in links. On this is a pulley, a long wide belt conveying the power to the variable-speed gear-shaft in front of the rear axle. On this is a train of sliding spur-wheels, any one of which can be made to mesh with corresponding pinions on a short counter-shaft. On the centre of the latter is a spur-wheel continually in mesh with a toothed pinion fixed around the balance gear on the rear live axle. The belt does not work on fast and loose pulleys, but is slackened, when it is desired to disconnect the engine by means of the swinging links above referred to. The change speed-gear forms, with the differential gear, a completely enclosed whole with the back axle, all the frictional parts running in oil, containing dust-proof cases. The gear-case is fitted to the frame by means of springs. The car appears to run very quietly, and to be a well-built vehicle.

FIG. 154.—PLAN OF LUX 6-H.P. BELT AND GEAR-DRIVEN CAR.

A very large display of French built cars was made by the British Automobile Commercial Syndicate, Limited. Mr. Weigel first explained to us the features of the 40-h.p. Panhard with Berline body to seat six, built to the order of Col. Harry McCalmont, M.P. Two 16-h.p. Panhard cars with *tonneau* bodies, similar to that supplied to the King of Belgium, next engaged our attention, after which came a 24-h.p. Panhard for Lord Iveagh. This is fitted with a special form of body seating eight persons, there being two seats in double phaeton fashion, to the rear of which is a *tonneau*, the rear part being covered by an American buggy top. A couple of 12-h.p. Panhard cars and a chassis of the same makers' 7-h.p. vehicles were also staged. Fig. 155 gives a plan view showing the general arrangement of the motor and transmission gear. Its main features have already been described in the *Journal*. Of the De Dion cars with 8-h.p. single-cylinder

motor a couple were shown, both fitted with *tonneau* bodies. The main features of this vehicle were described and illustrated in our issue of March 22nd last, so that no further reference is necessary on the present occasion. Quite new to this country is the Clement car, with a 9½-h.p. double-cylinder engine, of which a *tonneau* in white and red was shown. The engine, which is located in the fore part of the frame, closely follows the lines of the Centaure. The sparking plugs fit into the top of the explosion chambers. A noticeable feature is

Sewell's pneumatic suspensory tyre was shown by Mr. J. McKim, C.E., who claims for this special form of tyre many advantages that are likely to appeal to motorists. At the outset we may mention that it can be fitted to new or old wheels, and being built in sections can be repaired or renewed piecemeal. As will be seen from Figs. 156 and 157, the tyre consists of a series of balls or spherical sections. When once the equilibrium or spherical point in the perpendicular is overcome the balance of the wheel is in the line of motion. As the balls are not placed

FIG. 155.—PLAN OF 7-H.P. PANHARD CAR.

the ease with which the valves can be removed. To do this it is only necessary to remove a single nut, the inlet pipe and dome swinging round out of position. The water circulation is maintained by a chain-driven pump and a radiator. The governor acts on the admission, and in connection with it is an accelerator controlled by a lever on the steering column. The transmission follows the lines adopted in the Renault, Darracq, and other chainless cars, the power being transmitted to a gear box, adapted to give three forward speeds and a reverse motion, and thence by universally-jointed shaft and bevel gearing to the rear live axle. The steering control and brakes follow the usual lines, the whole forming a very attractive and well-built vehicle. The carriage work

close together there is room for their expansion without being forced against each other, with the result that all the resilience must be in the line of motion. The belt of the ball is thickened to prevent it spreading at the side, the idea of the inventor being to throw the expansion to the back of the ball. Each ball is equally and permanently inflated and should puncture occur at any one point of the tyre the journey can be safely and comfortably continued, for the balls can be easily detached and renewed—a consideration of economy that cannot be overlooked. How this is done will be understood from a brief reference to the

FIGS. 156 & 157.—SECTIONAL AND GENERAL VIEW OF SEWELL'S TYRE.

of all these vehicles is by the firm of Messrs. J. Rothschild et Fils, Ltd., which is equivalent to saying that it is of the highest order. On a separate stand in the Minor Hall the company exhibited a "Foden" steam wagon belonging to the Earl of Shrewsbury and Talbot, and used on his Ingestre estate. A description of this vehicle was given in our issue of December 7th last, but we may mention that, generally speaking, the front part of the vehicle is of the traction engine type, the wagon portion being over the rear road wheels. The fuel used is coal, and the compound engine is placed on top of the horizontal boiler. It is intended to carry a load of four tons, and to haul a further three tons on a trailer.

FIG. 158.—SEWELL'S TYRES AS FITTED TO A MOTOR CAR.

method of construction. Beneath each rubber sphere the felloe of the wheel is cut away so that the air can cushion the pressure of the rubber blocks. Metal plates secure the rubber sections in places circumferentially, the plates being placed radially on edge between the rubber blocks which are also keyed into the flanged rim. Between the plates and blocks are small rubber wedges. The plates have slots cut in them into which other metal plates are fitted. When forced down into place these second plates meet one another at the sides of each rubber ball, and are not liable to become displaced when the wheel is in use.

(To be concluded.)

HERE AND THERE.

BREEZY but fine weather was characteristic of the holiday at Bournemouth, and there were great demands for motor-car rides, the public service vehicles being crowded all day.

THE Lexden and Winstree Rural District Council has declined to furnish its road surveyor with a motor-car, it being urged that before he was given such a luxury the roads should receive the benefit of any increased expenditure.

THE Piccadilly Motor Company, Limited, has been registered with a capital of £2,000, to acquire motor vehicles, motors, and to carry on the business of motor engineers and agents generally.

A NEW Club has just been formed in Paris to be known as the Mechanic Club. It will occupy itself exclusively with questions relating to the automobile industry, and its membership will be confined to motor-car builders, mechanics, and motor works' managers.

IN a recent issue we announced that Messrs. De Dion, Bouton and Co. were preparing to place a new bicycle motor of 1½-h.p.

on the market. We are now able to give two general views of the new motor, which we hope to fully describe in a subsequent issue.

WESTON MOTORS have just appointed a number of agents for the Weston steam cars, as follows:—City, Garages Limited, 34, Queen Street, E.C.; Liverpool and District, Messrs. Bennett and Carlisle, 68, Renshaw Street, Liverpool; Oxford, Oxford Automobile Agency, Oxford; and Reading, The Speedwell Motor and Engineering Company, Limited, Broad Street, Reading.

ONE of ours spent a few days at Blackpool last week end, but saw only four motor-cars in as many days in the popular seaside resort. A motor-bicyclist who went along the promenade on Saturday last created much attention, he being enveloped in blue smoke—the result of an overdose of lubricating oil.

AFTER a series of experiments in leathers of various kinds, and belts of different shapes, with severe working tests, Messrs. James Dawson and Son, Limited, have, under the name of "Lincona," lately introduced a new belt for motor bicycles. The leather of the belt is specially prepared and is of exceptional tensile strength and flexibility, while being almost entirely free from stretch. The shape is slightly V, the grip being obtained by a wedging process of the belt bearing upon the sides of the pulley, ample clearance being allowed below. The belt is of sufficient thickness to withstand the most severe strain without buckling or breaking, a sudden strain only increasing the grip upon the pulley and thereby avoiding the dangers consequent upon an engine racing.

THE Silesian Automobile Club is organising a tour from Breslau to Vienna. The start is fixed for June 25th.

MR. A. M'KIDD, cycle agent, Thurso, N.B., has secured a license for the stocking of motor-car spirit.

JUST prior to the Coronation festivities in Spain a service of electrical motor-cabs was started in Madrid.

THE Cologne Automobile Club is organising an automobile flower fete for the 1st prox.

MR. D. CITROEN has just issued a new edition of the handbook to the "Minerva" motor for bicycles. It should prove interesting and useful to all users of this engine.

IT is reported that Messrs. De Dion, Bouton and Co. are taking up the construction of heavy industrial vehicles propelled by petrol motors.

THE Bavarian Automobile Club is reported to be taking steps to organise an endurance test, to extend over several days, in the spring of 1903.

THE King's motor-car was at the works of Mr. Frank Morris, King's Lynn, last week, for overhauling and repairs, prior to its despatch to Windsor.

MR. F. H. CLINGOE, formerly one of their salesmen, is not now connected with the Farman Automobile Agency.

THE Rouen Veloce Club is organising a hill-climbing competition at Moulineaux, near Rouen, for Sunday next, the 25th inst. There will be categories for motor-cars, voiturettes, and motor-cycles.

THE marriage of Mr. Mark Mayhew and Miss Fisher is to be solemnised at Lytham on the 28th inst. The event will be of an extremely quiet nature, on account of the critical state of the health of the bridegroom's mother.

THE Motor Power Company, Limited, have acquired more spacious premises, and are now located at 14, New Burlington Street, where all business in connection with Napier and Gladiator cars will in the future be carried on.

THE first air-ship to tempt the English air will ascend from Highbury in about a fortnight. It is the work of the well-known firm of Spencer. Its balloon is 75 feet long, and the triangular girder (which contains a Simms petrol motor, the propeller, the car, and the rudder) is 45 feet in length. The car consists of a framework of bamboo, surrounded by network.

WITH reference to the recent consumption and hill-climbing trials at Dashwood Hill, Weston Motors write us to the effect that as one of the tyres on their car punctured just after leaving London, the major part of the outward journey, together with seven ascents up Dashwood Hill and the return journey, were accomplished with a deflated rear tyre. This naturally materially reduced the speed of the car.

THE Yorkshire Steam Motor Company, Ingham Street, Hunslet Road, Leeds, inform us that their business has been taken over by Messrs. Deighton's Patent Flue and Tube Company, Limited, Hunslet, Leeds, and in future will be carried on under the style of the Yorkshire Patent Steam Wagon Company. Large new works are being erected for this branch of their business; they will be equipped with all the latest labour-saving machinery, and will be under the same management as heretofore.

AFTER a successful week at the Automobile Exhibition the Vulcan Motor Company, of Southport, sent one of their cars on the journey home by road, a distance of 225 miles, to test its reliability and efficiency. The start was made on Tuesday, April 29th, from London. A non-stop run was made to Coventry, a distance of 104 miles, on a petrol consumption of one gallon for 42 miles, the average speed being well up to the legal limit. A start was again made the following morning, when the journey was completed in the afternoon without any stoppage.

MESSRS. WILLIAM SMITH AND SON, FORRES, N.B., inform us that they are keeping a stock of motor spirit.

THE British Automobile Commercial Syndicate have just acquired the sole agency for Great Britain and Ireland of the new "Clement" car.

IN a three miles motor-cycle race at Edmonton, a few days ago, T. H. Tessier was first; S. G. Graham, second; and G. Matthews, Tottenham, third. Time, 6min. 45 2-5sec.

A NEW stand for motor-bicycles has just been put on the market by Messrs. Hutton and Company, of Warminster. It has a large base, and, as it holds the rear wheel clear of the ground, it will be found useful in testing the motor before setting out for a ride.

THE British Automobile Commercial Syndicate inform us that they have engaged one of the principal foremen of Messrs. Panhard and Levassor to take charge of the new repair department they are just establishing. The repair shop will be ready within the next week or so.

JUST now there seems to be a competition between rich men in America to see who can give the most money for a motor-car. At present the top price is said to be 17,000 dols. (£3,400), the amount alleged to have been paid for a high-powered French vehicle by a New York broker.

THE Chicago Automobile Club has offered a reward of £20 for the policeman who makes the most daring rescue of persons in a runaway vehicle during the ensuing year, in this respect following the example of the A.C.A., which recently offered a reward of the same kind in New York.

A BAZAAR in aid of the Great Ormond Street (London) Hospital for Sick Children will be held in the Hospital Gardens during the first week of July. The Bazaar Committee announce that, owing to the generosity of the Daimler Motor Company, Limited, a 12 horse-power carriage of the newest type will be raffled for, two hundred tickets of £5 each being issued.

AN extraordinary general meeting of the Motor Manufacturing Company, Limited, was held on Saturday last at 47, Holborn Viaduct, London, E.C., to-day (Saturday), when the resolution, "That the company be wound up voluntarily," passed at the extraordinary general meeting of the company held on the 1st inst., was submitted for confirmation as a special resolution.

AMONG the latest legislative novelties of the United States is a bill introduced in the New Jersey Legislature, the object of which is to compel motorists to slow down to six miles an hour when passing a farmer's wagon, and giving any citizen power to make arrests in case of the violation of the law—truly an interesting development of the prejudice against motorists.

THE Motor Fittings and Engineering Company are introducing a new motor-bicycle, which they have named the "Sirius." It is fitted with a 2-h.p. air-cooled motor placed vertically in the frame, the crank-case resting in the angle between the bottom of the seat tube and the lower cross tube of the frame. The motor has a cylinder 66 mm. diameter by 72 mm. stroke. The mixture is furnished by a Roubeau spray carburettor, and the power is transmitted to a pulley on the rear wheel by a belt. The machine complete weighs about 70 lbs.

AN important addition to the number of steam vehicles which depart radically from the conventional type is the new Victor steam touring car, made by the Overman Automobile Company. The vehicle is designed on the lines of petrol cars, the body comprising a detachable *tonneau* body. The car weighs, empty, about 20 cwt. A steel angle frame is used, and all bearings, engine journals, etc., are plain. A horizontal high-pressure two-cylinder engine, with a bore of 3½ inches and a stroke of 6 inches, is employed. The maximum engine speed is 500 revolutions per minute, and the indicated horse-power 14. The boiler is of the vertical fire-tube type, having 756 ½-inch tubes; the diameter is 23 inches. The transmission is by sprockets on countershafts in combination with a chain drive.

CORRESPONDENCE.

THE FRENCH ALCOHOL TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed in the account of the alcohol trials two curious things: In one case a 40-h.p. Panhard only beat a 20-h.p. Darracq by 45 minutes; in the other case, the 40-h.p. only beat a 16-h.p. by the same maker by 18 minutes. Thus, in the first instance, twice the horse-power only gained 45 minutes, and in the other instance more than twice the horse-power only gave a gain of 18 minutes. Surely these results involve a most extraordinary mechanical absurdity when compared with the ordinary applications of motive power. Where did all the lost horse-power go to?—Yours truly,

C. E.

LICENCE FOR MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be pleased to have the opinion of any of your readers as to whether a licence is required for a motor-bicycle if only used for trial rides by probable buyers. I have purchased one for sale, and the Excise officer informs me that I cannot buy it for sale purposes unless I take out a 15s. licence, which I do not consider necessary.—Yours truly,

B. S.

WARNINGS TO MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think Mr. Herbert A. Jones might have taken the trouble to hear both sides of the question before sending you the letter which appeared in your last issue. He states that the constable had only taken proceedings when warnings were of no avail. Now in making this statement both the inspector and constable differ from my view, and I think this variant is a fair sample of the facts gathered during the interview.—Yours truly,

J. SCRIVEN.

AN AMERICAN ADVERTISING NOVELTY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Jones' reply (published in your last issue) to Mr. Scriven's letter of May 3 is rather stronger than the merits of the case seem to warrant. In the first place, the road in question within the two miles has no curvature of an angle of above 12½ degs. Consequently the outlook from a car is quite sufficient to command a distance in any place thereon of at least 200 yards. Secondly, I claim that the dip into Stanningly is steep, and no one but a narrow-minded person would ride down it at any great speed, and that Mr. Scriven, with whom I was riding on the evening in question, always thinks of other users of the road.

As to the verbal courtesy of the W.R. Police of this district I have no complaint to make. I could not, however, conscientiously support their statement in the same unqualified manner. I do not assert that they are wilfully inaccurate, but their statements are often hardly reliable. At the same time, when Mr. Scriven's case was tried, a youth of sixteen years was fined a nominal sum for riding without a light.

J. E. KERSHAW.

NEGLECTING TO STOP.

At the Dorset County Petty Sessions, last week, Launcelet Perry-Keene of London, was summoned for a breach of the Locomotives and Highways Order at Bemerton, the allegation being that he neglected to stop his motor-car when Miss Annie Kendell, of Shrewton, held up her hand as a signal. Mr. Staplee Firth appeared for the defendant. The facts of the case, as detailed by Mr. W. Kendell, retired farmer, of Shrewton, and Miss Annie Kendell, his daughter, were briefly as follows:—On February 11th Mr. Kendell and his daughter were driving into Salisbury from Shrewton.

After they had passed Tinkerpit Hill, Bemerton, a motor-car came along, and knowing that the horse they were driving was very nervous and would not pass motor-cars when in motion, Miss Kendell held up her hand as a signal for the driver of the on-coming car to stop. Although this signal was given, the motorist did not stop, with the result that the horse turned across the road, and ran the cart up on to the raised pathway, both Mr. Kendell and his daughter being thrown out, the former being injured to such an extent that it was considered advisable to take him to Salisbury Infirmary. For the defence evidence was given by the defendant himself, also by George B. Williams and Walter Mark Chalk, of Shrewton, and Charles Blake, of Wilton. Defendant said he had motored over 40,000 miles during the last five years, and had never had a single complaint laid against him. He did not see any signal given by Miss Kendell. After the accident witness and a man Blake, who was working on the road, paced the distance from the motor-car to the place where the accident occurred, and found it to be twenty-one paces. Without calling upon Mr. Firth to address them, the magistrates decided to dismiss the case, but the Chairman said the case was fairly brought into court, and each party would have to pay their own expenses.

DE DION BATTERIES.

On Thursday last week, in the Chancery Division, Mr. Justice Joyce had before him the case of *De Dion, Bouton and Co. v. Brown Bros., Ltd.*, which was a motion on behalf of the plaintiffs for an injunction to restrain the defendants from passing off as *De Dion* batteries goods which were not the plaintiffs'. Mr. Hughes, K.C., was for the plaintiffs, and Mr. Younger, K.C., and Mr. George Hart for the defendants. Mr. Hart said it was a small matter, and the thing complained of had occurred through an oversight of an employee, and was entirely contrary to the instructions given him. It would not occur again. His lordship directed the motion to stand over till the first motion day in next sittings.

MOTOR-CYCLE RACING.

The eleventh annual athletic meeting promoted by the Corporation of the borough of Portsmouth, in aid of the local charities, was held on the North End Recreation Ground, Portsmouth, on Monday. The programme included a three-mile motor bicycle race. F. Shaw, of Eastney, won easily, covering the distance in 5 min. 53½ secs., a record for the track.

There was a good attendance of spectators at the Dover Athletic Ground on Monday, when the annual cycle races, under the auspices of the Dover Cycling Club, were held. A novelty was introduced this year by the addition of two motor-cycle races, Steele proving the winner in both events.

In a five-mile motor-cycle race, at the Whit-Monday Sports at Coventry, S. H. Sharp beat S. Wright by 40 yards in 16 min. 57 secs.

STEALING A MOTOR-CAR.

At the Marlborough Street Police Court, W., last week, Adolph Otto, 31, engineer, was charged with having stolen in February a motor-car worth £130, belonging to Messrs. Mann and Overton. Mr. Staplee Firth prosecuted. Having secured an introduction to the firm in question, the prisoner hired the motor-car at £3 per week, but eventually, being in difficulties, sold it for half its value at Chelmsford. The facts were not ascertained until after the prisoner had been convicted of stealing another motor-car and a bicycle, for which he was now undergoing three months' hard labour. Mr. Kennedy sentenced the prisoner to six months' imprisonment, the sentence to begin from the date when the prisoner was ordered to undergo the three months' hard labour.

A DISORDERLY MOTORIST.

At Bow Street, on Tuesday, Stanley Vernon Leigh was charged before Sir A. de Rutzen with being drunk while in charge of a motor-car, and Norah Leigh, his wife, was charged with being drunk and disorderly. P.C. 175 E deposed that at ten o'clock on Monday night he saw the male prisoner driving a motor-car along the Strand. When passing the Tivoli Music Hall he shot in front of an omnibus, and witness called upon him to stop. He pulled up, but refused to get down for some minutes, and the officer then discovered he was drunk, and proceeded to take him into custody. The woman, who was riding with him, was also drunk, and as she began to shout and insisted upon being locked up with her husband, she was accommodated. Sir Albert pointed out the danger of persons getting drunk while in charge of motor-cars, and fined the male prisoner 40s. The woman was bound over to keep the peace.

CAMERAS IN HYDE PARK.

At the Marlborough Street Police-court on Tuesday Mr. Argent Archer, of 195A, High Street, Kensington, was summoned for having unlawfully taken photographs of persons in Hyde Park on April 29th. Constable Mungo Park stated that the defendant was taking a group in a motor-car, his permit being limited to taking photographs of scenery. The defendant produced the photograph in question, which he explained was of the motor-car which was then about to start for a tour round the world, and was to be used by the *Motor-Car Journal*. He had taken photographs for

illustrated papers for years, and there had never been any objection taken before. Mr. Denman explained that the regulations limited the defendant's permit to taking scenery and not groups, as it was desirable that cameras should not be dotted all over the park as they were at Margate sands, taking photographs of people against their will. In this case it would be sufficient if the defendant paid 2s., the cost of the summons.

FURIOUS DRIVING CASES.

At the Lincoln City Police Court, last week, Albert Geo. Dyke, trading as R. M. Wright and Co., was summoned for driving a motor-cycle, in Newland and Gas Street, Lincoln, furiously and to the danger of foot passengers, on May 4th. Police-Constable Croft stated that about 11.20 on Sunday morning he was on duty at the Newland end of Newland Street West, when he saw the defendant riding a motor bicycle at the rate of 16 or 17 miles an hour. The witness was cross-examined as to the way he judged the pace. The defendant gave evidence, and the Chairman said the magistrates were not satisfied under the words of the Act that the defendant was riding to the danger of life and limb of any passenger or person. They thought, however, that there was a great deal too much rapid riding in the town, and that more discretion should be exercised both by riders of motor-cycles and drivers of motor-cars. The case was dismissed.

At Leicester County Police Court, on Saturday, George Belville, gentleman, Stoughton, was charged with furiously driving a motor-car at Oadby on the 11th inst. Mr. Rowlatt appeared for the police, and Sir Thomas Wright for defendant. The evidence for the prosecution was that the car was being driven at a pace variously estimated at between 18 and 25 miles an hour, though the defendant slowed up to eight or ten miles an hour when turning a corner into Stoughton Lane. Sir Thomas Wright argued that it was not practicable for a constable to state definitely that a vehicle was going at a certain number of miles per hour, and said defendant denied exceeding the regulation limit. A fine of £5 and 30s. 6d. costs was inflicted.

At Oxford, last week, W. L. Creyke was summoned for furiously driving a motor-car on the Abingdon road, on May 9th. Defendant pleaded not guilty, and was defended by Mr. A. Walsh, who said the car the defendant was driving was not the record-breaker. He was quite willing to admit that the defendant was going at a greater speed than the Local Government Board's orders allowed, but defendant was summoned under the Highway Act, and he asked the Bench to say that there was no furious driving under the Highway Act. The Bench imposed a fine of 40s. and 11s. 6d. costs.

In the Belfast Summons Court, last week, Leslie Porter was summoned for furiously driving a motor-car on April 24th, to the danger of the public, in York Street. Mr. Donnelly, who represented defendant, said he was instructed to enter a plea of guilty, as his client admitted driving at the rate of about fifteen miles an hour. A fine of 20s. and costs was imposed.

Before the Surrey County Bench, last week, G. C. Ashton Johnson was summoned for driving a motor-car on the main road near Ripley at a greater speed than twelve miles an hour, on May 4th. Defendant pleaded not guilty, and said he purchased the car because it was of a particularly slow make. Fined £5.

At the Dingwall Burgh Police Court, last week, Talbot Clifton and William Wilmshurst were charged with having driven a motor-car through the burgh of Dingwall on the 10th and 15th April, at a speed above the regulation speed allowed by the Locomotives on Highways Regulation Act, 1901. Both the accused failed to appear. Mr. Duncan, solicitor, appeared for Mr. Clifton, and stated that the accused had been commanded by the King to appear at the Levee at Buckingham Palace. The King's order must always be attended to, and so he could not possibly appear that day. The Procurator-Fiscal agreed that the Court should be continued for a fortnight.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, MAY 31, 1902

[No. 169.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ALTHOUGH the majority of the cars returned from Bexhill to town on Tuesday, last week, several stayed till Wednesday. Of these, the passengers on five cars arranged to lunch together at Uckfield. After lunch, about three o'clock, a start was made for East Grinstead, and as the distance was but short the cars were fairly close together. Nearing the latter place, Mr. Gregson, who was on his winning 12-h.p. Gladiator, had just passed a horse drawing a heavy load of timber, when the animal swung round, and as the timber projected, as timber usually does, the tail end only missed the motorist's face by inches. A truly marvellous escape. We were also in a bad plight, as the cart had got square across the road, but having more time we were enabled to drive on to the grass and so pass by.

The Return Journey.

WEDNESDAY was a lovely day, and so the return journey through the Sussex and Surrey lanes was most enjoyable, and, as the fear of the law was on us all, we had ample time to feast our eyes on the beautiful scenery, occasionally stopping, after hearing a whistle from behind a hedge, to pick flowers and botanise generally. At East Hoathly, where there is a straight road for miles and "devil the sight of a house," a gentleman came out and warned us there was a measured furlong just ahead with "yokels" in charge of the timing arrangements. At East Grinstead dreadful tales of "captures" the previous day were told, and also the information volunteered that the police in large numbers were still on the prowl. The owners of the four cars, all that were left, decided to make a detour, and Reigate was fixed on for tea, but in crossing a Common, with many roads and numerous signboards directing to places we knew not of, we got separated, reaching Reigate after travelling through some beautiful lanes. While waiting we amused ourselves photographing a Reigate policeman under the shadow of the Town Hall. Our friends not arriving, we rode up the hill at a fine "bat," and reached Bloomsbury just before seven.

Bexhill.

It is estimated that about six hundred motor-cars were housed at Bexhill-on-Sea on the night preceding the recent eventful trials at that town. The financial value of such a gathering to Bexhill can hardly be gauged, but there is no doubt it will have a great effect upon the season at the popular resort. Not only was the town mentioned by practically every newspaper throughout the United Kingdom, but it has suddenly leapt into prominence so far as the Continental press is concerned. In addition, the hotel-keepers and similar classes in Bexhill have reaped a substantial harvest. The gathering was certainly a remarkable demonstration of the wealth that is connected with automobilism as a pastime, and should do much to convince the public that the popularisation of the industry will be to the advantage of more than one British trade. So far as the number

of cars in the town were concerned, it was satisfactory to notice what a large proportion were of British manufacture, and it is notable that the first cars in the competition for the House of Commons Cup for cars having the best appearance were of English make.

Charter Day at Bexhill.

BEXHILL-ON-SEA has been raised to the dignity of a municipal borough, and Charter Day will be long remembered in the district. This took place amid scenes of great rejoicing, and Lord De la Warr entertained a large company at the Kur-saal in honour of the event. In the morning a small deputation came to London for the Charter, and it was met at Bexhill by Lord De la Warr and some of the leading townspeople. Mounting an Argyll voiturette, driven by Mr. Bradney Williams, his lordship thus conveyed the precious document to the Town Hall, where its contents were read by the town clerk. In the procession round the town which followed the proceedings motor-cars figured prominently, one conveying the new Mayor and Mr. Daniel Mayer, J.P., and another having as passengers Dr. Oswald Osborne, the medical officer of health, and Mr. W. T. Le Feuvre, A.M.I.E., the resident electrical engineer.

Assisting the Police.

VARIOUS are the uses of the motor-car. By its aid the King of the Belgians was recently able to escape the ill-mannered attentions of some of his subjects, and sportsmen have found it useful in conveying injured persons to the nearest haven of refuge. Now the police of Birmingham have recognised its value in another direction. A man who was being taken to the police-station for his drunken and disorderly conduct was so boisterous that the efforts of the police were unavailing. Fortunately, a motor-car came on the scene. This was stopped, and the officer and two others succeeded in lifting the prisoner into the bottom of the automobile, which was at once driven to the police-station. On the way, however, prisoner behaved like a madman, and it was with considerable difficulty that he was removed from the motor-car to the cells by Sergeant Smye and the other men. He was considerably bruised, and the policemen's trousers were torn in the struggle. Seeing the way in which the police of some localities harass motorists, this must be regarded as a case of returning good for evil.

Farmers and Motor-Waggons.

ONE of the great difficulties which fruit-growers and market gardeners have had to contend with has been a want of early delivery to market centres in London. Those nearest to London have to some extent overcome this difficulty by sending their goods by road, which naturally entails a very heavy expense in horseflesh. This difficulty would appear to have been successfully overcome by the enterprise of a firm of leading Kentish fruit-growers, Messrs. Thomas Wood and Sons, of Swanley, who a few days ago sent up for the first time to Spitalfields Market

in a steam waggon five tons of vegetables. It started from Swanley at night and returned early in the morning, a distance of nearly forty miles there and back, without a mishap. The advantages of this new departure to those who do not rely on railway companies for the mode of transit cannot be over-estimated, and it is to be hoped that many others will follow their example.

Mrs Kennard.

AMONG lady motorists few have achieved the distinction that has been won by Mrs. Mary Kennard, the novelist. She has toured through Great Britain on a motor-car, and went through the 1,000-mile Trial with a courage that did credit to her energy and determination. Shortly after that event she wrote in our columns an interesting article setting forth the

excellent way in which the smaller vehicles had gone through the Trial. More recently she wrote—also in the *Journal*—an article on motor-bicycles, which testified to the practical way in which she has been studying the question of automobilism, and now we have pleasure in giving a photograph of this lady motor-bicyclist mounted on her Ivel motor-bicycle. Few ladies have so thoroughly grappled with the problems associated with motoring.

Mr. Mark Mayhew, L.C.C.

MR. MARK MAYHEW—to whom we tender our congratulations on his marriage—has been interviewed by one of the municipal journals. He described the London roads as being the worst in the kingdom, while English roads are inferior to those north of the Tweed. But the best of British roads are poor when compared with those of France. There the central government, and not the department or county authorities, is responsible for the making or mending of the roads, and as a result the main roads are simply perfect—as hard and smooth as could be wished. During the last four years Mr. Mayhew has owned and driven more than twenty-five motor-cars, and estimates his total mileage at 55,000.

The 1902 Exhibition.

THIS week we conclude our review of the Motor-Car Exhibition, and the present, with the five preceding issues will thus have an added value as furnishing the most comprehensive account of the great event of the year that has appeared anywhere. Avoiding the invidious practice of selecting certain firms only for reference, we have dealt with every stand at the Exhibition, and in an impartial way have described the leading features of every display. Although this has given our pages somewhat of a technical appearance of late, we venture to assert that readers have appreciated the permanent record which they have thus obtained of the Motor-Car Exhibition of 1902.

The 1903 Show.

Now that we have done with the Exhibition for the present year, we may be forgiven another reference to that for 1903. The Agricultural Hall will again be the venue, and the success of the recent display will be repeated. Already most of the best positions on the ground floor have been booked—which is a stage further than inquiry only—and we would remind those who have not yet made up their minds that early application is absolutely essential for the remaining spaces. From the bookings that have already been made it is evident that all the ground space will again be occupied, while the show of accessory firms in the gallery will be even more complete than upon the recent occasion. This is very satisfactory, and the efforts made to cause the trade to break their allegiance to the promoter of the series of motor-car exhibitions at the Agricultural Hall must be regarded as proof of the fact that the last Exhibition was of undoubted financial value to the industry.

Annoying Motorists.

THE cabman who sought to annoy Major Bailey when the latter was leaving the Motor-Car Exhibition on a motor-car is not likely to do so again, and the case—reported on another page—should prove a salutary warning to drivers of horse-drawn vehicles not to get unnecessarily in the way of motor-cars. Motorists have so long had to endure the insults of cabbies and busmen that little sympathy will be felt with the defendant in this instance.

A MISHAP AT BEXHILL. M. SERPOLLET'S CAR CATCHES FIRE.

New Sixpenny Weeklies.

AMONG the plethora of sixpenny motor journals promised to brighten the Coronation festivities are the *Car Illustrated*, which is being edited by our good friend the Hon. J. Scott Montagu, M.P., the *Automobile*, and the *Court Motorist*, both of which will be edited by members of the Peerage. It is understood that the staffs of all these journals have been completed. Evidently Society motorists will have no lack of reading matter, and for about half-a-crown a week will be able to know as much as the readers of *The Motor-Car Journal*, which will continue to be published at one penny.

Coronation Meets.

THE Liverpool, Manchester, and Yorkshire Clubs so well enjoyed their recent joint outing to Buxton that a suggestion has been made for another gathering during the period of the Coronation festivities. This will probably take place at Harrogate, and it should result in a great assembly of motor-cars from all the leading centres of Lancashire and Yorkshire. We hear of other similar meetings in course of arrangement for the closing days of June, and shall be pleased to receive full particulars from those who are organising the same.

Some Holiday Parties.

DURING the Whitsun Recess, Sir Francis and Lady Jeune spent several days at their country seat, Arlington Manor, near Newbury, where they entertained a number of guests, including Mr. Brodrick, Secretary of State for War. One of the most interesting features of the holiday party were the runs through some of the pleasant scenery of Berkshire, which the guests enjoyed in Sir Francis Jeune's motor-car, and probably his experience during Whitsuntide should help the Secretary for War in coming to a favourable opinion with regard to the value of automobiles for carrying despatches and other ways in which the movements of the War Office might be accelerated with advantage. Away in Worcestershire a distinguished holiday party has been taking advantage of the automobile for pleasure trips, and Lord Elcho, while visiting Broadway in a motor-car, took advantage of the annual dinner of the local Mutual Aid Friendly Society to refer to motor-cars as something which had come to stay—he might have added, to go—and declared that they would be very useful to agriculture. He rightly condemned the thoughtlessness of drivers of automobiles who paid no heed to the comfort and safety of other people on the road, a condemnation in which he will be supported by all who have the welfare of the movement at heart.

Horse v. Motor.

THE other afternoon a well-known Tunbridge Wells medical gentleman, Mr. Abbot, M.R.C.S., of Church Road, had an exciting roadside experience between Tunbridge Wells and Eridge. Mr. Abbot was in the district named, and had to pass with his new motor-car one of the coal vans of a local firm. As soon as the automobile had passed, the horse bolted beyond the control of the driver, and followed the vehicle for a long distance at great speed. Mr. Abbott, fearing a collision between the runaway and his car, put on the latter at its fullest speed, but still the horse and van, now driverless, gained upon the car, and threatened disastrous results. The exciting chase had lasted nearly two miles, when Mr. Abbott managed suddenly to turn his now "exhausted" motor-car into a wayside recess on the Eridge road just as the runaway horse with the coal van dashed ahead at full speed. The next hill, however, was too much for the runaway, for half-way up sheer exhaustion compelled it to check its mad career. Mr. Abbott, safe in the rear, was able to resume his journey to Tunbridge Wells, thankful, no doubt, at having escaped what might have been a very serious accident. Some time ago a similar incident occurred at Reigate.

The Reading Automobile Club.

THE Whitsuntide tour to the West of England organised by the Reading Automobile Club proved a success, in spite of the terrible weather which was encountered, and which made the running very heavy. Nothing daunted, however, the enthusiastic motorists ploughed their way through seas of mud, deluges of rain, and malignant onslaughts of hail, and their perseverance was rewarded when they found themselves little more than half an hour late at Wells, after a struggle against fearful odds for more than ninety miles. Refreshed by an excellent lunch at the Star Hotel, they started in a terrific

hailstorm for the next stage — to Taunton. One of the members was bothered soon after the start with a short circuit (and no wonder) on his Ariel, but after a little delay this was remedied and the journey resumed. A nasty skid with a motor trike kept another member at Taunton for a while, where also the president and ex-president wrangled with a suiky carburettor for a time, but finally the triumph of mind over matter prevailed, and the journey to Dulverton was successfully completed. The Red Lion Hotel here extended its hospitality to the somewhat bedraggled wayfarers, who gladly availed themselves of its shelter until the following day. The morning proving fine, Frenas and Kodaks were in great evidence, and after strolling about for a few hours in this lovely village the members continued the journey to Porlock, the automobiles making the long ascent to Wheddon Cross in splendid style. The remainder of the day was taken up in "snapshotting" some of the many charming features of Dunster and Porlock, and in paying the several little attentions in the shape of grease and oil, due to the two, three, and four-wheeled friends. Whit-Monday saw the friends again in full flight, well up to the legal limit, across the Quantocks and Mendips, the return journey being accomplished in two hours under the scheduled time. In view of the differences of opinion recently expressed concerning large single-cylinder cars, it may be of interest to note that Mr. Paxton Petty drove one of the latest 8-h.p. Renaults, and that the car with four up and luggage behaved throughout admirably, and that the theoretical discomfort of the heavy thrust proved to be a myth. Automobilists have also expressed a doubt as to the advisability of putting large engines on to tricycles for touring purposes, and it may not be amiss here to note that Dr. Claude Truman rode a Rochet tricycle, fitted with a 4-h.p. water-cooled Aster motor and Bozier two-speed gear, and was entirely satisfied with its splendid behaviour and ease of control.

WEIGHING THE CARS AT ST. LEONARDS.

AN OBSTACLE ON THE TRACK.

Photo by

THE 50-h.p. NAPIER.

(Mr. T. B. Percy.)

The Late Mr. Duncombe.

WE regret to hear of the death of Captain the Hon. Cecil Duncombe, who succumbed to pneumonia, supervening upon an attack of influenza, at a friend's house at Toddington, in Gloucestershire. The deceased gentleman was in his seventieth year, and was the only surviving brother of the Earl of

Feversham. He was formerly Captain of the 1st Life Guards, and at the time of his death was a director of the North-Eastern Railway Company. For some years he lived the life of a country gentleman at his Yorkshire estate, also evincing a keen interest in automobilism. Mr. Duncombe served upon the Committee of the Automobile Club, and was a member of the Foreign Relations Committee of that organisation.

Hill Climbing.

THE Gas House Hill at Norwich is attaining the distinction that was accorded the Porlock Hill in the West Country a few seasons ago. A 50-h.p. Napier car was the first to make the ascent; then a Locomobile went up, and now a third car has successfully negotiated the steep incline, up which, it is said, no horse and cart has ever gone. On Saturday Mr. Mawdsley Brooke, of Lowestoft, drove one of his new cars up Gas House Hill with his bottom speed geared to nine miles an hour. The car had four passengers aboard, and seems to have done the performance in good style.

The Halifax Automobile Club.

THE Whitsuntide run of the Halifax Automobile Club was to Askern. The start was made from St. George's Square, Halifax, and after a most successful run the cars arrived at their destination as follows:—Mr. J. T. Simpson, 5-h.p. Wolseley; Mr. James Rhodes, 8-h.p. De Dion, with Mr. Raymond Wood, hon. sec. of the Club, as a passenger; Mr. Donald Sagar, 8-h.p. De Dion; Mr. and Mrs. G. E. Garside, 5-h.p. Wolseley; Mr. and Mrs. J. Lord, 6-h.p. Jackson; Mr. Gaines, 6½-h.p. Darracq; Mr. and Mrs. J. Redman, 4½-h.p. De Dion; Mr. Dixon, 6-h.p. Jackson car; Dr. Hackett, Werner motor-bicycle; Mr. Cartmell, Phoenix motor-bicycle; and Mr. Mortimer, De Dion tricycle. The outward journey was *via* Cooper Bridge, Dewsbury, Wakefield, and Campsall to Askern, where the members partook of lunch at the Swan Hotel. The return journey was made *via* Wakefield, East Ardsley, Drighlington, and Lightcliffe to Halifax. All agreed that the run was a most successful event, the weather being on its good behaviour.

Automobiles in Surrey.

SOME of the tradespeople of Richmond have been trying to induce the local Town Council to associate itself with an attitude of hostility to motor-cars, and their petition has been referred to the General Purposes Committee for consideration. In the discussion which preceded this decision, the Mayor said there seemed to be less danger from motor-cars than from horses, for they could be pulled up very quickly, while they could not pull a horse up in equally quick time. In fact, he was of opinion that motor-cars should be allowed to go faster than a horse, and certainly faster than they were permitted to do at present. Some of the hotel-keepers of Surrey have already publicly condemned the action of the police in frightening large numbers of motorists from the roads of Surrey, and we hope the words of the Mayor of Richmond will have a wide publicity throughout the southern counties.

Motor-Cars in Burmah.

THE French Consul at Rangoon has forwarded to his Government some interesting information on the subject of the importation of motor-cars into Burmah. He states that the great obstacle in the way of importing the cars into that country is to be found in the impossibility of securing petrol. The Consul specially recommends the import of heavy oil voitures, and reminds manufacturers that the duty is 5 per cent. *ad valorem*, and that no special licence is required to drive a motor-car in Burmah.

Motor Cycle Races.

THE ARGYLE ATHLETIC CLUB, Plymouth, are organising a Coronation two days' Motor Cycling Meeting, for Friday and Saturday, June 27th and 28th, on the Home Park Cycling Track, Plymouth. The following is the programme of events.

First day: A five miles scratch race for motor-bicycles over 112 lbs. in weight and under 200 lbs.; a five miles handicap for motor-bicycles under 112 lbs. in weight; and a five miles handicap for all classes of motor bicycles. Second day: A five miles scratch race for motor-bicycles under 112 lbs. weight; a five miles handicap for motor-bicycles over 112 lbs. weight and under 200 lbs.; and a five miles scratch race, open to all classes of motor-bicycles. A five guinea cup will be presented to the fastest machine breaking the present one mile motor cycle record, 1min. 36 2-5sec. Three trials will be given each machine, no pedalling will be allowed after the first half-lap.

TO-DAY (Saturday) the members of the Manchester Automobile Club will hold a run to Nantwich.

THE Bridgwater Motor Company, Bridgwater, have laid down a dynamo and plant for charging accumulators.

POOR Punch! His joke on the name of the Mors car in this week's issue reveals the fact that he jokes with difficulty—more's the pity.

MR. J. W. F. DANIELS, 6, Norwich Road, Ipswich, writes us that a large brass grease cup from a motor-car has been found near his house.

MAIDENHEAD and the surrounding villages are taking much interest in the doings of the Sultan of Johore, who recently arrived with his motor-car.

AT Marlborough Street Police-court, on Wednesday, Oswald Lord was committed for trial for causing bodily harm by negligence in driving a motor-car. Bail was allowed.

THE ascents which M. Santos Dumont proposed to make from the Crystal Palace have been indefinitely postponed, owing to the silk casing of his airship having been badly torn.

IN the House of Commons, on Tuesday, Mr. Chaplin urged that fresh regulations were necessary with regard to motor-cars, and Mr. Long in reply admitted that such was the case. This statement has been emphasised in a letter which the Automobile Club is issuing to the Press.

AT Hailsham, on Wednesday, Messrs. J. A. Holder, W. Bowker, E. O. Trafford, and M. Napier were each fined £1 and costs for furiously driving motor-cars after the trials at Bexhill.

MR. T. A. BROOKS, of the Angel Hotel, Guildford, has written a letter of protest against the way in which the Surrey police harass motorists. Other hotel-keepers in the county should follow his example.

LAST week's *Sketch* had a portrait of Mrs. Brown-Potter "in her own motor-car," a wording probably used to indicate her ownership as apart from the usual legend, "Miss So and So on a motor-car."

MR. PERCY FROST-SMITH, who has been associated for some time with the Motor Traction Company, Limited, has resigned his position, and joined the Houk Automobile Company, Limited.

MESSRS. T. S. MCINNES AND COMPANY, LIMITED, of Glasgow and London, have acquired the agency for this country for the Mathot explosion recorder, of which an illustrated description was given in our issue of March 15th last.

AT the monthly meeting of the Mold Urban Council last week attention was called to the dangerous manner in which motor-cars were driven about the streets of Mold. It was decided that a clause be added to the bylaws that the speed of motor-cars in the town be restricted to six miles per hour.

THE Clingoe Automobile Syndicate, Limited, has been registered, with a capital of £300 in £1 shares, to carry on the business of motor and motor-car manufacturers. The first-managing directors are Messrs. C. E. Curtis (chairman) and J. Clingoe, and the registered office is at 93-94, Long Acre, W.C.

The Bexhill Speed Trials.

F

THE OLDEST AUTOMOBILE ASSOCIATION IN ENGLAND.

THE automobile movement owes much to the foresight and energy of Sir David Salomons, Bart., and no particular work of his has been more lasting than the establishment of the Liverpool Self-propelled Traffic Association. This body, which, as is generally well known, has devoted its chief attention to the development of motor-vehicles suitable for heavy haulage, was formally inaugurated on October 1st, 1896, when the Earl of Derby, in response to a deputation

able for heavy haulage, was formally inaugurated on October 1st, 1896, when the Earl of Derby, in response to a deputation

THE EARL OF DERBY, THE PRESIDENT OF THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.
(Brown, Earner & B. L.)

of the members who waited upon him at the Liverpool Town Hall, consented to become president. Prior to this, indications of activity had been shown in arranging an address on the subject of "Motor-Vehicles for Heavy Traffic" by Mr. Worby Beaumont, who visited Liverpool on September 9th of the same year. The opening meeting of the first session saw Sir David himself down in Liverpool to meet the local members and give them a most interesting paper at the Liverpool Royal Institution, an historic building which is the home of many learned societies. The programmes for the first and

second sessions were confined to papers dealing with the early experiments and other interesting matters arising out of the investigation which the Association had taken in hand.

Then came a departure which marked an epoch in the life of the Association and in the progress of heavy automobilism both for England and the civilised world. This was the holding of competitive trials for goods vehicles. The chief object of these trials, the first of which took place from the 24th to the 27th May, 1898, was "to arrive at a type of heavy motor-wagon suitable for trade requirements in Liverpool and neighbourhood, which shall be capable of economically taking the place of horse haulage, and of competing with the existing railway rates, in the transport of heavy loads of goods over considerable distances." Awards amounting to three prizes of £100, £75, and £50 were offered, to be made at the discretion of the judges, and, although the vehicles proved themselves below the requisite standard, it is greatly to the credit of the Association that the whole of these were given in order to encourage the industry. Ten entries had been made by six firms, but only four vehicles were presented for trial. The competing firms were—The Liquid Fuel Engineering Company, Limited, East Cowes, Isle of Wight; the Steam Carriage and Wagon Company, Limited, Chiswick (two

SIR ALFRED L. JONES, K.C.M.G., CHAIRMAN OF COUNCIL OF THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.

MR. E. SHRAPNELL SMITH, THE MON. SEC. L.S.P.T.A., ON HIS MOTOR QUADRICYCLE.

vehicles); and the Lancashire Steam Motor Company, Leyland; whilst the tests consisted of travelling over some 140 miles of Lancashire roads, coupled with manœuvring evolutions. The Automobile Clubs of France and Belgium, the Secretary of State for War (Lord Lansdowne), the Postmaster-General (the Duke of Norfolk), and many English municipal corporations were represented at the trials, whilst the *Times*, the technical and motor journals, and a few provincial papers, followed the competition throughout. The expenses exceeded £1,000, the principal subscribers being the Earl of Derby, Sir Alfred

L. Jones, K.O.M.G., Sir David Salomons, Bart., and Mr. Alfred Holt, to whom the country should feel under a deep obligation for assistance in this vital direction. The members of the Council of the Association have also contributed liberally, both in money and services, and the large amount of time devoted to the work by the three vice-presidents has been specially noteworthy. These three gentlemen are well known in their several branches of engineering, and are all busy men; they are—Mr. John A. Brodie, M. Inst. C.E., M. Inst. Mech. E., City Engineer of Liverpool; Professor H. S. Hele-Shaw, M. Inst. C.E., M. Inst. Mech. E., Mr. Harrison, Professor of Engineering at Liverpool University College; Mr. Anthony G. Lynster, Member of Council Inst. C.E., Engineer-in-Chief of the Mersey Docks and Harbour Board."

The second series of trials was held from July 31st to August 2nd, 1899, and a third from May 31st to June 7th, 1901. On the second occasion, out of eleven entries by ten firms, six vehicles, or two more than in 1898, were presented for trial, whilst in 1901, out of thirteen entries by eight firms, eleven vehicles were presented for trial. These vehicles indicated a satisfactory growth of this new British industry. The competing firms in 1899 were—Bayley's, Limited, London; T. Coulthard and Company, Limited, Preston; the Clarkson and Capel Steam Car Syndicate, Limited, London; the Lancashire Steam Motor Company, Leyland; and the Steam Carriage and Wagon Company, Limited, Chiswick (two vehicles); in 1901—The Lancashire Steam Motor Company; the Thornycroft Steam Wagon Company, Limited (two vehicles); T. Coulthard and Company, Limited; George F. Milnes and Company, Limited, London; Mann's Patent Steam Cart and Wagon Company, Limited, Leeds; Simpson and Bibby, Manchester; and C. and A. Musker, Limited, Liverpool. On the last of these occasions, which, we understand, will be the final trial of the kind, no less than five Government departments were represented officially, viz., the Secretary of State for War (Mr. Brodrick) by a deputation of six officers, the President of the Local Government Board (Mr. Walter Long), the India Office, the Board of Agriculture, and the Postmaster-General (Lord Londonderry). Manchester, Blackburn, and other manufacturing centres were embraced by the itineraries.

To nobody more than to the judges of these trials is credit due for the labour connected with them. The gentlemen who, in order to assist the movement, gave their valued services were:—Sir David Salomons, Bart., Dr. Boverton Redwood, F.R.S.E., Professor H. S. Hele-Shaw, F.R.S., Mr. Everard R. Calthrop, M. Inst. C.E., M. Inst. Mech. E., Mr. S. B. Cottrell, M. Inst. C.E., M. Inst. Mech. E., Mr. Henry H. West, M. Inst. C.E., M. Inst. Mech. E., whilst the two principal observers, acting under the judges and Mr. Shrapnell Smith, were Mr. Henry Fowler, Assoc. M. Inst. C.E., M. Inst. Mech. E., and Mr. E. A. Rosenheim, B.Sc., A.I.E.E. The reports on the trials, which have been fully noticed in the *Motor-Car Journal*, form a most interesting and valuable collection of facts bearing upon that branch of self-propelled traffic which, in the near future, must have a considerable bearing upon the prosperity of the country. The editor, Mr. E. Shrapnell Smith, who was the hon. secretary to the Association and the organiser of the trials, has now resigned from the Association on his appointment as general manager and secretary of the Road Carrying Company, Limited. To him the cause of automobilism in general, and the Liverpool Association in particular, owes much.

In looking through the records of the work done by this pioneer body, we are struck, among a host of fruitful labours, by the tenacity with which the question of increasing the present 3-ton tare limit has been pursued. Several reports have been drawn up on this subject, and recently a memorial has been framed by the Association at the request of the Local Government Board, conveyed through the Automobile Club. On October 25th last, the President of the Local Government Board, the Right Hon. Walter H. Long, M.P., honoured the Association by attending their meeting in Liverpool, when the judges' report

on the third trials was presented, and by receiving a deputation of their members in reference to this restriction. Briefly put, the legal motor-wagon of to-day cannot carry more than $4\frac{1}{2}$ tons upon its own back, and that only on good roads, if the structure is to have a reasonable life, and those who have studied the matter closely ask for more freedom, coupled with a limit of total moving weight and per unit of tread. This regulation would be a much more sensible one than the arbitrary limit upon the weight of the empty vehicle, which never can be tested without serious inconvenience to all concerned, and which is no guarantee of the total weight which is the factor affecting external objects.

With six years' "history" behind them the members of the Liverpool Self-propelled Traffic Association have now reached the end of a stage in the career of that body, namely, the position of having to pronounce a benediction upon Heavy Motor Traffic. From this time forward, it is expected that the Association will be conducted more upon Club lines, although its watchfulness over the interests of heavy automobilism will be in no way relaxed.

THE QUEREY CARBURETTOR.

THE two illustrations given herewith show respectively a general view and a section of a new carburettor which has lately been brought out in France by M. A. Querey, of 119, Rue de Montreuil, Paris. The petrol passes into the apparatus by the pipe A, the quantity of spirit allowed to pass being regulated by the screw valve B G. In the lower part of the apparatus is another needle valve C, which by means of the spring E normally keeps the petrol inlet closed. A deflecting plate is fitted at D, while the necessary air is taken through

adjustable openings at F, fitted with wire gauze. In operation the suction stroke of the piston overcomes the power of the spring E, and, opening the valve C, allows a certain quantity of petrol to pass; at the same time air is sucked in through the openings F, and the spirit and air are intimately mixed by means of the deflecting plate D, ere the explosive charge is drawn to the motor through the opening I. A jacket, H, surrounds the apparatus, through which a portion of the exhaust gases is allowed to pass in order to warm the carburettor. It is claimed for the apparatus that it is absolutely odourless, and that it works equally well in wet as in dry weather.

TO-DAY (Saturday) the members of the Irish Automobile Club will hold a run from Dublin to Malahide.

A FIVE-MILES motor-cycle handicap is included in the programme of the Bury St. Edmunds B. and A.C. sports, to be held on Friday, June 27th.

MR. H. RAMOISY, formerly with the Auto-Carriage Company, Limited, the agents for the Bardon cars, has been appointed manager of the garage and repair depot of the London Motor Garage Company, Page Street, Westminster.

IN an announcement in the *Daily Telegraph* we notice the Cockburn Hotel at Bexhill made known the fact that it was opposite the finish of the motor-car trials. The Hotel Riposo advertised that it had the finest position on the motor course.

THE Daimler Motor Company, Limited, have just issued an interesting booklet entitled "The King's Choice," in which illustrations and descriptions are given of the cars they have supplied to King Edward.

A NOVEL electric searchlight for field service has been fitted up by the Second Signal Corps of the New York State Militia.

A motor-car is employed for transportation and producing the power to run the generator which supplies the current for the light. A trailer, containing a one-kilowatt generator of the Sprague type, is attached to the motor-car, and is provided with a $3\frac{1}{2}$ -inch pulley. When it is desired to operate the light the vehicle is stopped and jacked up in the rear, the pulley of the generator being then driven by a belt from a rear wheel of the vehicle. Power is thus generated to run a 50-volt, 10-ampere lamp. A marine projector is used, having a seven-inch Mangin mirror.

CONTINENTAL NOTES.

BY "AUTOMAN."

M. JENATZY, of Brussels, whose combination petrol-electric car attracted attention some time ago, has recently completed a 75-h.p. petrol car, of which an illustration is published herewith. The vehicle is fitted with a four-cylinder engine, the transmission being chainless—that is to say, the power is conveyed from the gear-box to the rear axle by a longitudinal shaft and bevel-gearing. The car was intended for the competitions held at Nice recently, but it was not allowed to run, as, when it was weighed by the competition officials, it was found to exceed the 1,000 kilos. limit. Everything possible was done to reduce the weight. The

jubilant at having succeeded so well in the competitions for petrol—with the exception of the competition for cars weighing 25 cwt. or more, which is a class of cars long since abandoned on the Continent. There is no doubt that from a French point of view the result is important, but it is to be hoped that from an English point of view the result will have also as great an importance. Nothing could have been a better object lesson to the English manufacturers, and next year we shall probably see English cars more than holding their own in open competition with foreign makes.

THIS is a doctrine I have been preaching in these columns steadily for more than a year, and if once the real situation becomes understood by the English manufacturers, the importation of French cars will be greatly diminished and England in its turn

M. JENATZY ON HIS 75 H.P. RACE.

[Allgemeine Automobil Zeitung.]

upholstery was pulled out, the extra seat removed, and even the bonnet done away with, so that finally M. Jenatzy took his place upon the scales on what was, as will be seen from the illustration, virtually a *chassis* surmounted by a single seat, arranged on a light angle-iron cross frame. Even then the vehicle was too heavy, and was consequently disqualified from taking part in the competitions. M. Jenatzy, however, made a number of private trials in the neighbourhood, the results of which are reported to have been less satisfactory in the way of speed than had been anticipated.

THE results of the Bexhill kilometre competition have been the subject of a great deal of comment amongst automobilists on the Continent, and the publicity that has been given to the event by French journalists will, no doubt, help to make this an annual event of importance from an international point of view. The French makers are naturally

will begin exporting. The only way for England and English manufacturers to get a serious portion of the world's automobile trade is to recognise the necessity to beat French cars in international competitions. The world's trade will certainly follow the winning makers, and the agents who now buy foreign cars will be quite as ready and better pleased if they can sell English ones.

SOME months ago I wrote that we could still hope for the Paris-Vienna motor-car race, and possibly the Gordon Bennett contest. A few weeks later I said that after the elections the French Government would authorise these contests, and I am now glad to be able to announce that, unofficially, consent has been given, and the great event will take place on the 28th and the following days of June. Great prominence will be given to the use of alcohol, and no doubt the principal prizes given will be for cars that are driven by this product. The Government is to be con-

gratulated on the wise decision that they have come to, which means an enormous increase to this important industry. It is an open secret that the Paris-Berlin motor-car race of last year was the cause of the doubling of the Mors works, and this enterprising firm has got options on the land surrounding its works with a view to enlargements on a vast scale.

THE 40-H.P. PANHARD DRIVEN BY MAURICE FARMAN IN THE "CIRCUIT DU NORD."

ON Saturday last the Alcohol Exhibition was opened in the Galerie des Machines of the Exhibition of 1900. The vast hall is filled with alcohol-driven motor-cars and stationary engines, puffing and panting, and doing various pumping and useful work. There is one point which is patent to everyone entering the exhibition, and that is the absence of a smell of petrol. Alas! the substitute is several shades worse, as far as smell is concerned. Burnt alcohol is very disagreeable. The exhibits consist principally of the motor-cars which took part in the Circuit de Nord, but there are also on view other cars. There are also a great many alcohol engines and apparatus for the application of alcohol to heating and lighting. In the centre of the hall there is a track round which the motor-cars are giving experimental runs. On Sunday, M. Leon Serpollet's sympathetic lieutenant, M. Hubert Oliver, gave me a run round in the latest racing car, but it is needless to say the speed was not a record one.

TALKING of Serpollets, the great difficulty was the water question, and I remember, in the Paris-Berlin race last year, the arrangements which had to be made for the supply of water at comparatively short stages. This difficulty, M. Oliver tells me, has been overcome in a great measure, and I was astonished to hear that in returning from the Bexhill trials he went from Boulogne to Paris without taking water. This is surely enough for anyone.

LAST week an Automobile Exhibition was inaugurated in Berlin under the presidency of the Prince of Hohenlohe-Oehrengen. There was a brilliant assembly, including Generals Becker, Von Hahnke, and Von Schubert, and the Prince of Hohenzollern. As no German event is complete without a banquet, the evening was passed at the Hotel Kaiserhof, where a hundred guests

listened to the speeches, in which the great success of last year's Paris-Berlin race was not forgotten.

THERE is a rumour that the Brazilian Government do not mean to allow the efforts of Mr. Severo towards the solving of the problem of aerial navigation to remain unproductive through the tragic death which put an end to them as far as the aeronaut himself was concerned. It is said to be their intention to cause to be built another balloon of the navigable type on the same plan, but with other motive power with which there would be no risk of a conflagration. An electrical motor is suggested, but this would be a retrograde step, as the Brothers Renard proved long since that until electricity can be stored in a more economical manner as far as weight is concerned there is no chance for it to secure the conquest of the air. There is, however, no reason whatever that a motor driven by petrol should not be fitted to a navigable balloon on Severo's principles, and in such a manner that there should be no danger, or rather no possibility of fire. His notion of having his propeller on the axis of the gas vessel is interesting, and experiments on this subject would be instructive.

THE alcohol competition and exhibition is the subject of much discussion in the daily papers owing to its importance from a national point of view. The *Matin* has devoted a leading article to the subject, in which it points out that the utilisation of alcohol for the creation of motive power is the solution of the great problem which has from time immemorial pre-occupied mortals, namely, the storing of the sun's rays and their transformation into power, light, heat, and electricity. All this is directly due to the introduction of the automobile, and if, in the short space of time, this industry has made such wonderful progress—for it must be remembered that the trade is barely seven years old—what will the situation be at the end of this decade, when the Gautier de Clagnys of France, together with the Dogberrys of England, are buried in oblivion, and the trade is allowed a fair and open field?

THE WOLSELEY TOOL AND MOTOR-CAR Co. inform us that the 10-h.p. Wolseley, which took part in the Dashwood Hill Competition, was stated to have used eight gallons of petrol in the C (Hill) trial. This should be three gallons, as it would be quite impossible to use the former amount with one of the 10-h.p. motors.

It is announced from New York that a receiver has been appointed to take charge of the affairs of the Milwaukee Auto-

THE 10-H.P. GEORGES RICHARD RACING VOITURETTE WHICH WON THE DE LA WARR CUP AT BEXHILL.

mobile Co., Milwaukee, Wis. The appointment was brought about by the action of four of the largest creditors. The receiver has been authorised to conduct the business for the present, operating the factory and disposing of the stock in hand.]

THE Motor-Car Exhibition at the Agricultural Hall.

CONCLUDING NOTICE.

FIG. 159.—THE BROOKE 10-H.P. DOUBLE PHAETON.

IN a recent issue we referred briefly to the new cars of Messrs. J. W. Brooke and Company. As they comprise a number of special features, their exhibit at the Show, although in the gallery, was continuously surrounded by interested motorists. A well-finished double phaeton (Fig. 159) was staged, as also a 10-h.p. chassis, and specimens of several of the parts used in these cars. The rectangular frame is constructed of channel steel. In the fore part of this, under a bonnet, is set the engine, its position being at right angles to the method adopted in the Panhard type of cars. The flywheel is set to the left and outside the crank chamber. The motor, of which two sectional views are given in Figs. 161 and 162, has three cylinders which are cast in one piece with their heads, and mounted on an aluminium crank chamber. The latter is arranged in such a way that the lower part can be readily removed, allowing the pistons to be withdrawn, or the crank-shaft bearings examined, without separating the cylinders from the other portion, and without disturbing the crank-shaft itself. The three crank pins are set at angles of 120 degrees to each other. The flywheel at the one end and the spur wheel (which drives the half-speed shaft) at the other end are fixed to the crank-shaft on cones, and are also held in position by small keys and lock nuts. The cam shaft lies inside the crank chamber and the exhaust valve operating cams are forged solid with it. At the flywheel end of the cam shaft is the commutator for the electric ignition. The cylinders are 90 mm. diameter, and the stroke 120 mm., the engine developing about 10-h.p. at 750 revolutions per minute. The inlet valves are fixed in

such a way as to be readily removable, the exhaust valves being immediately below. The exhaust passage communicating with the valves passes from end to end of the cylinder casting. The inlet valves themselves are of the Estcourt type already illustrated in the *Journal*, they being fitted with two springs, the inside one of which does not come into action until the valve is lifted to a certain extent. The engine is fixed to the frame by drop brackets, cast solid with one of the crank chamber castings. The governing device is entirely a new departure. The exhaust passes into a cylindrical chamber (Fig. 163) and presses against a diaphragm held up by a spring. This diaphragm is connected by a light rod to a drilled sleeve communicating with the induction pipe, and can be made to diminish the gas supply to the same in any desired degree. The principle upon which it works is as follows:—Whenever the speed of the motor increases, the volume of exhaust gases passing from the engine also increases, and consequently the pressure in the system of pipes leading them to the silencer must rise accordingly. A branch from the exhaust pipe leads into an open chamber, which is fitted with a needle-controlled exit and with a small piston, sliding in a cylinder formed at one end of the chamber. This sliding piston is normally held in its inner position by means of a spring, the compression of which can be adjusted by a screw and locknut. The passage through which the exhaust gases enter into the chamber is controlled by a check valve, normally held on its seat by another adjustable spring. There are, therefore, two ways of adjusting the relative pressure in the governor chamber in relationship to the speed of the engine.

Either the amount of gases which would normally pass the check valve can be adjusted, or the rate at which the gases escape from this chamber through the holes can be varied. It will also be seen that the displacement of the piston depends on the pressure in the chamber itself, and upon the tension of the spring. The piston is directly connected with a piston throttle valve, which regulates the opening in the admission pipe. A guide carries the piston rod and prevents any leakage of the exhaust gases into

FIG. 160.—PLAN OF BROOKE CAR.

the explosive mixture. The rise of pressure in the exhaust pipe as the engine speed increases, is alone utilised to throttle the passage of the explosive mixture to the explosion chambers. An accelerating pedal in front of the driver is provided, this operating against the action of the governor in much the usual way. This pedal is also connected to an air pump by which the pressure in the petrol tank is maintained. Before starting the motor, a few strokes of this pump are sufficient to give the necessary pressure in the tank while, after starting the car, the ordinary action of the driver's foot upon the accelerator pedal is sufficient to maintain the pressure in the tank. In order to avoid excessive pressure a small relief valve is placed beside the pressure gauge on the right-hand side of the dashboard. The water circulation is effected without the use of a pump, it being on the Estcourt natural circulation system. The cooler consists of aluminium headers, into which Clarkson radiator tubes are fitted. The top of the cylinder jacket is closed by an aluminium plate, having a double outlet pipe leading from the jacket to the cooler. A large tube connects across the top of the two upper headers, this tube carrying a special fitting at its centre, which provides means for filling the water system from above, and also provides a vent to a drain-

FIGS. 161 AND 162.—SECTIONAL ELEVATIONS OF BROOKE THREE-CYLINDER MOTOR.

pipe beneath. Two gallons of water are carried, and this is stated to be sufficient to run the car almost continuously. The carburettor is of the float-feed constant level spray type and requires no adjustment. The ignition is by high tension electricity comprising accumulators, induction coil, and ordinary sparking plugs.

The sparking can be advanced or retarded by means of a rack on the steering pillar. The silencer is placed under the frame at the rear of the car; it is made of sheet-iron with aluminium ends. Between the motor and the silencer a valve is fitted into the exhaust pipe, which can be opened at will by the driver. When opened it allows the exhaust gases to pass directly from the motor to the atmosphere, and enables the driver to listen to the exhaust and to thus ascertain whether all the cylinders are working regularly. Coming now to the transmission, there are three forward speeds and one reverse, all worked from one lever. The power is conveyed from the engine to the first-motion shaft in the gear box through a friction clutch and a Renold silent chain. The clutch is leather-lined; it is made with a ball thrust, and is, as is usual, operated by a pedal. On the first motion-shaft, in an oil-tight gear-box, are carried three chain-wheels, having various numbers of teeth. The three chain-wheels are connected with three corresponding chain-wheels, running loose on the countershaft, by Brampton chains. On the bosses of these chain-wheels are the female halves of positive clutches which engage with clutches sliding on feathers on the countershaft, so that any one of the loose chain-wheels may be connected with its fellow on the countershaft as desired. The first, second, and third speeds are, therefore, obtained by locking the corresponding chain-wheel train to the countershaft by the sliding clutches above alluded to. The countershaft is further furnished with a toothed pinion on the end corresponding to the similarly-equipped end of the first-motion shaft, and a third pinion, being

FIG. 163.—THE BROOKE GOVERNING DEVICE.

caused to mesh with these two while the chain-wheel clutches are disengaged, provides the reverse. The differential gear is on the countershaft and is enclosed in the gear-box. The speeds given by the change gear fitted on this car are ten, twenty, and thirty miles per hour. From the ends of the countershaft the power is conveyed to the rear road wheels by means of duplicate chains in the usual way. Three pedals are fitted. One acts on the governor and forms the accelerator; one controls both the clutch on the engine-shaft and an ingenious brake on the outside sprocket-wheel on the first-motion shaft. The third pedal works a water-cooled band-brake on the differential gear-sleeve, and also disengages the main clutch. A hand lever also actuates band-brakes on the hubs of the rear wheels. An interesting feature of the latter is the device employed for equalising the pull. The brake lever on the driver's right-hand side is connected to a rocking shaft passing across the frame, and the ends of this are attached in the usual manner to the double-acting band-brakes. The ends of these two brakes, instead of being fixed, are connected to horizontal bell-cranks which are pivoted to the rear corners of the frame. The free ends of the bell-cranks are connected together by an adjustable rod passing across behind the frame; a running joint with right and left hand threads permits of an easy tension adjustment of both brakes at any time, and the connecting-rod always equalises the pull of both. Lubrication is effected from a multiple-feed aluminium lubricator in the centre of the dash

board. The lubricator consists of a box divided into eight compartments, each of which has a gauge-glass to show the level of the oil inside it, and from each of which an adjustable feed leads by a separate pipe. The box is filled through a single opening. To ascertain that a proper amount is being fed to the various parts, the driver has only to watch the rate at which the oil descends in each glass. The dashboard is of unusual construction; not only

FIG. 164.—CHASSIS OF MEREDITH 10-H.P. CAR.
(See issue of May 10th, p. 218.)

does it carry the cooler, but it also forms a wind shield, a very important adjunct at high speed. The wings of the dashboard are neatly adapted as tool cupboards. The steering is irreversible and by worm and quadrant, a Brooke inclined steering-wheel being fitted, which serves as a convenient receptacle for light articles. The petrol tank is carried under the frame of the car at a level lower than the carburettor, and is consequently under pressure. The road-wheels are of the artillery type, 36 inches in diameter, and fitted with pneumatic tyres. The weight of the vehicle complete is 18 cwt. We may add that the double phaeton was driven to the Show from London, the journey of 120 miles being made without a stop.

A large display of accessories, etc., was made by the United Motor Industries, Limited, who exhibited many small and useful articles. One excellent little novelty was the "Castle" knife and tool chest, a convenient combination of twenty-five different serviceable tools for motorists, all of which will be found requisite by motor owners at some time or other. It is a thoroughly practical article, and its usefulness is already borne testimony to by well-known automobilists who have bought it. It is carried in a neat pigskin case, which can be folded into a space about six inches by four inches. The exhibits included acetylene lamps, paraffin and oil lamps, electrical fittings, voltmeters and ammeters, horns, coils, radiators, water-pressure gauges, etc. An aluminium jack, with set of tools, by which the jack can be actuated without getting under the body of the car, was also shown, as well as the Dupont two-speed gear, a detailed description of which, with illustration, has already appeared in the *Journal*. The "Castle" electric motor-bicycle lamp and accumulators were on view, and attracted much interest. The lamp can be run off separate accumulators or off the sparking accumulators, if so desired,

and also serves as a testing lamp for the charging of the sparking accumulators. The "Basse-Michel" coils were shown in convenient boxes, with protected terminals and falling front flap. The "Brissard" water-cooled head, with flanged cylinder barrel, was on view, fitted with special piston, by which a 2½ or 2¾ De Dion motor can be transformed into a 3-h.p. water-cooled motor, the cylinder fitting on the ordinary De Dion base chamber. Space prevents a full enumeration of the many other features of interest shown by the United Motor Industries, Limited, but mention must be made of the selection of motor clothing on view. In fact, there is nothing that a motorist requires that he cannot obtain from this firm.

Accessories of various kinds formed the staple portion of the display made by Messrs. Steiner and Co., who showed a new motor-horn which can be so adjusted as to only be sounded by the proper person. By a slight turn it can be rendered inoperative—an ingenious feature which will be appreciated by many motorists who have to leave cars in the roadway in populous centres. Lamps, motor-horns of the ordinary type, flexible tubes, etc., completed a useful display.

Mr. O. C. Selbach, who is the agent in this country for La Carrosserie Industrielle, found many inquirers at the stand whereon he exhibited some excellent specimens of the work of that Paris concern which was responsible for the carriage work of "La Passe Partout." The exhibits included a delivery van, convertible to an ordinary brake, a car to seat two persons in front and four at the rear, a charette to seat four, with a detachable rear part, etc. All these were characterised by a degree of finish and effective design which was notable.

Our readers have been kept so well informed with regard to the development of motor-bicycles that the features of the display made by the Singer Cycle Company, Limited, are too well known to need detailed description on the present occasion. Their exhibits comprised specimens of their motor-bicycles for ladies and gentlemen, the Singer motor-tricycle, the Singer motor tandem tricycle, the Singer tri-voiturette, and also two examples of the Singer motor-carriers, one fitted up as an ordinary carrier for tradesmen's delivery purposes, and the other adapted to the requirements of dairymen, with a churn and basket attached—two exhibits which were the objects of much public interest. The Singer motor-wheel which is fitted to the company's cycle has already been described in these columns, thus rendering further notice unnecessary in this connection. The bicycle fitted with a 2½-h.p. engine has a pump for lubricating purposes, enabling it to be fed without dismounting. The Singer tandem tricycle was also shown. This has a 2½-h.p. engine, the additional framing and pedals for the rear rider adding little to the weight and expense. The Singer tri-voiturette is another adapta-

FIG. 165.—THE SINGER MOTOR TANDEM TRICYCLE.

tion whereby the tricycle is made to carry a passenger who pedals not, and who is seated behind in a well-upholstered armchair. In one form the passenger is carried backwards, low down, with the footboard just clearing the ground, and in the other type the idle passenger faces forward, the chair being raised higher up. Certainly the Singer Company provided a very attractive stand,

Popular with visitors was the display of the City and Suburban Electric Carriage Company, whose vehicles have found much favour among the aristocracy. In addition to exhibiting several vehicles of excellent design, workmanship, and finish, attention was drawn to the facilities afforded by the company for housing, maintaining, and insuring electric carriages. The tariff adopted by the company shows one inclusive charge for rent, supervision, oiling and washing, renewing batteries, tyres, and working parts, supply of electrical current from the company's mains, insurance against damage to the carriage, and also against injuries to third parties, while the benefit of a *garage* that is open all day and all night is a not inconsiderable advantage. Among the exhibits shown was a Cee-Spring Grand Victoria of a particularly handsome design, well adapted for fashionable service. A private omnibus to seat fifteen people, and having a capacity for running thirty-five miles on one charge was also on view. This vehicle has a splendid appearance, being fitted with bevelled plate-glass windows and a bevelled plate mirror within the omnibus; 3 in. solid rubber tyres are fitted; while the upholstery is of an effective character. A limousine, forming a protection for the passengers during bad weather, and capable of conversion to a wagonette, was shown, while public interest was manifestly centred in the replicas of vehicles supplied to the Queen, the Dowager Empress of Russia, and other distinguished people. Victorias, Surrey phaetons, *tonneau* phaetons, and mail phaetons were also exhibited, as well as the three-seated landaulette shown in Fig. 166. The mail phaeton is a standard type of vehicle capable of running about sixty miles on one charge. A seat of full width is provided at the back. This can be made interchangeable with the other, thus enabling four persons to be accommodated on the vehicle. The maximum speed of this vehicle is sixteen miles per hour. In all these carriages the running gear is similar, two $2\frac{1}{2}$ -h.p. nominal motors being generally found sufficient. The quadrangular tubular frame is jointed at the corners, so that the wheels can rise without being strained when going over obstacles. The motors are pivoted on the rear of the frame, and they drive by spur-gearing on to gear rings attached to the hubs of the rear wheel, the outside of the rings forming drums for the band brakes. Regarded as a whole, the exhibit of the City and Suburban Company was one of the most attractive in the Exhibition.

At the stand of the Automobile Supply Company a "Peerless" voiturette fitted with an 8-h.p. engine was shown, as well as a *chassis*. The frame is of weldless steel tube with steel lugs. The lugs carrying the engine and gear-box are planed longitudinally and transversely at one setting, in order to ensure accuracy. The engine is of the single-cylinder vertical type, the bore being $3\frac{3}{4}$ in. and the stroke $4\frac{1}{2}$ in. The cylinder is cast in one piece with the head, and is water-jacketed. The inlet valve is so arranged that it can be entirely removed, and it is so made that its spring is at all times

accessible. A float-feed carburettor, with butterfly valve for throttling the mixture, is provided. A centrifugal pump is fitted in front of the lower half of the crank-chamber, being driven from the crank-shaft by the same spur-wheel which operates the half-speed cam-shaft. A universally-jointed shaft transmits the power from the gear-box to the rear live axle by means of a bevel pinion and wheel. Wheel-steering is provided, and two powerful brakes are fitted. That on the gear-shaft is actuated by a foot pedal, the other being controlled by a lever located in a convenient position for the driver's hand. Three forward speeds are provided, and a reversing gear is provided by means of an intermediate wheel brought into mesh as required in much the usual manner. This is operated by a separate lever, which is attached to the right-hand side of the frame, in the centre of the car, lengthwise. It is claimed that the "Peerless" car will attain a speed of about thirty miles an hour on the level, and is an excellent hill-climber.

AMONG the well-known tyres exhibited was the Talbot, as shown by the Maison Talbot. Pneumatic as well as solid tyres were displayed by the company, the latter being of the wired-on kind, some being also gripped by the rims. The pneumatic tyres shown

were on the thickened edge system.

The Holborn Tyre Company was represented by a selection of tyres for motor-vehicles, which are distinguished by having a broad base pointed in an arched fashion towards the tread. When in position the inner tube is of elliptical section, the longer radius being radially to the wheel. A very thick covering of canvas surrounds the inner tube, and a pointed soft rubber tread is provided outside the covering. An outer case of hard rubber encloses the whole. In order to ensure the tyre being kept in position, an inner

rim is embedded in the canvas covering of the inner tube by a bolt and fly nut passing through the rim of the wheel. These tyres thus have many elements of strength and durability, which have led to their adoption by a number of motorists.

The presence of the first motor used by M. Santos Dumont led many to the stand of Mr. O. C. Selbach, who showed various sizes of Buchet single, two, and four-cylinder motors, including the last motor ordered by the aeronaut. In the Buchet motor a leading feature is the placing of the exhaust valve in the head of the cylinder, so that the escape of the exhaust gases may be as free as possible. Among minor improvements which have been made, we noticed the cam shaft is now entirely enclosed, and the governor works on to a throttle valve. In addition to being utilised for air-ships, these motors were also shown coupled direct for driving dynamos, pumps, and launches. Some splendid forgings by Messrs. Bail, Pozzy, and Co., and Messrs. Malicet and Blin's change-speed gears were included in a collection of axles, springs, brackets, etc., as well as of lubricators. Among the latter we noticed some specimens of the Dubrulle type.

FIG. 166.—THE CITY-SUBURBAN CO.'S THREE-SEATED ELECTRIC LANDAULETTE.

The leading exhibit on the stand of Messrs. Brown Bros., Limited, was the Brown petrol light car. The motor and mechanism are mounted on independent frames, so that any type of carriage body can be fitted—*tonneau*, spider, phaeton, two-seated, etc. The engine, which is set under a bonnet in the fore part of the frame, has a double water-jacketed cylinder and develops 8 brake h.p. at a speed of 900 revolutions per

operated by lifting the lever of the front-wheel rim brake. In addition to the foregoing Messrs. Brown Bros. made a display of motor-tricycles and quadricycles, trailing cars, motor-car chains and chain wheels, horns, bells, lamps, and accessories of every kind for automobilists and motor-vehicle builders. In fact, they are in a position to supply everything from a small screw to a complete vehicle.

FIG. 167.—THE BROWN 8-H.P. DOUBLE PHAETON.

minute. By use of the accelerator it will, it is claimed, work up to 9-b.h.p. The governor is of the well-known Daimler pattern. The electric ignition, which is of the positive "make and break" pattern, is fitted with means of advancing and retarding the sparking. The water circulation is maintained by pump and radiator. Three speeds forward and a reverse motion controlled by a single lever are provided, the power being transmitted through a pedal-operated clutch to a gear box of the Panhard type, and thence by universally jointed shaft and bevel gearing direct to the rear axle. Hand and pedal controlled brakes are fitted, while the steering is actuated by an inclined hand wheel. The car weighs complete about 12 cwt.; it is made with either *tonneau* or double phaeton body, an illustration of the latter being given in Fig. 167. In addition to complete cars, Messrs. Brown Bros. are also making a speciality of supplying chassis, or parts (which are made on the interchangeable system), to enable carriage builders and others to build up cars on similar lines. The Brown 1½-h.p. motor-bicycle introduced last year has undergone modification in certain details. The machine itself is built up of B.S.A. parts and has a specially strengthened head. The air-cooled motor is supported on the top of the lower cross tube of the frame, the crank chamber being at the bottom bracket. Messrs. Brown claim that by placing the engine in this position the frame is really strengthened than otherwise, the whole being exceedingly rigid. A Roubeau spray carburettor is now used, and as the coil and accumulator are carried under the saddle the tank is small, lubricating oil being carried in a separate tank above the top tube. An exhaust-valve lifter, actuated by a Bowden wire, is fitted, so that there is only the timing lever on the top tube. The twisting switch handle has been given up in favour of a contact breaker, which is

A type of vehicle that excited a great deal of attention on the score of novelty was that shown by the Lanchester Engine Company, Limited. It is different in almost every particular from the ordinary petrol car, the engine, instead of being placed, as is now usual, in the front of the car, being located under the front seat, one cylinder being on each side of the driving shaft, which is parallel with, and runs down the centre of, the car, to the live axle at the back, the throw of the two cranks thus being at right angles to the line of motion. The motor has two opposite cylinders, 5½ in. bore by 5½ in. stroke, developing 10-h.p. at a normal speed of 700 revolutions per minute. There are two crank shafts passing through the crank chamber; the one is arranged above the central axis of the two cylinders, and the other

below. Each piston has three connecting rods, two of which are connected to one crank shaft and the central connecting rod to the other crank shaft. Each crank pin, therefore, has three connecting rods driving it. The two crank shafts revolve in opposite directions, and they are connected by a pair of spur wheels at the rear end, a short spur wheel meshing on the under side of the lower one transmitting the power through the speed gear to the rear live axle. A cam shaft is placed

FIG. 168.—THE LANCHESTER 10-H.P. TONNEAU.

parallel with the cylinders, and is driven by spiral gearing from the upper crank shaft. It carries exhaust and ignition cams at each end. It also drives a multiple-feed oiler by worm gearing, the oiler being placed above the cylinders and being connected with pipes to the various parts of the mechanism. The cylinders are air-cooled, two fans, driven by frictional contact with the flywheel, forcing air to the radiating fins on the cylinder walls. A governor which acts on the exhaust valves is fitted,

and the speed at which this comes into operation is regulated by an accelerator controlled by a foot pedal, enabling the engine to run up to 1,200 revolutions per minute when desired. The impacts on the cranks upon which the connecting rods engage are equalised by the fitting of two flywheels, which rotate in opposite directions. The flywheels are carried—one on the upper crankshaft and one on the lower. The two crank shafts are connected by helical gearing. The current for the electrical ignition is produced by a special form of magneto. The forward flywheel carries two permanent magnets on its inside face, which rotate round a fixed armature set on a sleeve carried on the lower engine shaft. The windings of the armature are fixed to insulated collectors, conducting the current by an insulated bar from the armature to the igniter, which is connected up by a switch. The sparking plugs are secured in the explosion chamber by a quick fastening gas-tight locking joint, resembling somewhat the breech-block of a rifle. The plug itself is made up of a steel bush carrying within it a sparking wire insulated by mica. The outer end of the ignition conductor is furnished with a spring which when struck by the striking arm on the engine shaft causes the sparking points to make contact within the explosion chamber, upon the releasing of which the circuit is broken, causing a spark. All the connections between the magneto and the plugs are of solid steel, no ignition wires of the ordinary form being used. A wick-type carburettor is employed to furnish the mixture, this being provided with a branch pipe from the exhaust. Double silencers are employed, while the petrol tank is fitted with a float worm indicator, which shows at a glance how much spirit remains in the tank. Three speeds forward and a reverse are provided; the power on the high speed is transmitted direct from the engine to the rear live axle, through a friction clutch and worm gearing; an ingenious form of epicyclic change-speed gear for the lower speeds is provided, this running in oil. The brake is fitted on the countershaft, this being brought into action by merely pulling the clutch further back against a fixed block, a plan which also facilitates changing the gears. The front axle is tubular and of great strength, while the wheel-base is remarkably long, being 7 ft. 9 in. Tiller steering, located at the right side of the driver, is employed. The frame of the car is constructed of channel steel. The body is supported on the front and rear axles by short plate springs, while between it and the frame are interposed rubber buffer springs, with the view of reducing vibration. The road wheels are of the cycle type, shod with pneumatic tyres. The car, complete, weighs about 18½ cwt. The company's exhibit comprised three handsome examples, one a *tonneau* body in black, lined white, with imitation cane panels (Fig. 168); a *tonneau* finished in black and green, white lined, with glazed 'bus top over the *tonneau*; the remaining car was in white, lined red, with red upholstery.

Being fitted to the King's car, much interest was naturally felt in the Goodyear double-tube tyres, which were shown in sizes for voituresses or large cars. Form, construction, and materials employed are the three factors which have ensured the success of the tyre, which differs considerably from the ordinary pneumatic. The outer tube terminates near the felloe of the wheel in two thick rings of solid rubber, which come together and are held in position by detachable rims. These latter are bolted to the felloe of the wheel, it being sufficient to remove the rim on one side to enable the tyre to be taken away or placed in position. Assuming the rim on the left to be removed, the tyre with the inner tube in position is slipped on, the rim is replaced in position, secured by the nuts to the felloe, and the tyre bolt is then inserted, passing through the inner part of the solid rims, thereby securing the tyre being held strongly in position, after which it is pumped up in the ordinary manner. A flap of rubber is so provided as to avoid any injury to the inner tube at the point where the thick rims are brought together. Throughout the whole circumference of the solid portions of the tyre are a number of thin wires crossing one another. As the tyre is pumped up the expansion acts upon the twisted wires, tending to shorten

their length. The tyre is thus gripped more firmly to the felloe of the wheel. Strands of fabric are also moulded in the inner portion of the outer case. When it is pumped up the whole weight of the tyre is transmitted through the rims to the felloe. There is no pressure between the curved edges of the rims and the outer case.

FIG. 169.—SECTION OF GOODYEAR TYRE.

The inner tube is also above the line joining the rims, a fact which is said to account for the improved resilience of the tyre. The outer case of the Goodyear tyres is built up on a ring steel core under heat and enormous hydraulic pressure, the ultimate volume of the finished outer case being less than half that of the rubber employed to form it. The case is then vulcanised. The motorist cannot afford to be unfamiliar with improvements in tyres, and hence the interest naturally felt in that of which a section is shown in Fig. 169.

Having in view the advance that has lately been made in connection with steam cars, the exhibits of the Steam Car Accessory Syndicate were of more than ordinary interest. These included an automatic water-level regulator, by which the operator is relieved of the constant watchfulness with regard to the mirror, which is one of the things to remember in driving a steam car. The regulator is made to operate with a seamless copper float operating a valve which is placed in the by-pass pipe leading from the pump to the tank. When in work the apparatus is fixed directly opposite the glass gauge in the inside of the carriage and on a level with the water in the boiler. By the adoption of this device gauge-cocks become unnecessary, and

FIG. 170.—THE "SYNDICATE" CONDENSER.

even with a broken glass gauge the driver is still able to ascertain the level of water in the boiler by lifting the arm, which raises the float enclosed in the chamber and allows it to drop back upon the water, thus showing the level of the water in the boiler. Another exhibit on their stand was the apparatus to which the firm have given the name of the "Syndicate" condenser. This is of extremely neat appearance, and does not obtrude upon the

view when fitted to the car, its location being between the front axle and the fuel tank. It is light and efficient, and does not put any back pressure on the engine. The pattern shown in Fig. 170 is 24 in. long, and is elliptical in section, 6 in. by 9 in. At this stand, too, was shown the paraffin burner for steam-cars introduced by the Syndicate. We have had an opportunity of seeing this in actual use, and can thus testify to the simplicity of the device. The apparatus consists of a blue flame wick lamp, placed in a convenient position near the burner, having a coil over it. One end of this coil comes from the container, the other leads to the mixing chamber of the burner. The lamp is lighted in precisely the same way as any other wick lamp, the flame being turned up as high as it will go without smoking. In five minutes' time the main burner can be lit. In the mixing chamber there is a small steam jet that automatically controls the combustion of the oil vapour as soon as the steam is raised, so that no further attention need be given to the fire. No spirit has to be employed, the fire can be turned out at any moment, and will light itself again as long as the pilot light is burning, and the lamp alight. In these generators the paraffin is converted into gas before it reaches the main fire; therefore a constant heat can be applied to the vaporising coils, thus avoiding all choking up of the pipes and nozzle; the fire burns quietly without smoke, odour, and without fouling the boiler tubes. The fire is turned completely out automatically at a given steam pressure; the car can therefore be left for several hours, and the boiler will always maintain its full working steam pressure. The burner can be worked on 20 lbs. of air pressure.

Clincher tyres of the solid and pneumatic type were shown by the North British Rubber Company. The latter, being intended to fit Michelin rims, are provided with an inside flap across the rim to obviate the risk of wear on the inner tube. On this stand inner tubes were exhibited which had been vulcanised after construction so as to show no rubber joint. Solid tyres with diameters varying from one inch to $3\frac{1}{2}$ inches were also exhibited by the North British Rubber Company, which were evidently of interest to practical people. The $2\frac{1}{2}$ -inch section of the solid "Clincher," and the two-inch wired-on, are specially suitable for the heavier class of vehicles, reducing the liability of punctures to a minimum. The sizes of the rims have been carefully considered by the makers, and in the event of covers being required to replace others which have been worn, the "Clincher" sizes will probably be found suitable.

We have already referred to the motor-cars exhibited by Messrs. Philipp and Co. Elsewhere in the Show the firm displayed an assortment of axles for cars, differential pinions and forgings, hubs, ball bearings, springs, steering-gears, radiators, lubricators, artillery wheels, lifting jacks, etc. A large show of lubricators was made, special attention being drawn to Hecht and Koepp's No. 6 lubricator. In this each outlet can be separately regulated, a lever being provided on the right side to control the supply. The tank is made of gun-metal, and the general design is neat and convenient. At this stand were the "Sauerbier" radiators, in which the fins are endless, forming one body only when fitted to the tubes. A strip of copper is corrugated on its one edge to assume a spiral form, and the spring-like lengths into which it is made are threaded over the pipe and soldered in place. The "Sauerbier" circulating pump was also shown by Messrs. Philipp and Co. It is of the rotary type, consisting of a cylindrical chamber, in which is placed a piston of very small diameter. This is caused to rotate in contact with the inner wall of the cylinder by means of an eccentric action. At the upper side of the cylinder, the inlet and the outlet pipes are placed a short distance apart, and between them, within the cylinder, a blade is pivoted in such a way that it slides in and out of a corresponding slot in the piston as this goes round. The blade fits against the flat end walls of the cylindrical chamber, as also does the piston, and in this manner water is drawn from the one pipe and forced out of the other. The pump can be driven in either direction, as the inlet and outlet pipes are interchangeable, according to the direction of rotation. A fine show of fittings was made on a stand on the ground floor, these including back live axles with differential gear and fixed hubs, speed gears with

wheels forged from the solid, the teeth being cut and case-hardened; steering gears which can be fitted in two positions by turning round the worm-screw in the interior of the case by unscrewing the nut; and artillery wheels made of hickory, oak, ash, or acacia wood. Messrs. Philipp and Co.'s display also included the Kamper two-cylinder petrol engine. The cylinders are $4\frac{1}{2}$ in. bore by 5 in. stroke, and the engine runs at a normal speed of 800 to 1,000 revolutions a minute. These motors are made in three sizes having single cylinders, and in three sizes of two-cylinder variety. The cylinders are cast solid in one piece with their heads and water-jackets.

The Union Steam Pump Company, for whom Messrs. A. Pullen and Company are the agents in this country, made a special feature of the "Moore" independent pump for steam-vehicles. In the pump of the single-acting plunger type the steam end is tapped in three places for steam and one for drip. The plug can be changed to any one of three places, or the drip can be taken from any one which is not used for steam. The steam end can be located in any horizontal position; the water end is then located so that the delivery shall be vertical as regards the valves. The exhaust can be taken out at any angle. In the Moore air-pump the greatest efficiency is obtained when handling cold air, as constant running causes the air-cylinder to heat. This type of pump is tested to force from 80 to 100 lbs. of compressed air in a $2\frac{1}{2}$ gallon tank in $2\frac{1}{2}$ minutes under a steam pressure of 250 lbs. Another type of pump introduced by the Union Steam Pump Company is a combined boiler and air pump, the general design of which is similar to that of the single pump, with the exception that the pump end is made double, the plunger with a yoke on the outside end being packed on the water side, and an enlarged piston being on the air side. The plunger end is used for feeding the boiler and the enlarged piston for the air. These pumps certainly have features which should commend them to the careful attention of all owners of steam-vehicles.

The Clipper Pneumatic Tyre Co., Ltd., made a good show of the Clipper Continental motor tyres so well known to motorists. From the stand they issued a useful little pamphlet of instructions applying to Clipper Continental tyres, and also to Clipper Michelin tyres, of which the company holds a full stock of all sizes.

The Shrewsbury and Challiner Tyre Co., Ltd., drew attention to the Cup tyres, with which their energies are closely associated. In this there is no cutting of the indiarubber by the metal rim, and it is claimed that their use obviates the fear of skidding on the tram lines—an occurrence of which the motorist goes in wholesome dread. The Albion Wheel and Tyre Works, Limited, had a good display of artillery wheels on the stand, all classes being exhibited, from the lightest voiturette wheel to heavy iron-tyred wheels for lorries, etc.

THE International Motor Car Company, of New York-report that they have already shipped a dozen Toledo steam carriages to South Africa, three of which were ordered by British army officers.

THE Automobile Club of Namur and Luxemburg has just been formed at Namur, Belgium. It is organising a hill-climbing contest for June 1st, and a kilometre race and consumption trials for June 2nd.

A SERVICE of electrical motor-omnibuses on the Lombard-Gerin system has just been started between Marseilles and the suburb of Allauch. The cars take the current from an overhead conductor the same as trolley tramways.

MESSRS. W. H. JOHNSON AND SON are bringing out a new swing crank for use on motor-bicycles. The idea is that once the engine has started the two cranks may be brought into the same plane and thus serve as comfortable foot-rests.

MESSRS. HAYTER AND COMPANY, motor and cycle engineers, through circumstances over which they have no control, viz., Corporation City improvements, have been compelled to find a new location, and have secured premises at 115, Anlaby Road, Hull.

THE JONES INLET VALVE FOR PETROL MOTORS.

MR. LEONARD JONES, of North Finchley, sends us particulars of a new inlet valve for petrol motors he has recently designed and patented. A represents the valve seating and casing; b the valve; d is a hood with slots e e on opposite sides in which the wings f f on the long nut g engage; the shaft h passes out from the engine, and is either actuated by a governor or other mechanism from the driver's seat; p is a pin which passes through the casing into the slot c, on the valve spindle, to prevent it rotating; it can, however, be removed should the valve require regrinding. It will be seen that the object of the arrangement is to adjust the amount of lift given to the valve b. The action which takes place is as follows: When the hood h is revolved,

it in turn revolves the nut f, but at the same time allows it to travel down the thread, and thus reduce the amount of lift between l and k, the shoulder of the nut and valve respectively. This in turn limits the amount of opening round the valve seat at m. The arrangement can be fitted to any motor, and is claimed to add considerably to its efficiency and economy of petrol; it is probably one of the simplest methods yet devised of throttling the inlet.

THE Mayor of Maidenhead (Mr. W. F. Good), with the town clerk and the surveyor, made a trip by motor-car to Wokingham last week to inspect some steam rollers.

THE Collier Twin Tyre Company, Limited, have recently received from the Wolseley Company the outer covers of the tyres used in the recent Glasgow to London trip. They are intact with the exception of a cut on one tyre, which does not, however, extend beyond the first layer of strengthening canvas.

WE understand that two of the electric cars which took part in the Bexhill races were charged at the Tunbridge Wells electricity works on their way down to Bexhill. The arrangements for charging the batteries of cars are excellent, and as the town is midway between London and Bexhill, no doubt many electric cars will in the near future avail themselves of the accommodation provided.

HERE AND THERE.

A SERVICE of motor-cabs is about to be started in Copenhagen.

AN automobile club has lately been formed in Moscow, Russia.

A PUBLIC service of motor-cars is about to be started between Jaen, Ubeda and Baeza, Spain.

A SLIGHT fire occurred the other day at the Firefly Motor Works, 72, High Street, Croydon.

THE Piccadilly Motor Company, Limited, has been registered with a capital of £2,000 in £1 shares.

THREE motor-cars were to be seen in the Ambassadors' Court in connection with the levee last week.

A SERVICE of motor-cars leaves the Cycle Chalet at Bexhill, for Hastings at frequent intervals during the day.

GENERAL LEW WALLACE, the author of "Ben Hur," is now a motorist, he being the owner of an electric runabout.

MESSRS. CLARK AND CO., of Station Road, Doncaster, undertake repairs to motor-cars, and also stock petrol.

A GREASE-CUP from a Napier car has been found near the Great Central Garage, Limited, and will be given up to the owner on application to 300-306, Marylebone Road, N.W.

THE Berlin Maschinenbau Gesellschaft (Schwartzkopf), of Berlin, are now building heavy steam vehicles on the Thornycroft system, for the German market.

FODENS, LTD., has been registered with a capital of £100,000 to acquire the business carried on by Messrs. Foden, Sons, and Co., Ltd., at Sandbach, Cheshire.

THE Regent Street Garage, Limited, has been registered with a capital of £2,000, to establish, maintain and conduct garages for the storage and repair of motor-vehicles.

FROM Herr F. Walloch, of Berlin, we have received a copy of the 1902 Adressbuch der Automobil-Industrie, which, *anglicised*, means a directory of the motor manufacturers and traders in Germany. The book appears to be very complete, extending as it does to over 240 pages, and including the names of over 1,000 firms. It should prove useful to all having trading relations with motor-car and motor-accessory firms in the Fatherland.

FRANK WOOD, 4, Albert Cottages, Hammersmith, brought an action, under the Workman's Compensation Act, against his employers, Messrs. Davis and Allen, of Tabernacle Street, E.C., for damages for injuries sustained. The plaintiff had been riding one of the defendants' motor-bicycles on a track, and, falling off, his knee was injured. The judge, the Hon. Alfred Russell, said the Act did not apply to this particular case, and gave judgment for the defendants.

MR. FREDERICK WALKER, of Oxford, is to design a new air yacht for M. Panuzzi. It will be 230ft. long, with frame similar to that of an inverted ship, and with a rigid car. The twin propellers, 11ft. in diameter, and forward and above the centre of gravity, will be driven by electric motors through a dynamo attached to the spindle of a turbo-petrol motor of special design and 55 h.p. Compressed air, used with the petrol, will keep the temperature very low, and it is estimated that the vessel will attain a speed of twenty-five miles an hour.

MESSRS. R. J. MCREEDY AND COMPANY, LIMITED, have sent us a copy of the new edition of "The De Dion Voiturette: Its Mechanism and Management." The booklet deals in simple and untechnical language with the mechanism and working of the De Dion voiturette. The general hints and explanations will be of use to every motorist, as they are based directly on practical experience, and are applicable to the driving of almost every motor-vehicle. The book has been entirely re-written, and an additional chapter has been added detailing the special points of the latest De Dion car. Numerous illustrations are given, and every effort has been made to render the book a complete guide.

DURING the week a trial has been made in London of an electrical motor-bus of American design and construction.

THE Motor Traction Company, Limited, fit Michelin, Continental, or any other kind of tyres required to their cars.

PETROL and lubricating oils are now being stocked by Mr. Richard Thirkill, Canal Bridge Ironworks, Leeds Road, Huddersfield.

THE Electric Ignition Company have just brought out a sparking plug specially intended for use on the motors of motor-bicycles. The plug, which is known as the "E.I.C." Midget,

and of which an illustration is given herewith, has been tested for some time on a 1½-h.p. Minerva and other motor-bicycles, and has, we understand, given very satisfactory results.

A NEW puncture-preventing and anti-skidding device has, we hear, been experimentally fitted to Mr. Mark Mayhew's Panhard car.

AUTOMOBILISTS passing through Surrey on Saturday kept one eye on the weather, and one upon the policemen they saw upon the roadway.

THE construction of motor-cars has lately been taken up in Sweden, by the Scania Engineering Works, Malmo, and the Soedetelge Engineering Works, Soedetelge.

A COMPANY has been formed at Versailles with a capital of £40,000, to be known as the Société des Automobiles Gillet-Forest (Gillet, Forest, Bocande, and Company.)

THE Automobile Club of America has been seeking a good piece of road, about two miles in length, in the vicinity of New York, for the purpose of holding a speed contest.

COL. HOLDEN, Col. Crompton and Mr. E. Hutton have been appointed a sub-committee by the Automobile Club to consider the practicability of a series of trials of tyres.

THE Motor Power Company have just completed a 16-h.p. Napier vehicle with lorry body for Messrs. Mayhew's flour mills at Battersea; it is intended to carry a load of five tons.

MR. G. IDEN calls our attention to the fact that he was not the driver of the M.M.C. car that did so well in the recent Glasgow to London run, as reported in our issue of the 27th ult.; nor has he ever appeared in the Huntingdon police-court on a charge of furious driving.

ON the main road from Barnsley, the Times Cycle and Engineering Works, at 34, Stanley Street, Sheffield, are prepared to help all motorists in distress. A Leeds correspondent informs us that on a recent Sunday he required two new inlet valves for his 8-h.p. car. Being near these works he called, and the proprietor willingly made him the valves required.

A FEW copies yet remain of the catalogue of the last Motor-Car Exhibition at the Agricultural Hall. These will be sent post free for one shilling from the offices of the Exhibition, 39-40, Shoe Lane, E.C. The catalogue contains the addresses of 250 firms in the automobile industry, with a full range of their specialities, and is thus a useful work of reference.

"HOLIDAYS in Eastern Counties" is the title of a well-illustrated and chattily written little book, prepared by Mr. Percy Lindley, for the Great Eastern Railway Company, whose enterprise has opened up many delightful resorts in the Eastern Counties of England. Although motorists are not likely to discard the pleasures of their pastime for the joys of railway travel, they will find much of interest in this little publication.

A MOTOR made by the Daimler Company has been fitted to a launch for the British Government, and now being used in connection with the artillery practice at Shoeburyness.

THE garage adjoining the Aquarium, Westminster, which has hitherto been for the exclusive use of members of the Automobile Club, will, from June 1st, be open to all motorists under the name of the Automobile Garage.

THE month of June should furnish an opportunity for amateur photographers, and we shall be glad to receive reminiscences of interesting motor trips in the form of photographs of automobile interest.

THERE was a good attendance of members of the Motor Cycling Sunday, the 8th prox., there will be a club run to Maidstone. Club at the run to Dunstable on Sunday. On Sunday next the run will be to Guildford, meeting at the Angel at Ditton at noon. On

THE Anglo-French Motor Syndicate, Limited, has been registered with a capital of £10,000 in 9,995 shares of £1 each and 100 "B" shares of 1s. each, to promote a company for the purpose of acquiring and working a motor-car business as now carried on at Suresnes, France, and elsewhere.

A SPANISH correspondent informs us that for some time past a public service of steam omnibuses has been running between Santiago and Coruna, a distance of forty-two miles. The journey is made in five hours, with stops *en route* at Ordenes and Puente Lago. Five 35-h.p. De Dion steam vehicles are used in the service, each having accommodation for twenty-two passengers.

SPRATT'S PATENT, Limited, the well-known dog biscuit makers, are getting some good publicity from a motor-car recently purchased by them. The car is handsomely decorated in gold, and is timed to make its appearance in a district just before an agricultural show takes place. The main function of the car is to whip up the agents and keep them well supplied with show-cards.

WE illustrate herewith Messrs. Salsbury and Son's new Tail Lamp. This is a very substantial lamp made with a bail to facilitate removal, and is fitted with a ruby slide; the latter is easily detachable and enables the lamp to be used at any time for inspection purposes. The lamp is made to burn paraffin; it is provided with a strong screw grip socket on the back, by which the lamp is fixed securely to the bracket and cannot become accidentally detached.

ABOUT twenty cars took part in the meeting of the Lincolnshire Automobile Club on Saturday, the motorists present including Sir Hickman Bacon, Major Herrington Josse, of Grimsby; Dr. Cragg, of Billingham; and

Mr. Padley, Market Rasen.

MR. J. A. BAIN, of Sheffield, made a balloon ascent from Peel Park, Bradford, along with the celebrated aeronaut, Mr. Spencer, a few days ago. When the time fixed for departure came there was a downpour of hail, but the balloon got safely away, and was carried over Bradford towards Halifax, the aeronauts being treated to Arctic weather. For the first part of the journey a snowstorm raged, which, at a height of 3,200 ft., was cold enough for Arctic clothing; but coming earthwards a sudden but pleasant change from cold to temperate weather was experienced, and a change also of currents carried the occupants over Huddersfield to the village of Farnley Tyas, where a safe descent was made. The balloon was a new one of 35,000 cubic feet capacity, and performed its work admirably.

MECHANICAL FLIGHT UP-TO-DATE.*

By SIDNEY H. HOLLANDS.

CHAPTER VIII.—SOME BIRDS, FLYING INSECTS, AND WINGS.

AN idea prevails largely in the popular mind that a bird's flight is a very intricate—if not inscrutable—performance; in fact, almost beyond human mental grasp. Doubtless this is in a sense, and to an extent, true, in as far as it applies to the complex muscular movements attendant on animal locomotion in general; but the main principles of natural flight are far from being so, or from being inimitable artificially. Nor are birds so powerful as is commonly supposed. The wings of the average bird of flight are certainly, proportionately, more powerful than a man's arms, but then the main portion of the bird's power is concentrated there, where it is wanted; while its legs are relatively weak.

FIG. 1.—HUMMING BIRD (HOVERING).

The natural provision of muscular power in birds varies largely in amount; broadly speaking, it varies in inverse proportion to the size of the bird. Thus, while the pelican is provided at the rate of only one horse-power per 231 lbs. weight, the tiny humming-bird (Fig. 1), at the other end of the scale, is endowed with a ratio of about one horse-power per 20 lbs. weight; more than eleven times the proportionate muscular power of the pelican. The former powerful little gem has such wing velocity that it can sustain itself in one position, in still air, for over a minute at a time, being then poised in air with its body standing nearly vertically; not beating directly downwards with its wings, but using them as flexible inclined surfaces vibrating horizontally; constituting really an intermittent vertical lifting screw action.

This instance, together with that of certain flying insects, are the analogies we have in Nature to the oft-proposed vertical "ascensional screws" for flying machines, and should emphasize the fact of the impracticability of that system. If we were unhappily restricted to the humming-bird, and say the dragon fly, as our models, the case for aviation would be utterly hopeless, as these marvellous little beings would be quite inimitable on an enlarged scale, or on a small one for that matter, particularly in view of the enormous power-ratio and its duration. When we step from the humming-bird to the larger flying insects—and in one sense it is only a step—we find still greater proportionate power; and apparently, *i.e.*, as far as we can determine by observation, for actual power-tests of any accuracy are at present

* All rights reserved.

impracticable with small flying insects, the power-ratio goes on increasing inversely. We have startling evidence that the common beetle is enormously powerful, even in its legs, as it has been seen to move a stone of over a pound in weight, and so crawl from beneath it (which is fairly comparable to a man shifting an average locomotive engine by his unaided muscular efforts); while the common flea, although not a flying insect, jumps 200 times its own length. However, reverting now to the birds, Starkweather, an American aviator, computed that six-sevenths of the duty of a bird's wings is to keep its body suitably sustained and elevated, the remaining seventh being used in propulsion. Now as propulsion is a means of sustentation in birds, as it should also invariably be in aviation, it is scarcely correct to divide the power out in this way. Brearey wrote:—"The sustaining power obtained in flight must depend upon certain laws of action and reaction between relative weights; the weight of a bird balanced, or finding an abutment against the fixed inertia of a far greater weight of air, continuously brought into action in a given time. This condition is secured, not by extensive surface, but by length of wing, which, in forward motion, takes a support upon a wide stratum of air extending transversely to the line of direction. The pelican, for example, has wings extending out ten feet. If the limits of motion imparted to the substratum of air acted upon by the incline of the wing be assumed as one foot in thickness, and the velocity of flight as thirty miles per hour, or 2,640 feet per minute, the stratum of air passed over in this time will weigh nearly one ton, or 100 times the weight of the body of the bird, thus giving such an enormous supporting power that the comparatively small weight of the bird has but little effect in deflecting the heavy length of stratum downwards, and therefore, the higher the velocity of flight, the less the amount of 'slip,' or power wasted in compensation for descent."

With reference to the foregoing lucid and accurate statement of the case, I will add that when large birds have been seen skimming along quite close above smooth water, it has been observed that the surface has not been ruffled in the least by their transit, which fact is good and interesting evidence that during rapid flight the air does not give way beneath them, but becomes more of the nature of a solid support. Two admirable examples of remarkably easy and long-sustained flight are those of the wandering albatross and the "frigate bird" (Fig. 2); indeed the staying power of the former great bird in flight is unequalled throughout ornithology. Abounding and fairly distributed over the Southern Ocean, this bird very rarely rests on the water. During terrific storms even it is seen now cleaving its way through the whirling and scudding clouds, and now serenely floating on its outstretched, wide-spreading pinions, which to all appearance are quite motionless. The lateral wing-stretch of this bird

FIG. 2.—FRIGATE BIRD.

is between fourteen and fifteen feet, while the maximum width of wing is only 8½ inches. It is this extraordinary ribbon-like formation of wing that gives the albatross its transcendent powers of passive flight (its wing area is relatively small). In active flight, it by no means excels, nor does it need to, when so amply endowed in the other direction. With such capacities of sustentation it required so exceedingly small muscular effort that the bird is even said to sleep on the wing. We know the albatross to be quite weak compared with birds of active flight, and that when on the deck of a ship, or on land, a more pathetically helpless creature can scarcely be imagined; and yet, by drawing on extraneous natural forces, in spite of its own muscular weakness, it can perform aerial feats and evolutions impossible to the powerful short-winged birds of active flight.

(To be continued.)

CORRESPONDENCE.

THE FRENCH ALCOHOL TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to a letter signed "C. E." in your last issue, in reference to the French alcohol trials, your correspondent seems to be unaware that the nominal horse-power of various cars is arrived at through custom, and the 40-h.p. engine referred to is probably an engine giving 45 to 50 h.p. on the brake, whereas the 20-h.p. engine of the voiturette type is one, judging from its size and the speed it runs, which would give nearly 40 h.p. on the brake, so that really the discrepancy in horse-power is not very great. But, again, the two types are entirely dissimilar, the nominal 40-h.p. weighing 1,000 kilos and the nominal 20-h.p. weighing 650 kilos. Then, again, your correspondent does not seem to have taken into consideration any stoppages that either of the cars may have had during the run. Nor, again, does he take into account that the greatest factor for absorbing horse-power at high speeds is wind resistance, and that for a speed over forty miles an hour a very little gain in miles an hour means a very great increase in horse-power. How he can possibly compare mechanical application of motive power with the various disturbing factors that I have mentioned taken into consideration I fail to see. If he wants to get a real comparison, it will be best to do so on a very steep hill where there will be the least possible wind resistance.—Yours truly,

S. F. EDGE.

SIR,—The query of "C. E." in the last issue of the *Journal* opens a question of great moment to anyone contemplating the purchase of a motor-car. The following extracts, from the report of the last hill-climbing competition held by the A.C.G.B.I., may perhaps throw some light on the subject:—10-h.p. Georges Richard: number of cylinders, 2; diameter of cylinder, 100 mm.; stroke, 110 mm.; weight of car with passengers, 15 cwt. 1 qr.; speed on hill, 10.77 miles per hour. 12-h.p. Gobron-Brillie: number of cylinders, 2; diameter of cylinder, 95 mm.; stroke, 110 mm.; weight of cars with passengers, 25 cwt. 21 lbs.; speed on hill, 8.59 miles per hour.

A short mathematical calculation shows that the Georges Richard car has not only greater cylinder capacity, but nearly double the cylinder capacity per cwt. of weight to be propelled than the other car has. Does not this mean that it is the most powerful car of the two, in spite of the fact that it is credited with less horse-power? That it shows superior mileage on the hill seems to support this view. I am unable to get at the cylinder capacity of the cars mentioned by "C. E." in his letter, but suggest the above as a possible answer to his question.—Yours faithfully,

J. ORFORD.

WARNINGS TO MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to my letter, Mr. Scriven, in your issue of the 24th inst., argues from wrong premises. He infers that I stated that the police had warned him. What I did state was that action against motorists had only been taken when warnings to them had proved of no avail. That Mr. Scriven was one of those proceeded against was his misfortune. Regarding Mr. Kershaw's letter, I would say that we are speaking of the road immediately leading into Stanningley, less than half a mile in length. The first curve (from Bradford) is, I grant, open and easy to see round, but if Mr. Kershaw can see 200 yards round the second curve, then he is gifted with remarkable eyesight, as there are several buildings blocking the view. As, from the tone of your correspondents' letters, I gather they have somewhat of a wrong idea of the reasons prompting my first letter, I would like to state that I wrote in the true interests of our sport; that my letter upheld the police (to apparently an unpalatable degree) is due to a feeling of sheer justice. Granted that some of Mr. Kershaw's remarks in his last paragraph are correct, what we have to remember is this—the police are bound to carry out the law, however silly that law may be, and that they will carry it out we may be assured, whatever we may think and feel as to the real injustice of it. In the present state of the law as to speed, and the excellent efforts being made by the Automobile Club and others for its revision, it is patent to all that every motorist ought to err on the slow side in town and suburban driving, and so not give our chances away; for, be assured of this, it only requires a few more cases of excessive speed, and perhaps a smash or two, to spoil our chance in this direction, perhaps for years. Another aspect of the case is that prosecutions beget prosecutions; thus one or two get fined in a district, the local "anti-everything" (whose idea of speed is that anything above a pony's amble is forty miles an hour) writes to the paper as to the awful doings of the wicked motorist. The Chief Constable has to take some action, and warns his men to be on the look out, and thus speeds (safe, mind you) which otherwise would not be noticed are made the subject of proceedings. We in Bradford suffered last year because one or two raced about the streets at twenty miles an hour, and turned corners at unreasonable and startling speeds, and, as a consequence, we were under a ban for months. This has now been removed and a reasonable speed arrived at by our cars in city driving. A decent feeling now exists between the police and the majority of us, and it was a desire to foster this that prompted my entering this discussion.—Yours faithfully,

HERBERT A. JONES.

WANTS TO BE A DRIVER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was shown a paper by a friend that contained an account of a motor-car exhibition, at which all the latest machines were shown. The show was over when I saw the paper. If I had known about it before, I think I should have come up to London to see it. I haven't had any motor experience, but when I see a motor I feel that I should like to be a driver. I am fond of machinery, and if I could motor-drive I should not drive to the terror of the public. If I got used to driving I should be careful and take delight in motors. I am writing to you to ask you if any of your readers could get me into motoring. I hope I am not asking too much. Is there any difficulty or danger attached to motors?—Yours truly,

A. R.

THE DASHWOOD HILL TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the recent reports, and the decision in above trials, permit me to call your attention to the following facts. In the first place, a stop of twelve minutes, on account of a broken brake, is placed against me, and the natural inference is that it was my own brake which gave way. As a matter of fact, it was the brake on the car on which my "observer" was riding which broke, and it was at his request that I stopped. Naturally I obeyed, as at starting I was told by the judge to obey the instructions of my "observer." Also, before starting from Lillie Hall an official told me that if the "observer's" car broke down I must stay with him, which I did. On the car breaking down a second time my "observer" instructed me to go on alone. I can only conclude that there must have been some oversight of the Automobile Club's officials in reporting as they did, as nothing went amiss with my Humber motor-bicycle in any way whatever.

Again, the consumption of petrol placed against the machine is quite impossible, except in the case of a leaky tank, and this was not so in my case. I can only say that from start to finish no single detail of the machine gave any trouble whatever.—Yours faithfully,

BERT YATES.

MOTOR CYCLING RECORDS.

At the Crystal Palace track, on the 24th inst., C. A. Barnes, of the Putney Athletic Club, mounted on a Mitchell 2 h.p. motor-bicycle, beat the performance which the American, G. Rogers, recently accomplished for a five-miles spin on the same track by 26.2-5 seconds.

On the following day on an "Excelsior" machine, W. R. Martin reduced this time by 52.1-5 secs., and later in the day A. A. Chase, on a new pacing motor bicycle, fitted with a Motor Manufacturing Company's motor, still further reduced the time. We append a comparison of the times of the three riders:—

	C. A. Barnes.	W. R. Martin.	A. A. Chase.
Miles.	Min. Sec.	Min. Sec.	Min. Sec.
1	1 50½	1 39½	1 3
2	3 31½	3 8½	3 1
3	5 12½	4 40½	4 26½
4	6 53½	6 12½	5 51½
5	8 37½	7 45½	7 16½

FURIOUS DRIVING CASES.

WILLIAM LEE, of 5, Margery Park Road, Forest Gate, was summoned at Stratford, on Saturday, for driving a motor-car at a greater speed than was reasonable and proper. Constable Willard, 378 J, said he saw the defendant in Aldersbrook Road, Wanstead, driving at the rate of at least twenty miles an hour. The defendant emphatically denied that he was going more than eleven miles an hour. He called his nephew, who was with him, and who gave his opinion that the pace was only eleven miles an hour. A fine of 10s. and 9s. costs was imposed.

ALBERT HOLMES, of Easthampstead Park, has been summoned at Wokingham for driving a motor-car at a greater speed than was reasonable and proper, having regard to the traffic, on the Easthampstead Road, Wokingham, on May 6th. Police-constable Finch stated that he was on duty in the Easthampstead Road, near Star Lane, when he saw the defendant drive a motor-car at a terrific speed over the crossing. Witness considered that he was going at about eighteen miles an hour. Witness held up his hand, and the defendant stopped the car. Defendant, on oath, said he was a motor-car driver in the employ of Mr. Holden, of Easthampstead Park. He proceeded through the lane at ten miles an hour, and went over the crossing at between nine and ten miles an hour. There was plenty of room for anyone to pass. The Bench considered that there was not sufficient evidence to convict. The chairman pointed out that defendant was not only forbidden to drive over twelve miles an hour; he had to drive so as not to endanger the public safety. The case under the circumstances would be dismissed.

G. ASHTON-JONSON, 23, Austin Friars, E.C., has been fined £5 for driving a motor-car beyond the legal limit. He was driving a car, with two powerful brakes, down a gentle decline between Guildford and Ripley at about twelve miles an hour. He had a stop-watch, and had timed the last two miles between the milestones, which he had done in eleven minutes—a speed of less than eleven miles an hour. Two constables suddenly stepped out and signalled him to stop, and took his name and address. One said

he had timed the car over a distance of 176 yards, and that the speed was eighteen miles. In the police-sergeant's evidence it was admitted there was no one in sight and absolutely no traffic on the road, that the car was under perfect control, and was pulled up instantly without difficulty.

The driver of a motor-car belonging to Captain Spender Clay, 2nd Life Guards, named Parrish, was fined £2 and costs by the Windsor justices for driving the car faster than twelve miles an hour.

C. H. HALE, of Quorn, Loughborough, has been charged before the North Riding magistrates at Scarborough with having driven a motor-car at a greater speed than twelve miles an hour at Leeberton on May 8th, and also with having refused to stop when requested. It was stated that, as a result of the defendant's refusing to stop, a horse plunged, and the vehicle was damaged to the extent of £1. Defendant then stopped the car, and offered to pay for the damage. In view of his straightforward and honourable conduct, the Bench intimated that they would only fine him a sum of £2 2s., and costs in each case.

WALLACE LEIGH, of Ashurst, Kenley, Surrey, has been before the Uckfield Petty Sessions for furiously driving a motor-car at Fletching, on May 11th. The police alleged that the defendant covered a measured distance of 440 yards in thirty-three seconds. He was fined £1 and 14s. costs.

HARRY COOPER was charged at the Halstead Petty Sessions with driving a motor-tricycle without sounding his hooter, and also with riding the machine to the danger of passengers upon the public highway. The defendant pleaded guilty to the first charge, but denied the second, and in the result was fined 10s. and costs for not sounding his hooter, and dismissed so far as the second summons was concerned.

THOMAS MALLON, Ann Street, Belfast, has been summoned for riding a motor-bicycle through the streets of Belfast at such a rate as to endanger the public. After the defendant had given evidence, William Pemberton declared that it was possible to check a machine of the Excelsior type within a yard when the speed was as high as twenty miles an hour. Mr. Nagle (after consultation with the other magistrates) said it did not matter materially whether the machine was going at 15, 17, or 20 miles an hour; the question was, was the rider going at a furious rate? and on the evidence it appeared that the defendant was. They would impose a penalty of 10s. and costs.

B. FITZGERALD, Duke Street, London, was summoned at Chertsey for furiously driving a motor-car at Egham on May 4th. Inspector West, who proved the case, said the speed was about twenty miles an hour. When he stopped the car the defendant said the noise the car made gave one the impression that it was going faster than it really was. Fined 40s., and 9s. 6d. costs.

BEFORE a Hampshire bench of magistrates Richard Travers Dixon, of Lang Down Firs, Hythe, has pleaded not guilty to a charge of driving a motor-car at excessive speed on the road between Alresford and Alton, on May 4th. Police-constable Percy said he was on duty in plain clothes at 4.15 p.m. on May 4th near the Chequers Inn, Ropley, on the highway leading from Alresford to Alton. He saw defendant driving a motor-car towards Alresford at a furious speed, and, timing him after he had passed a bend in the road, found that he travelled a distance of 260 yards in twenty seconds. Witness was certain of the time and distance, and added that it worked out at thirty-three miles an hour. Col. Stratton Bates questioned the constable at length as to the exact stretch of road, the position in which he was standing, and as to when he took out his watch. On the watch being produced the second hand was found to be broken. Col. Stratton Bates commented on the uselessness of the watch, and expressed the opinion that a map ought to have been produced to determine exactly where the offence was committed. In the position in which witness was standing it would be impossible to tell whether the car was going fast or not, and to get any idea as to time there should have been an observer at either end of the piece of road in question. The police were making use of an obsolete Act. Deputy Chief-constable Silience contested this point, and mentioned a case in which appeal was made on the ground that the watch used was not a stop-watch. The appeal was heard in London on March 13th last, and was dismissed with costs. The Chairman said it was for the bench to administer the law as they found it. There was no doubt defendant was travelling at excessive speed, and he would be fined £1 and 13s. costs.

At the Leicester County Police Court, George Belville, of Stoughton, was summoned on Saturday for driving a motor-car at a speed exceeding twelve miles an hour, at Oadby, on the 11th May. Mr. W. Rowlett appeared on behalf of the police, and Sir Thomas Wright for the defendant. Police-constable Payne said defendant drove the car through Oadby on the previous Sunday evening at the rate of eighteen to twenty miles an hour, and two other witnesses estimated that he was going at that pace outside the village of Oadby. Fined £5 and £1 10s. 6d. costs.

FATAL ACCIDENT.

An inquest was held at Edenham on Tuesday on the body of T. W. Cunningham, motor-car driver, in the employ of Lord Willoughby, M.P., of Grimsthorpe Castle. On Sunday morning the deceased took his brother and two of the Earl of Ancaster's employees for a short run on a 10-h.p. Wolseley car, which he had only driven from Birmingham the previous day, and while descending a small hill at Swinstead the car swerved from side to side, ultimately turned over on its left side, throwing the occupants out. All were more or less injured, and Cunningham died within two hours. One of the occupants, who is an expert driver of cars, considered that the deceased quite lost his head and put on the brakes too quickly. A verdict of accidental death was returned.

THE BEXHILL SPEED TRIALS.

In connection with the Speed Trials at Bexhill, we have received a number of letters from competitors.

The Wolseley Tool and Motor Car Company, Limited, write:—"We beg to call your attention to an error in the published results of the Speed Trials at Bexhill which affects us very seriously. Our 30-h.p. racing car, which competed in Class A (vehicles under 1,000 kilogs.) is placed fourth, and timed at 49½ secs., whereas the correct time should be given as 48½ secs., that is ½ sec. faster than the Mercedes car driven by Mr. Campbell Muir. Consequently the Wolseley should be placed third."

The New Orleans Motor Company, Limited, write:—"In your report of the Bexhill meeting we notice you state the third prize in the 'Appearance' Competition was won by a 20-h.p. Panhard. Would you please allow us to state that it was Mr. A. C. Harmsworth's New Orleans which gained this award. It may perhaps be of interest to state that, in the heat which the Committee ordered to be run between the Gladiator and the New Orleans car before deciding whether the previous heat was a good start or not, our car in beating what was declared to be the winner did the course in 1 min. 7 secs."

The Speedwell Motor and Engineering Company, Limited, write:—"With reference to the steam tourist section of the races at Bexhill, we wish to draw your attention to the fact that, although the races were supposed to be run against time, the second fastest was not recognised. There were two Gardner-Serpollet, two Miesse, and two Locomobile cars entered for this section, and for some reason the two Serpollets had to run together. The loser of this heat was, according to unofficial timing, only four seconds longer than the winner. In the final the Serpollet had to run against the Locomobile, which it beat by nearly half time, yet the Locomobile takes second honours. This is scarcely as it should be, and we would call attention to it, so that it might be guarded against in the future."

THE IDENTIFICATION OF MOTOR CYCLES.

SIDNEY MILLER appeared at the Lawford's Gate Petty Sessions, in answer to a summons under the Locomotives on Highways Act, for driving a motor-bicycle at Filton, on the 11th inst., without having the owner's name and address properly displayed on the vehicle. Police-constable Smith deposed that on the day named he saw defendant in charge of a motor-bicycle at Filton. Witness stopped him and asked him where the name and address of the owner of the vehicle were. Miller replied that they were not on the cycle. He then produced an envelope, wrote his own name and address, and affixed it to the machine. Defendant pleaded that the name of the owner was on the vehicle, but not of the required size. He was unaware that the lettering must be one inch high. Superintendent Cooke stated that the lettering on the machine was about an eighth of an inch in size. Mr. Latham, the magistrates' clerk, explained that it was the first case under the Act they had had at that court. The object of the Act was that a motor-vehicle should be easily identified. The bench decided that as it was the first case of its kind they had had to deal with they would inflict merely a nominal penalty—1s. and costs.

ANNOYING A MOTORIST.

WILLIAM EVERITT, cab-driver, of Caledonian Road, N., has been summoned before Mr. Bros, at the Clerkenwell Police Court, for driving to the common danger. Mr. Staplee Firth appeared to prosecute, and Mr. Pattison defended. Major Bailey, in command of troops in the Isle of Wight, said that on the afternoon of April 23rd he left the Agricultural Hall, Islington, where the Motor-Car Exhibition was being held, with a motor-car. In Rosebery Avenue the defendant drove up from behind with his horse and cab and cut in front of him, necessitating his arresting the progress of the car. From Rosebery Avenue to Shaftesbury Avenue defendant nursed the motor-car, arresting its progress whenever he could, and at other times cutting in front of it whenever the motor-car happened to get the lead. At the Trocadero the complainant called a constable, who took the defendant's name and address. Mr. Bros ordered the defendant to pay a fine of £2 and £2 2s. costs, in default one month's imprisonment.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JUNE 7, 1902.

[No. 170.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE cessation of hostilities should enable motor-car firms to realise the vast possibilities for an export trade that exist in South Africa. Already many motor-cars are in use in the leading cities, and others are awaiting shipment—orders having been given some time ago. Readers will be interested to know that the *Journal* has many enthusiastic subscribers in the new British colonies, and that an English firm has already some cars on the way to the mines near Johannesburg.

The Show Question.

THE history of the Exhibition question receives another chapter this week, the agreement between the Automobile Club and Messrs. Cordingley and Co. having been definitely terminated. As will be remembered, in accordance with the resolution of the trade at a meeting of the Automobile Club in June, 1901, Mr. Cordingley booked the Agricultural Hall for a certain time in 1902 and 1903. The financial obligation thus entered upon, it was understood that no alteration of the arrangements then made would be attempted. Such, however, has not been the case, and in view of the suggestions made that it was likely that the Club would give its name to an Exhibition elsewhere than at Islington, an announcement was made that it was Mr. Cordingley's intention to terminate the agreement with the Club.

No Club Show Next Year.

THE Club entered into negotiations with other show promoters, and just when it was thought that their official Exhibition would take place elsewhere than at the Agricultural Hall, the whole thing collapsed, and the patronage of the Club was withdrawn from the proposed Crystal Palace Exhibition. Exhibitors at the Automobile Show at the Agricultural Hall were so satisfied with the business done that many at once booked space for 1903, and it is evident that the trade intend to rally again at Islington next year.

Abrogation of Agreement.

SEEING that Messrs. Cordingley and Co. had adhered to the arrangement with the Club, and that the resolution of June, 1901, had not been rescinded, an advertisement of the Automobile Club Exhibition appeared last week, which has had the effect of drawing from the Secretary, under the direction of the Club Committee, a statement to the effect that the Club "will not give its patronage or name to any Exhibition so long as the trade were not unanimous on the question of exhibitions." So

that we have now a definite situation, for which the trade will be thankful, as it clears the course, and leaves everyone free to book at the Exhibition recognised by the Automobile Mutual Protection Association, and which will be the eighth of the series promoted by Mr. Cordingley. As intimated last week, the measure of support already accorded is most gratifying, and it remains but to be said that the next great International Automobile Show at the Agricultural Hall will be held from March 21st to 28th, 1903. A list of the firms who have already taken space is given on page xxxi.

An Enthusiastic Motorist.

THE photograph on another page is that of Mr. Holden, late of Eastwell Park, near Ashford, who, with his wife, is well known in London society. He is an enthusiastic motorist, as may be inferred from the fact that his motor stud includes the following:—6-h.p. Mors, 10-h.p. Mors 'bus, 10-h.p. open Mors with special body, 10-h.p. Mors landau, and 16-h.p. open touring car. He has a 15-h.p. Mors on order, as well as a Locomobile.

Brake Trials in America.

THE Chairman of the Technical Committee of the Automobile Club of America has issued a report of the brake tests recently held near New York. "Seventeen different types of motor-car, running at about eight miles an hour, stopped upon signal in an average distance of nine feet. A victoria, drawn by two horses going at a nine mile gait, required seventeen feet, eight inches, and a four-in-hand coach, running at the same speed, required twenty-six feet for stopping. At a fifteen-mile speed the automobiles stopped on signal in an average distance of twenty-nine feet, the victoria in thirty-seven feet, and the four-in-hand in seventy-seven and a half feet. At the twenty-mile speed the motor-car stopped in an average distance of fifty-three feet, and the four-in-hand coach in ninety-one feet." The report adds, "The principal results of the tests were the strong impression produced upon all that the speed of eight miles an hour is very slow indeed; in fact, more so than most spectators realised; and that automobiles can be manoeuvred with great ease and convenience."

The Insurance Question.

No joint action has been agreed upon by the insurance offices as to the insurance of motor-cycles or motor cars, the only strong point of agreement amongst them being the hazard that attaches to them and the obvious inexpediency of risking other property, such as the contents of a private house, by introducing motor-cycles with petrol into the premises. The conditions of every fire office contain a clause that if anything be done on or upon the premises to which the insurance refers, by which the risk is increased, without notice to, and the assent or sanction of the company, the insurance ceases to attach, and it is certainly desirable that the owners of motor-cycles should realise this fact. The insurance companies would prefer to take up a position

which would induce the public to keep their motor-cars and motor-cycles in separate buildings, rather than fix a special rate or frame new conditions. The foregoing represents the official view with regard to what is likely to become an important matter to motorists.

Portsmouth Automobile Club.

THE Portsmouthians had an enjoyable run to Bognor on Saturday last. The cars that started were: Mr. Cox's 8-h.p. Clement—he was accompanied by Mr. Pearson, of Sunderland, one of the head officials of the N.C.U.—Mr. G. Gale's 8-h.p. Daimler, and Mr. F. Irish's Locomobile, and also a number of cycles. Tea was partaken of at the Royal Pier Hotel, the town being reached in a couple of hours. Rain spoilt the run home, but it is a noteworthy fact that on neither journey were there any breakdowns. The Club, which was only formed this year, is thriving well, has now fifty-one members, and proposes affiliation with the Automobile Club of Great Britain and Ireland.

THE "SHROPSHIRE" AND "VIVIENNE" READY FOR THE ASCENT.
Photo by [Argent Archer].

Balloon Ascent at Ranelagh.

At the invitation of the members of the Aero Club, a large number of motorists, occupying about forty automobiles, visited the beautiful grounds of the Ranelagh Club, at Barnes, on Saturday afternoon last, to witness the ascent of three balloons. The first ascent was at 3.30 p.m., and while the preparations were being made the band of the 1st Life Guards played a lively selection of music. The first balloon to rise was the "Graphic," belonging to Mr. Frank Butler, and containing as passengers Miss Vera Butler, Mr. C. F. Pollock, and Mr. J. Holder, this being the latter gentleman's maiden ascent; the "Vivienne" was the next away, in charge of the owner, Mr. Leslie Bucknall, his cousin and Mr. Stanley Spencer being passengers; the "Shropshire" was the last to rise, with Sir Vincent Kennett Barrington, Mr. S. F. Edge, and Mr. Percival Spencer. The day was an ideal one for ballooning, and fine trips were indulged in, the "Graphic" not descending till dark, in Worcestershire, having travelled about 120 miles. Mr. Butler informs us that they had ballast enough on board to last for several more hours. They economised a great deal, by trailing their 250 feet of rope over the fields, etc. To those not expert in aerial travel it is well to mention that at least a reserve of two bags of ballast must be kept for emergencies, and in this instance the passengers on the "Graphic" had considerably more than this quantity.

The "Vivienne" descended at Warwick about eight o'clock, but the "Shropshire" did not go beyond Bicester.

Ranelagh and Afterwards.

AFTER listening to the band for some time and watching the bicycle polo players, the tea lawn being crowded, we drove our car to Sheen House, which just now is looking its best. Returning to town, and the evening being a sultry one, we made up our minds to run down to Brighton. It was after seven o'clock when a start was made, and over forty minutes were wasted in getting to the end of the tram lines along the Clapham Road. These are "up" for the purpose of laying cables, and the road is altogether in a shocking state. However, once free, we got along well, and duly passed through Reigate, where it commenced to rain. A couple of miles further on the not unusual familiar sounds of a loose chain gave warning of a puncture. The cause was a sharp flint stone, which had become embedded in the outer cover and then worked through. Putting in a fresh inner tube in the rain is not the pleasantest of occupations—but needs must, etc. A halt was made for lighting up at Crawley, and a fast run into Brighton was made, this latter place being reached a minute or two after ten, the rain still pouring.

Through Sussex Lanes.

THE Brighton headquarters of the Automobile Club are at the "Old Ship," and here we stayed. Since our last visit Mr. Burkhardt, the courteous manager and enthusiastic motorist, has built at the back of the hotel a large garage, with pit, etc., and in addition stocks petrol, etc. Sunday broke gloriously fine, and so the services of the car were requisitioned to take us *via* Newhaven to Lewes, through the most charming of country lanes. Here the day was spent, and the return journey made without incident. Monday was sultry but fine, and a non-stop run through to London was made, town being reached in time for luncheon. At several of the villages the children were met marching in procession, the church bells were ringing, and the countryside generally seemed to have given itself up to rejoicing.

Photographic Experiences.

THE motor-car races at Bexhill led to a large number of exposures by users of hand-cameras, not, it is to be feared, with great success in the case of the fastest and therefore most interesting cars. Speeds of upwards of fifty miles an hour are beyond the range of the average shutter, and practically only the users of focal plane shutters stood any chance, especially as, with the usual contrariness of events, the fastest times, observes the *Telegraph*, being done when the light was poor. However, many optimistic camerists snapped off their plates with a zeal worthy of brighter prospects of satisfactory results. Most of them would probably never have dreamed of exposing a plate under similar conditions of shutter and light on an express train, but they seemed to regard the speed of the cars as something quite different.

Motor-Cars in Parliament.

MOTOR-CARS have loomed large in Parliamentary chronicles of late, and by inaugurating a debate on the subject while the Home Secretary's salary was under discussion, Mr. Norman has rendered a service to the movement. He commenced his attack by asking a question with regard to the case of Mr. G. C. Ashton-Jonson, reported in last week's *Journal*. Mr. Ritchie declined to review the decision of the Guildford magistrates, seeing that there was so much conflicting evidence in the case. Upon that Mr. Norman waited his early opportunity and again raised the matter when a resolution to reduce the Home Secretary's salary was before the House.

Attempts at Humour.

IN the discussion Mr. T. G. Bowles made some amusing comments, starting with the suggestion that the fine should have been £10 instead of £5. If the Home Secretary went to magistrates and said the Government did not approve of the way they administered the law, some magistrates would return a very rude answer indeed. The contention of Mr. Norman was that there should be one law for an empty road and another law for a road that was occupied. To this Mr. Norman replied, and said in his view the law ought to regard the people on the road and not the road itself. Mr. Bowles added that automobiles were not prevented from going at a speed of 30,000 miles an hour for the sake of the surface of the road. The law was made for the safety of the people on the road. When these gentlemen rode this fatal and never-to-be-forgotten 176 yards, how did they know some old woman, cat, or dog was not going to turn into the road? To his mind the magistrates came to a most sound decision on the evidence of a conscientious policeman, who took the time accurately. The speech may have raised laughter, but it did not convince anyone.

Mr. Ritchie's Reply.

REPLYING on the discussion, Mr. Ritchie said that this was a case of conflicting evidence. Did Mr. Norman really seriously wish him to reverse the decision of magistrates in a case where they heard the evidence and he (Mr. Ritchie) did not? The magistrates who heard the evidence were the best people to decide as to what penalty should be imposed. The proper course was to leave the matter in the hands of the properly constituted tribunals, and he should be taking upon himself a responsibility which he ought not to exercise if he adopted the suggestion of the hon. member. Mr. Scott-Montagu wound up the debate, declaring that in the case under notice a great injustice had been done. There were benches of magistrates who carried their dislike to motor-cars to such an extent as to become prejudiced. The method of timing adopted by the police in the deliberately-laid traps was most perfunctory. On this latter point probably the police themselves would agree with Mr. Montagu.

The Identification of Motor-Cars.

THE question of the identification of motor-cars is again disturbing the peace of mind of many folks whom we thought had other duties in hand. Thus, following the lead of the Boston Chamber of Commerce, the similar organisation at Lincoln has adopted a resolution suggesting that motor-cars should be numbered with figures not less than three inches high and two inches wide, with distinctive lettering for each county. This idea is one which opens up great possibilities of complication, a fact which the wisacres of both Boston and Lincoln overlooked when drawing up the resolution. Seeing that England has forty counties and Wales another dozen, we now want someone to come forward with specific suggestions as to the distinctive marking for each county. As Surrey has taken so much interest in the matter, we await proposals from someone in that area.

District Registration.

MR MARSHALL HILL has also views on this subject, and proposes that great Britain should be divided into twenty-five districts, each represented by a letter of the alphabet—the letter I being ignored from the calculation. Then the largest police centre in each of these districts should be the automobile registration centre for that area. It should be made compulsory for every car to carry on the rear a number together with the letter of the district in which it is registered. Whilst the Lincolnshire folks would be satisfied with figuring three inches high, Mr. Marshall Hall suggests nine inches as the minimum that would

meet his desire. He thinks that in this way the difficulties of motor-cars travelling outside small registration districts would be met, and identification would be easy and certain. It certainly opens up a new idea of education for the rural policeman, who, in addition to being armed with stop watches, opera glasses and other modern instruments of their craft, will have to carry with them directories of the registration districts and probably other volumes to explain the complications of the same.

A Royal Motor Company.

AMONG the members of Lord and Lady Warwick's week-end house party at Warwick Castle have been Lord Cairns, the Hon. J. Scott-Montagu, M.P., and Mr. G. Cornwallis-West, who took their motor-cars to Broughton Castle on Saturday, to take the Duke and Duchess of Connaught to Warwick. From Broughton six motor-cars set forth, but owing to the rain two turned back to Banbury. The Royal party arrived at Warwick in a very wet condition, but, despite that, the trip by automobile was a decided success, and should do something to bring the Duke of Connaught within the pale of Royal automobilists ere long. On Sunday the King took a motor-car trip, thus emphasising the favour with which he regards the automobile.

Trials Abandoned.

OWING to the refusal of the authorities of Richmond Park to allow trials of motor-cars on the test hill there, the hill climbing and consumption trials of the Automobile Club, announced to take place to-day (Saturday) have been abandoned. This regrettable step cannot be avoided, and automobilists rightly have cause to complain that the hill, so well fitted to demonstrate the capabilities of motor-cars, should be withheld from their service, especially when the proposed trials are undertaken by a

representative organisation which has hitherto conducted such tests without danger or inconvenience to the public. On Tuesday the Club held its quarterly 100 miles trial, the two cars—a Rochet-Schneider car and the Oldsmobile—starting from the new Club House in Piccadilly.

Leaving Horses Unattended.

THE folly of leaving horses unattended in the public streets receives constant illustration, and was nearly the cause of an accident at Newbury the other day. A team of horses appear to have been left unattended in Northbrook Street. Sir Francis Jeune's motor-car was coming from the railway station, having two ladies as passengers, when the horses started and rushed away in a dangerous style. They were stopped some little distance off, and fortunately no one was hurt. The driver of the car was proceeding slowly and sounding his horn; had an accident occurred, the owner of the horses would have had no one to blame but the silly custom of leaving horses unattended in the public highway. Horses are just as likely to be frightened by unusual objects passing by, and by the noise of peace celebrations, as by the motor-car; hence the necessity for them being properly attended.

The Dust Problem.

DR. GUGLIELMINETTI, of Monte Carlo, has endeavoured to find a remedy for the dust evil which arises from the motor-cars on the Riviera, and he advocates as the result of his labours the tarring of the roads. In California and other American districts water has given place to petroleum as a dust-layer. In Algiers olive oil and naphtha oil have been used since 1896. The American method is to cover the roads with a layer of heavy unrefined petroleum heated to 80° C. An asphalt-like deposit, which is solid and durable and forms but little dust in summer and no mud in winter, is formed. This roadway is greatly appreciated by drivers and a saving of 45 per cent. of watering expenses is effected. Two applications of petroleum a year are sufficient; 5,000 litres of petroleum, which cost 400 francs, are required per kilometre. But in France the cost would be five times as much. Dr. Guglielminetti therefore turned his attention to coal tar, which has been applied to roads in the Haute Garonne and in Ravenna in 1901. In the latter town 246 metres of roadway were treated with excellent results. The authorities at Monte Carlo have been induced to try the tar method on the road leading to the slaughter-house. In spite of the prolonged period of drying the results surpassed all expectations. The surface became so hard and compact that it was difficult to break up. There was no dust, and rain did not penetrate the layer formed by the tar. After forty days' traffic the surface was not damaged, and had resisted the wear and tear of wheeled traffic. The cost was from six to seven centimes per square metre. The municipal authorities and hotel-keepers of Monte Carlo are moving in the matter.

Still They Come.

IN addition to the three new sixpenny weekly motor papers announced last week, we hear of yet another. This, it is said, will be edited by the Earl of Rosslyn, who will doubtless hope to gain the favour of the trade. Certainly the automobile agents and manufacturers need not expect to be ignored by those responsible for the motor papers lately started and about to be commenced.

A French View.

ONE of the French visitors to Bexhill on the occasion of the recent speed trials was M. Paul Meyan, of *La France Automobile*. Commenting on the meeting in the columns of our contemporary, M. Meyan remarks that what struck him most was the sporting spirit which animates the English race. He was greatly impressed with the large amount of

interest shown in the trials, and is certain that on the next occasion speed trials are held at Bexhill a much larger number of French *chauffeurs* will be present.

Edison's New Accumulator.

A GOOD deal has been heard lately of Edison's new accumulator. An electrical "run-about" which was recently tested was equipped with a battery of twenty-one cells. It is stated to have carried two persons, and ran sixty-two miles, climbed several hills, and came back with only 83 per cent. of the original speed lost. Another vehicle ran eighty-five miles on level roads before coming to a stop. In the course of an interview Mr. Edison stated that his accumulator "is composed of tiny bricks specially prepared of nickel and steel, suspended in an alkaline solution. The batteries run a hundred miles without recharging, and then they are quickly charged. The only renewal necessary is the occasional addition of a little water lost through evaporation." Should the statements with regard to the new invention be substantiated it will undoubtedly prove to be an important advance. But undue stress has been laid on the fact that the car travelled between 80 and 100 miles without recharging. This is by no means the novelty which it has been taken to be. A year ago the British Electromobile Company produced a car which ran 94 miles on one charge, and distances up to 120 miles can now be covered. Moreover, the Edison accumulator is claimed to develop 1 h.p. per 53 lbs. of cell, whereas the A B C accumulator shown at the recent Exhibition gives the same result on 44 lbs. of cell.

A Battle of Flowers.

IN connection with the French charity fetes at Earl's Court, an Automobile Battle of Flowers will be held. The vehicles will be divided into six sections, viz., two-seated cars driven by ladies; similar vehicles driven by gentlemen; three or more seated cars driven by ladies and gentlemen respectively; groups of two similar cars decorated in the same style, and groups of four similar cars decorated in the same style. The Committee include Messrs. R. W. Wallace, K.C., Mark Mayhew, Paris Singer, the Hon. C. S. Rolls, the Hon. J. Scott Montagu, M.P., Stanley Spooner, Chas. Cordingley, J. Phillips, J. E. Hutton, P. Richardson, C. Jarrott, and S. F. Edge, with Mr. Edward Kenealy as hon. sec. An invitation has been sent to all the leading automobile firms in the country to take part in the affair, which promises to be one of considerable social importance.

The Manchester Club.

ON Saturday, the Manchester Automobile Club held a run to Nantwich, where the Brine Baths Hotel was made the headquarters for the day. For the convenience of members attending, three alternative routes were suggested, *via* Altrincham, Crewe, and Tarporley respectively. The membership of the Club already exceeds one hundred, and new members are constantly seeking admission. Several attractive runs have been arranged for the season. On June 14th there will be a run to Buxton; on July 12th to the Wirral Peninsula, making Leasowe Castle the headquarters; and on July 26th to the Congleton and Macclesfield District, where the members will be entertained by Mr. Gerald Higginbotham.

Steel Roads.

A COMMITTEE of the Automobile Club of America has been investigating the subject of steel roads, and the Club and several of its members have made liberal subscriptions for the purpose of building a sample section of steel road in the vicinity of New York. The Committee have been in consultation with President Cantor, of the borough of Manhattan, and Chief Engineer H. W. Onley. Speculation is rife as to whether the solution of the "dust problem" may come through "steel roads." There is no doubt that motor-cars, macadam, and high speed form a com-

bination which creates an insufferable amount of dust, and that this evil is one of the most serious drawbacks to the enjoyment of automobile travel. It is just possible that this enterprise of the A.C.A. in connection with steel roads may lead to a demonstration which will alter the complexion of road improvement problems entirely. In this respect the United States may set the pace for the world, by virtue of the very backwardness of its road system.

Roads and Transport in Madagascar.

EVER since the definite conquest of Madagascar by the French in 1895, the great problem to be solved has been the creation of roads to transport men and goods from the coast to the capital, Tananarivo. The newly completed macadamised road, which has in the main followed the old native track, is undoubtedly a remarkable piece of engineering. The gradients nowhere exceed the limits of safe locomotion by carts, carriages, bicycles, or automobiles. The road is just 150 miles long in its circuitous track, though under 100 miles as the crow flies. For some years to come the interior transport of the country will be by the macadamised road mentioned, and the question of what will be the system of vehicular traffic has yet to be solved. Hitherto, goods have been transported on men's shoulders, one man carrying from 60 to 80 lbs. The first tentative departure

rettes, and six or seven large cars, in addition to those used in the mail service. By the courtesy of *La Revue de Madagascar*, we are able to reproduce on other pages of the current issue some interesting pictures of the motor-cars on the Island.

Alcohol Motors.

IF, as has been maintained, the alcohol motor has no future for motor-car work, and is inefficient and far more costly to work than the petrol or oil motor, one would scarcely feel inclined to believe it after looking over what has been accomplished with it in France and in Germany. Indeed, Mr. Frank H. Mason, in an article on heat, light, and power as obtained from alcohol in Germany, in the June number of *Cassier's Magazine*, furnishes excellent illustrations of the fact that the "spirit" motor, as it is called in Germany, is even now being applied to a wide variety of uses, not the least of which is the driving of all kinds of vehicles. Perhaps, therefore, the alcohol engine is not nearly so bad as it has been painted. Then, too, it must be borne in mind that the matter of economical work depends very largely upon the relative prices of oil and alcohol, and the price of the latter, particularly in Germany, has been brought down to a very low figure, so that the increased consumption of alcohol in a spirit engine over the quantity of petroleum essence

THE MEET OF THE MANCHESTER AUTOMOBILE CLUB AT NANTWICH.

[R. Banks.

from the old methods was a convoy of three American waggons, each carrying about 12 cwts. (i.e., about fifteen men's loads), and drawn by four oxen, the journey occupying thirteen days from Mahatsara to Tananarivo, a distance, as already mentioned, of 150 miles. Several small enterprises have followed, such as mule carts, ox carts, and hand trucks, but nothing has yet been established on a large scale.

An Automobile Mail Service.

SINCE the early part of 1900 the enterprising Governor-General of the Island, General Gallieni, has been making extensive experiments with motor-cars in connection with the transport of the mails between the coast and the capital. These trials have been so successful that five vehicles, all Panhards, are now in use, and a further number are to be put to work on the completion of a road to Tamatave. Tananarivo itself is built on a hill. Round the base of the hill a magnificent esplanade, twelve miles in circumference, has been constructed, and this is largely used for carriages, horses, and promenaders. Circulation over intermediate parts of the city must be made in "filanjana," or chairs, the hire of which is regulated by a tariff, as with cabs at home; for, unless one be a trained athlete, walking is painful. At present there are in the city seven motor-cycles, several voitu-

required for the same power may not be worth much consideration. But, whatever the disparity of costs may be, alcohol, as claimed by its advocate, has many inherent virtues to recommend it for power purposes.

THE Automobile Club will have a run to Folkestone on Saturday, the 21st inst. Tea will be taken at the Crown Hotel, Sevenoaks, at 4 o'clock.

A FURTHER meeting in connection with the formation of the Lincolnshire Motor-Cycle Club has been held, at which the rules were adopted, and the question of a badge deferred for a few days.

At the Bath and West and Southern Counties' Agricultural Show held at Plymouth last week, interest was taken in the two Wolseley cars which were on view at the stand of Messrs. Hill and Boll.

SEVEN summonses for furious driving were down to be heard at Uckfield on Thursday last. The alleged offenders were Messrs. A. T. Mulliner, E. Midgeley, G. Kenyon, A. E. Crowder, W. J. Peall, and E. de Wilton.

THE Roads Improvement Association is urging the Commissioner of Police to call the attention of railway companies, carmen, and others to the penalties imposed by Section 78 of the Highways Act, 1835, upon drivers who, by not keeping to the left or near side of the road hinder the free passage of other carriages.

AUTOMOBILE FÊTE AT NAMUR.

By AUTOMAN.

LAST Sunday and Monday the automobile competitions at Namur took place under favourable atmospheric conditions. Namur is a picturesque town on the banks of the river Meuse, the chief feature being the "citadel," which is a fortress situated on a precipitous hill which towers over the town and almost cuts it in two. The two principal events were the hill-climbing trial and the Belgian kilometre record.

From the point of view of the spectator, no hill-climbing competition could be better placed, for the hill in question is a zigzag road, two kilometres and a half in length, and with very stiff gradients, right up the face of the hill, in such a manner that the spectators can watch the progress of the cars up the face of the hill without any difficulty.

THE GOBRON-BRILLIÉ PETROL LORRY.

In addition to speed, great skill is required to safely negotiate the turns, which are the most severe that I have ever experienced. A voiturette and a bicycle came to grief at the first turn, and there were many narrow escapes.

The hill climbing trials commenced at 9 a.m., and there were nineteen competitors, with the following results:—

1. Wilford, on a tricycle, in 2 minutes, 43 $\frac{3}{4}$ seconds, at an average speed of 62 kilometres, or 38 $\frac{1}{2}$ miles per hour.
2. Roland, on a Gobron-Brillié, 3 minutes 15 $\frac{1}{2}$ seconds, at an average speed of 48 kilometres, or 29 $\frac{1}{4}$ miles per hour.
3. Dechamps, on a Dechamps, in 3 minutes 19 $\frac{2}{3}$ seconds, at an average speed of 47 kilometres, or 29 $\frac{1}{4}$ miles per hour.

After the racing cars had completed their trials, M. Roland, of the Gobron-Brillié Company, negotiated the hill successfully in a 20 h.p. petrol lorry with forty passengers. It was really a remarkable sight to see this monster with its living load rolling up the hill with the greatest ease and at a good pace. M. Roland tells me that it is capable of doing twenty kilometres (12.2 miles) per hour on the level, with a load of six tons.

The honours of the day were divided between Gobron-Brillié and Dechamps, the latter winning the 1,000 kilogrammes class, and the former the 650 kilogrammes class.

ACCORDING to a contemporary, a gentleman owning a "sixteen-horse car" is a motorist.

MR. RUDYARD KIPLING and Mr. Beerholm Tree have become members of the Automobile Club. M. Léon Serpollet has also been elected to membership.

MOTOR SERVANTS.

A COMMITTEE of the Automobile Club having considered the question of the training and engagement of motor servants, has now suggested that the Club might purchase a vehicle, and that the keeper of the Club motor store-house should devote his spare time to the training of those who desire to become motor mechanics. It is thought that the training might consist of:—(1) Elementary instruction in the principles of construction of the petrol engine; (2) instruction in tube ignition; (3) instruction in the various forms of electric and magneto ignition; (4) the instructor might disarrange the mechanism of a car in such a manner that it would not work, and then require the servant to put it right. For instance, unknown to the servant, the instructor might place water in the carburettor; might short-circuit the electric system; might insert a cracked ignition plug or a cracked ignition tube; might break an electric contact; might loosen the screw by which the earth-wire is attached to the frame; might block the petrol pipe; might derange the timing gear, etc.

The following recommendations have been made:—That as the nucleus of a school of instruction for motor servants, the training of servants be undertaken at the Club motor house, such training to be confined, in the first instance, to petroleum spirit cars; that the training be confined, in the first instance, to servants selected by members of the Club, and sent by them to the Club for training; and to men who may be selected by the Club at the request of the members for training for them; that if there are sufficient learners, demonstrations in the working of different cars of the various manufacturers and agents be given before them.

M. DÉCHAMPS ASCENDING THE HILL.

In this connection the Committee suggest, as a financial basis, that the life of a car costing, say, £250 be taken at three years = £80 per annum; add for repairs, £50; say, per annum, £150. It is thus estimated that the cost to the Club would be about £3 per week. It is suggested that the Club should charge a member £3 3s. for the training of the servant, the time of training to be limited to three weeks. During the training the man is to be kept and paid (if necessary) by the member, not by the Club. The candidate would not be allowed to touch members' cars, except for washing, etc., under the direction of the Club motor house-keeper.

With regard to the engagement of motor servants through the Club no fee is, at present, to be charged the applicant, but the member of the Club engaging a man on the Club register will be expected to pay a fee of £1 1s. Mr. E. H. Lancaster, who has been motor engineer to Mr. Harmsworth, has been appointed to attend to the cars of members and to train servants.

CAUSES OF FAILURE IN MOTOR-BICYCLES.

NO doubt the chief causes of the failure in motor-bicycles last year, when there were practically but three makes on the market—namely, the Werner, Minerva, and Singer—were due to carburation, as all these motors are fitted with surface carburettors. I will confine my remarks chiefly to the Werner motor-bicycle, 1901 type, with which I have had a good deal of experience. In warm weather there is not much difficulty experienced as regards the carburettor giving off sufficient gas to supply the motor. At all times, however, whether summer or winter, the surface carburettor which is fitted was a source of great trouble, owing to the fact that in riding the machine over very bumpy roads the petrol in the carburettor is thrown about, and thus it gives off more gas than is required, affecting the running of the motor considerably. This difficulty is only overcome

the best results from the engine, a remark which applies to all machines in which the trembler is on the engine. I have had very little trouble with the belt, particularly after the first fortnight's usage. The belt on the front-driving Werner is of V shape, and I recommend that a new belt should be oiled with castor oil, by suspending the belt and letting the oil run down the groove. A belt thus treated certainly grips better, and its life is prolonged to a very large extent.

Another cause of the motor not running well arises from trouble with the inlet valves. There is no doubt that in runs of an hour's duration, or longer, the motor gets extremely hot, causing the inlet valve stem to stick owing to oil or by the by-products of the explosions getting on the stems. There are two ways of getting over this difficulty. One is by taking out the inlet valves and well washing the stems with the finest blacklead and petrol, which on evaporation leaves them well coated with blacklead, which I have found to be the best lubricant where great heat

THE MADAGASCAR AUTOMOBILE MAIL SERVICE—THE FLEET OF CARS AT TANANARIVO.

by controlling the air inlet. What is wanted in cold weather to give satisfactory running with the 1901 Werner is that the carburettor should be warmed with the pipe from the exhaust. This has been done by a number of Werner riders by using a flexible tube from the bottom of the exhaust box to the tank, but it is not altogether an easy matter, as the motor, being on the head stem of the bicycle, moves independently of the carburettor.

Another source of difficulty lies in the fact that the induction coil is situated on the seat pillar stem, and is close to the back wheel, which, in wet weather, throws up a quantity of mud, and very often causes a short circuit which at once stops the motor. This trouble is only overcome by thoroughly drying the wires. The covering of the coil is a matter which should also be attended to by users of the Werner.

Stoppages are also often caused by poor adjustment of the blade. A little time and patience spent on the adjustment of the platinum-tipped screw, where it comes in contact with the trembler, is well spent. The point of the platinum-pointed screw, too, must be kept in first-rate condition by the aid of a very fine file—a watchmaker's file is found the most suitable—in order to get

is generated. In the event of a stoppage on the road caused by the inlet valve sticking, a little petrol squirted by an ordinary bicycle lubricator on to the stem will overcome the difficulty very easily.

With regard to the use of petrol for starting the engine, this I invariably use when first starting out, squirting a little into the combustion-chamber through the compression cock. This enables the motor, in nearly every case, to be started after a few turns of the pedal. Another cause of failure in the old Werner was often due to the fact that the reserve petrol tank was not fitted with a small tap to allow air to get in as the petrol fed into the carburettor. This was a great stumbling-block to many riders of the machine, for, as the petrol fed into the carburettor, a vacuum was set up, which eventually stopped all further flow.

T. UNDERWOOD.

MESSRS. HOYLE BROTHERS AND Co., LIMITED, of Brighthouse, have taken up the construction of motor-cars, to which they have given the name "New Century."

FROM LAND'S END TO LONDON.

BY MRS. HENRY EDMUNDS.

AS many readers have shown interest in my husband's account of "Antrona's" run to Cornwall, perhaps they may care to read the story of the return journey, written from a lady passenger's point of view. Falmouth is situated in a very hilly district, and after "Antrona's" arrival the rain fell every day, so that we had little opportunity of going about; but on Sunday "Antrona" took us to church, much to the surprise of some of the residents, who were not in the habit of seeing that sort of vehicle in front of the church door.

The morning of the last day of March promised to be fine, so our party of five (including a guest from London, who had never before ridden in a motor-car), started for the Lizard, the car climbing the steep hills which surround Falmouth, up among the granite quarries, the views of coast scenery seen from the hill tops being very fine. Soon we turned inland and went along a narrow road over rugged granite hills until we suddenly came to a halt, for, blocking the way, was a huge load of granite on a heavy trolley, the axle of which had broken. Every attempt to pass proved futile and we turned homeward and gave up all hope of seeing the Lizard that day. The weather had broken and a fine rain was falling, so we were somewhat resigned to the disappointment, especially when we heard later that the weather had been very wet at the Lizard.

However, it does not always rain, even in Cornwall; a change came, the sun appeared, and "Antrona" left the Falmouth Hotel on the morning of April 2nd for a journey to Land's End and the Lizard. We passed through Falmouth's tortuous streets up over a most trying hill, on to Penryn to the bridge, where we were stopped by a man who said that the bridge was closed for repairs. The climb up the long narrow main street of Penryn was one to be avoided, if possible, so much argument was used to induce the keeper to open the gate; he finally yielded, and the car passed over the gap left by a broken plank and went slowly on through the village.

The day was to prove eventful; soon one of the little things which happen to motor-cars afflicted "Antrona," and diagnosis took time, during which her passengers enjoyed the beauty of the surrounding country and studied character by watching the village children who gathered to look at the car, which was a novelty to them. Again and again "Antrona" started and stopped until a drop of oil found the required spot, and then we went steadily on to Redruth, passing a number of old mining shafts. It was sad to see only the debris of a past industry, and we hoped that in the near future means might be found for profitably working the mines and so bringing the tin from the deeper veins, which still lie untouched, to the surface.

At Redruth a number of people seemed to take an unexpected interest in "Antrona's" approach. The landlord of the hotel appeared, conducted us indoors and explained that there had been a rumour that the King was coming on his motor-car. After doing justice to a good lunch we started to continue our journey, and found, to our surprise, that the streets were lined with expectant crowds, loyally displaying patriotic bunting, and eager to show their devotion to their King. Would that it might have been more suitably rewarded. The crowd continued to line both sides of the streets for a couple of miles, until Camborne was passed. Many took off their hats to the man at the wheel; but, alas! the people were looking for their King and not a fellow-subject.

We went on through Hayle, and stopped at a railway station, where two of the party left us to travel by the prosaic railway to Newquay; we then continued our journey to Penzance, arriving at the Queen's Hotel a little before six o'clock. Information about the locality, and particularly about the state of the roads, was gleaned from fellow visitors, one of whom, an artist, joined us on Thursday morning for a run to Land's End. This was one of those perfect days which only occasionally fall to the lot of humanity, and which will always remain a living memory. "Antrona" carried us over the hills on towards Land's End. The

limit of road travel was reached and a most glorious view lay spread out before us. The brilliant colouring was marvellous; the rocky headlands jutted out into a sea where emerald, turquoise, and sapphire tints blended each into the other, with a purple glow in the distance which defies description. The spring sunshine glinted back from every wavelet, and the blue sky was flecked with snowy clouds.

The return journey to Penzance was made by St. Just, over very good roads, and our guest was greatly impressed by "Antrona's" power, especially by the fact that it was not necessary to walk up the hills. Penzance was reached in time for lunch, where the photograph shown was taken, and a start made for the Lizard. The sun shone brightly as we passed St. Michael's Mount, the picturesque seat of Lord St. Levan, recently visited by the King. The horses in this part of the world are unaccustomed to motor-cars, and their drivers more so; one group of vehicles made a most ludicrous picture. The first, a carriage drawn by two horses, stopped, and frantic gestures blocked "Antrona's" approach until the occupants alighted and sought refuge in a neighbouring field; the horses looked mildly at us as we passed on toward a heavy cart drawn by three horses tandem,

MR. EDMUNDS AND PARTY AT PENZANCE.

whose driver pulled off his coat and standing on tip toes tried to hold it over the eyes of the leader, to shut out the awful sight of "Antrona's" approach. A third team nearly blocked the way; but soon all were passed. Not one of the horses in this group was restive, it was the people in charge of them who showed most unreasoning fright. Many times one of our party went and helped frightened drivers and led the horses past the car. In each case the horses showed that they did not fear the motor when they were properly handled. After a delightful run of an hour and a-half the Housel Hotel at the Lizard was reached in time for dinner. The sunset threw vivid lights on the wonderful view; and the brilliant colouring nearly equalled that seen at Land's End earlier in the day. It is almost unprecedented to visit Land's End and the Lizard in one day and only possible by motor-car. The distance travelled was fifty-three miles over very hilly country. We started at 10 a.m. and completed our journey before 6 p.m.

The start for London and home was made on Friday. We left the Housel Hotel at 10.15 a.m., went steadily on, overtaking a carriage which had started some time before to carry passengers to Helston, the nearest railway station, eleven miles from the

Lizard. We soon passed Helston. The moorland, with its golden gorse, faded away in the distance; and the rich agricultural country came into view. Falmouth lay some distance to our right. The landscape was very undulating here, and beautifully diversified; primroses crowded together on the hillsides and a few trees were putting forth their first leaves. We occasionally passed stone crosses carved with interlacing osier patterns, and interesting in recalling the early days of Christianity, before there were large churches in Cornwall, and when open air services were the rule. The cross then marked the place where the congregation gathered. "Antrona" went rapidly on until Truro was reached and a halt made at The Red Lion Hotel, and at 1.30 we restarted towards Ladock, passed through it, and went on over a very good road to St. Columb, a long straggling town with quaint old houses. As we went down the hill toward the Market Place two ladies, in frantic terror at our approach, dragged their pony out of the way; a man came out to help them, and each pulled the poor animal in a different direction. I wonder he survived such treatment.

Another steep climb awaited us, followed by a descent to Wadebridge. Then we went up and up to Camelford; rain had

delighted with the sensation; a dozen children packed in at once made a charming picture.

We left Yeolmbridge on Monday morning at 9.45; went through Launceston, and soon were up on Dartmoor, with the golden gorse about us as far as the eye could see. The east wind blew in our faces, but we were thoroughly warm in our nest of rugs; and even the invalid of the party felt refreshed and invigorated by this method of open air treatment. A halt of a few minutes was made at Okehampton, where our driver refreshed the inner man, and then went on to Exeter, arriving there at 1.45 p.m. The road surface was much better than on the journey down, as the new "metal" had been rolled, and only a few patches of rough stones were encountered. At Exeter we stopped for lunch at the Royal Clarence Hotel, and afterwards visited the Cathedral, and much admired the beautiful vista of the nave, with its fine Gothic pillars. Time pressed, however, "Antrona's" store of petrol was replenished, and we left the hotel at 3.30. A few horses objected to our approach, and we had one narrow escape from a serious accident. A pony and trap backed into a young horse (drawing an American trotting car), which was also much frightened at our approach, and turned

THE DE DIETRICH AT AUTUN (SAONE ET LOIRE).

THE PARIS-NICE HEAVY CAR TRIAL.

begun to fall and the steep descent through the town was made more difficult by the wet. Suddenly "Antrona" side slipped and turned almost against one of the houses, quivered, then righted herself, and, guided by careful hands, crept inch by inch down the steep hillside and out into open country; another climb to about 1,000 feet above sea level, and then on to Davidstow, and again out on to the open moorland. Some horses were grazing here by the road side, and they took the road directly in front of us, and trooped along ahead. The rain fell heavily, so the hood was put up, which thoroughly sheltered those of us who occupied the back seat. The man at the wheel had a hard task in guiding "Antrona" down the long steep hill, as the surface was very slippery, and the last two hours' journey proved the most difficult and trying of the run both to the car and to the driver. We passed through Launceston, riding slowly down the steep St. Thomas's hill, and then across the line into Devonshire to Yeolmbridge, where our day's journey ended and friendly voices welcomed us with true West Country hospitality. The day's journey was a record one—from one end of the county to the other. Ten gallons of petrol were consumed from Penzance to Launceston, including the journey to The Lizard. The steepest gradient encountered was one in eight, and the greatest height reached 1,000 feet. The village people took a great interest in the motor-car, and many of them were taken short rides on it, and were

so sharply at right angles as to nearly overthrow the carriage, in which two people were sitting. "Antrona" stopped, and our man was soon at the horse's head, and led him safely past.

The direction posts indicated that we were on a wrong road; so we made many enquiries as to the way to Honiton, and there was much difficulty in finding any one who could direct us. At length a cross road was pointed out, which led us directly to the main road, and after that we went on over the steep Straightway Hill to Honiton. We stopped for tea at the hotel, then went on through the broad main street and found that a long climb awaited us, succeeded by a curving descent that seemed interminable. We wound through the picturesque village of Yarcombe and crept slowly down the hill, when smoke began to issue from the band brake, which had been overworked; so we stopped for several minutes to let it cool, and enjoyed the view of the surrounding country. On arriving at Chard we were welcomed by our friend the Mayor, who met us in the street waving the telegram we had sent to tell of our coming. He had only just arrived from London, so we met most opportunely. We reached the George Hotel at 6.30, where we were very comfortable. The following morning our friends took a run on "Antrona" to Ilminster, while some of us explored Chard and learned many interesting things about the place. It is the highest town between the two Channels, and a stream

of water flows each side of the main street; one of these reaches the Bristol and one the English Channel.

We started at 3.30, carrying pleasant memories of our visit to Chard. Crewkerne, Yeovil and Sherbourne were passed in quick succession, but night approached; so we decided to remain in Shaftesbury instead of pushing on to Salisbury. The road to Shaftesbury is broad, with good surface, and winds up the hill with an easy gradient; Shaftesbury is a "city set on a hill" more than 700 feet above the sea level. Three counties meet in the park, which commands an exceedingly beautiful view. We spent the night at the Grosvenor Hotel, where we were very comfortable and slept as only motorists can sleep after a day's touring in the keen April air. Our time in Shaftesbury was short; but we made a mental note to go there again at the earliest opportunity. There is much of interest in the neighbourhood and it is a delightful place in which to stay. Wednesday morning saw us start early, soon after nine, as we wished to reach home that day, and we went through most beautiful country for ten miles or so, when our batteries gave out, and refused to do any more work, although some time was spent trying to persuade them to do so. Presently the burners were lighted, and we continued our journey with tube ignition. At Salisbury we enquired the way through the town of a clergyman, who most kindly mounted his bicycle and acted as our pilot, thereby saving much trouble and delay; he led us through one street after another and around corners quite unknown to us and left us in the main road for Andover, which led over the bleak Salisbury Plain, where the east wind blew with unabated vigour. We managed to keep warm, however, and we arrived at Andover at 1.15 p.m. The stock of petrol was replenished here, and we left, after lunch, at 2.30. The burners had given some trouble, and finally brought us to a stop a little while after leaving Whitechurch, in a small village where most of the male population gathered to look at "Antrona." An old man, evidently bewildered at such an innovation, walked away, shaking his head and saying, "I be feared to look at un." However, he came back and looked until we again moved on, only to stop a little further up the hill. Then our last trump card was played, a spare battery was connected up, and the effect on "Antrona" was magical; she went on in splendid form and soon made up for lost time. Basingstoke soon lay behind us, and on we went through beautiful country, which we admired greatly, and we found that, even after seeing the rocky headlands and steep hills of Cornwall, and the wild moorland and charming valleys of Devon and Somerset, the softer loveliness of the home counties appealed to us more than ever. We passed Bagshot, and on to Egham "Antrona" quickened her pace. We looked into Windsor's great forest, then Staines and Kingston were passed and home reached at 7.45 p.m.

"Antrona's" journey to Cornwall and back is a thing of the past; but she deserves a word of commendation for so bravely doing her part. All her mechanism did very good work under most trying circumstances. Steep gradients, rough surfaces (sometimes wet and slippery) all combined to make the journey a difficult one. The Collier tyres were a great comfort, as they gave no trouble and brought us to our journey's end without giving any anxiety. May I also add a word in praise of motoring as a health restorative, for I had been weakened by months of painful illness and was unable to walk, or endure much fatigue, before this tour, and the hundreds of miles of travel in the open air have been of great service in restoring my health? I therefore recommend motoring as the finest tonic possible.

In consequence of the rapid development of their business, Messrs. Panhard and Levassor have acquired more extensive premises, situated in Kimberley Road, Willesden Lane, Edgware Road, N.W. The new works have been built to enable all repair work to be executed with accuracy and despatch. A large stock of spare parts and accessories for Panhard cars of all types is kept on hand.

THE MASSIGNON VARIABLE-SPEED GEAR.

A NEW variable-speed gear has recently been introduced by M. Maurice Massignon, of St. Mandé, France, by means of which any desired forward speed and a reverse motion can, it is claimed, be obtained. Referring to the accompanying illustration, for which we are indebted to *La Locomotion Automobile*, *B* is the motor-shaft, *T* is a conical pulley, and *P* an ordinary pulley fixed to this shaft. Power is transmitted from the pulleys, *T* and *P*, to the counter-shaft, *D*, by means of the belts, *H* and *K*, the cone pulley, *T'*, keyed on the hollow shaft, *BA*, the plain pulley, *P'*, on the hollow shaft *DM*; and the epicycloidal gearing, *G*. The latter consists of an internally-toothed wheel, *M*, keyed on the end of the hollow

shaft, *DM*, and rotating at the same speed as the motor, through the intermediary of the pulleys, *P* and *P'*, and the belt *K*, 2, a disc, *A*, keyed at the end of the shaft, *DA*, rotating at variable speeds by means of the cone pulleys, *T* and *T'*, and the belt, *H*. The disc, *A*, carries a number of double planet wheels, *c*, meshing with the pinion, *C*, on the shaft, *D*, and the pinions, *m*, meshing with the internally-toothed wheel, *M*. The action of this device will readily be seen from the illustration. The striking forks, *F* and *F'*, permit the position of the belt, *H*, to be varied upon the cones, *T* and *T'*, and hence cause the relative speed of the second member of the epicycloidal gear to be varied within certain limits. By regulating the position of this belt, the speed and the direction of rotation of the shaft, *D*, can be varied at will.

THE exports of motor cars and parts from the United States during the month of March amounted to £17,670.

CONTINENTAL NOTES.

BY "AUTOMAN."

WITH the return of the hot weather the dust question comes up again. There are two evil spirits hovering over automobilism and endeavouring to dull the keen edge of the motorist's pleasure, and each one representative of a season. The side-slip fiend, now that the winter is gone by, is forgotten, save for an occasional reappearance after a shower; the dust fiend, however, takes its place, and inventors set their brains again to work to find a means of "laying the dust." This dust question has been particularly baneful on the Riviera, where the favourite Corniche drive between Nice and Monte Carlo has become almost impossible to the pleasure seeker on account of the clouds of dust occasioned by the automobilists.

In connection with the recent alcohol fuel consumption trials in France, a special fitting was designed for the fuel tanks, with which all vehicles competing had to be provided. The rules of the contest referring to this part were as follows:—The tank must be fitted with two openings for filling, each 6 centimetres (2.4 in.) in diameter. The plug of these openings must conform to the design shown herewith. The openings must be

located in the upper part of the reservoir and at opposite sides to facilitate the filling and the escape of air. The openings must be readily accessible to permit a rapid filling and measurements of the liquid remaining in the tank. The tanks must not have any plunger tubes nor separating walls on the inside. The walls of the tank must be perfectly rigid and incapable of bulging. The contestants are required to so locate their fuel tank that it can be inspected by the commissioners from all sides. Simple piping must be employed to connect it to the carburettor; the fuel admission opening will be stamped. The contestants must state the exact capacity of their tanks, in litres. Every vehicle will be equipped with a rule, with a scale indicating the quantity in litres of fuel in the tank by being immersed in it vertically.

THE Paris-Vienna motor-car race is authorised now officially by the French Government. The date has been fixed for June 26th, 27th, and 28th—that is to say, coincident with the Coronation. It is a pity that this date should have been selected, for it will prevent many people who take great interest in it from participating as competitors or spectators, and the interest in it in England will be swamped by the excitement of the Coronation *fetes*. It is unlikely that the Swiss authorities will be persuaded to allow any racing on their territory, but there is no knowing. Ideas are undergoing a rapid change on the subject of automobiles, and the reign of common-sense will no doubt reach the Alps in due course.

Two new bye-laws have been added to the racing rules by the *Commission Sportive* of the A.C.F. In the first place, "rescue cars" along the line of route are forbidden, and any firm employing them will be subject to disqualification, which will apply to all the cars of its manufacture. It was fast becoming the custom in road racing to send a car after the racers, carrying spare parts, so that in case of an accident to a small part it could be replaced on the road, and the race continued. These "rescue cars," not being in the race, were in the habit of rushing at full speed through the controls, and of passing and repassing the racers, and the suppression of this nuisance is a move in the right direction. The second innovation is the veto which is put on all racing trials over the course before the race, and any racing car seen exceeding the regulation speed will subject the driver and the maker to disqualification without the return of the entrance fee. The bye-law is the direct result of what occurred on the Nice-Abbazia road just prior to the date fixed for the race. There is but little doubt that the authorisation was withdrawn on account of representations made by influential persons along the route, owing to racing cars having tested their speed in an inconsiderate manner on the roads, scattering havoc amongst the domestic animals and frightening the peasants. To prevent the repetition of these difficulties the A.C.F. have taken a wise decision, and mean to enforce it sternly. Those who want to study the route had better take a slow car and run it steadily, as correspondents along the route are on the look-out for offenders.

THERE are altogether 145 entries for the Paris-Vienna race up to the time of writing, and the lists remain open until June 15th. It is therefore likely that nearly 200 entries will be received. There will, of course, be many cars scratched, but a field of from 80 to 120 will probably remain and come up to the starting post. It will therefore take from two and a half hours to four hours to get them all off, at the very least computation. The conditions this year, it must be remembered, are much more severe than last year, and it may be safely predicted that a large proportion of the starters will not get through at all. I shall be surprised if one-half reach Vienna. All the repairing has now to be done on the road, and the simple fact of having run through from Paris to Vienna in the stipulated time will be a recommendation for any make of car.

THE French papers are having a good laugh about Edison's new battery applied to motor-cars. The battery may be a wonderful and useful invention, and a great improvement on anything that exists, but this needs yet to be proved, and Mr. Edison, before startling the world with an automobile drive of 100 miles on one charge, would have done better in first getting to know what other people have already done. Both Krieger and Garcin covered 125 miles on one charge more than a year ago.

THE Alcohol Exhibition in the *Gallerie des Machines* continued to be a great attraction to automobilists all last week. On Friday morning M. Loubet, the President of the Republic, paid a long visit to the show, and went round to all the stands, accompanied by the Minister of Agriculture, M. Jean Dupuy. The President takes a great interest in the motor-car movement, and he complimented the successful competitors in the various trials.

WHEEL STEERING DEVICES.

WHEEL steering devices belong to two general groups, viz., (1) those that are reversible, and (2) those that are irreversible. Both types have their advocates, because both have good as well as bad features. Inquiries are frequently made in regard to wheel-steering devices, and I feel warranted, writes Mr. H. D. Meier in *The Horseless Age*, in stating that the majority of automobile builders who construct carriages exceeding in weight 1,200 pounds have either adopted wheel-steering or seriously contemplate doing so.

What is in demand is a device with as little back-lash as possible. There is practically no lost motion in any wheel-steering device so long as it is new—provided that the workmanship is good and the design of a mechanical nature; but it is not long before the link actuating parts begin to show wear. Of reversible transmission devices commonly used in steering-gears we have the rack and pinion (the former part being connected by a link to the steering knuckle arm) and the gear and sector. The two are mechanical equivalents and are deservedly popular, because, if properly proportioned, they cannot wear excessively, and any

and pinion, because any reduction can be had with a given size pinion, and the latter and the gear sector can readily be inclosed in a dustproof case and made to operate in a bath of oil. This would seem to leave but two systems out of four that are of real all-round practical use and applicable to any type of vehicle.

THE St. Nicholas Skating Rink in New York is to be converted into an automobile garage.

THE first draft of a standard form of guarantee has been prepared by the executive committee of the American National Association of Automobile Manufacturers.

SIR JAMES MILLAR, Bart., has just purchased a 16-h.p. Panhard from the British Automobile Commercial Syndicate. It is fitted with a Roi-de-Belge body, built by Messrs. J. Rothschild and Son.

ONLY motor-vehicles propelled by electricity or by steam generated by the use of coke are allowed on the dock premises of the London and India Docks Company.

IT is rumoured that a policeman is being placed behind a hedge on Broadwater Common, near Worthing, on Sunday to watch for motorists exceeding the legal limit.

CONVEYING ONE OF THE CARS ACROSS THE FERRY AT MOUGORO, MADAGASCAR.

sudden blow to one of the steering-wheels will not strain the running gear much, because of this feature of reversibility. However, all shocks are transmitted to the steering hand-wheel, and as a result the driver's hands soon tire. The effect on the nervous system is not at all pleasant, and many a motorist driving on rough roads may have been induced to shorten his day's run on this account.

Irreversible devices in general use consist either of a worm and worm wheel sector or a square-threaded shank working in a sleeve or nut, which in turn engages a bell crank that operates the main link of the steering device. French vehicles, with few exceptions, are equipped with the worm and worm wheel sector type of steering device, which is quite satisfactory for a short time. In use the thread and tooth surfaces of the worm and worm wheel respectively soon begin to show appreciable wear and back-lash, which steadily increase with use. The great amount of lost motion makes this device less positive and rather slow acting. The "square-threaded shank and sleeve"—the latter is virtually a nut—is an ideal device compared to the one just described, as the possibility of wear is slight if a fair-sized thread is used and the sleeve is made long enough. This type of mechanism is used on the Rochet-Schneider vehicles built in France and others. Of all the devices described the worm and worm wheel sector type is certainly the least satisfactory. The pinion and bevel gear sector system is better than the rack

THE MADAGASCAR AUTOMOBILE MAIL SERVICE—ON THE ROAD TO MANDRAKA.

NEW members of the Automobile Club include Lord Hastings, Sir Alfred Cooper, Sir J. W. Malcolm, Bart., Sir E. Malet, K.C.B., Sir Coleridge Kennard, Bart., Sir Lindsay Wood, Bart., Mr. W. E. Harrison, J.P., Mr. W. Arkwright, J.P., Mr. W. Rees Jeffrey, Mr. G. S. Bayley, J.P., and Mr. Herbert Ingram.

A COMPANY has been formed, under the style of Stringer and Co., to run motor-cars from Rotherham, near Sheffield, to Parkgate. The vehicles will be supplied by the Motor Manufacturing Co., and, according to a local newspaper, "will be worked by petroleum, as a result of which there is no risk of explosion."

THE Scottish Road Book for 1902 has been issued by Henry S. Nisbet and Company, Limited, of Glasgow, in an easy and concise form. More than a hundred and thirty road routes are given; there is a comprehensive list of hotels, a lamp-lighting table, and other information of interest to those who go by road—whether by cycle or by car.

THE Orient is the name of a new American bicycle which has been put on the English market by the Remington Automobile and Motor Agency. The motor, which is a 2-h.p. Aster, is located inside the frame, and drives the rear wheel by a belt which is provided with a jockey pulley. The machine has a long wheel base, and is claimed to be able to attain speeds up to forty-five miles an hour.

THE WHY AND WHEREFORE OF THE DIFFERENTIAL GEAR.

IN order to secure sufficient adhesion of the driving wheels to the ground (*i.e.*, to prevent slipping of the wheels) and to secure a balanced-driving effect, at least two of the wheels of a four-wheeled vehicle must have power transmitted to them, and these two wheels must be on opposite sides of the vehicle—that is, both either on the front or on the rear axle. With very few exceptions the driving wheels are placed on the rear axle.

FIG. 1.—A SPUR DIFFERENTIAL GEAR.

On reflection it will easily be seen that when a vehicle describes a curve all the wheels turn at different speeds, since the radius of the curve described is different for each wheel. It is, moreover, self-evident that the inner wheel turns slower than the outer one in describing a curve. The arrangement of the driving mechanism must, therefore, be such as to allow of this unequal motion of the two wheels on curves, while at the same time it must impress a substantially equal turning effort on the wheels under all conditions.

Where two independent motors are used for propulsion, each being geared to one of the driving wheels, these conditions are satisfied, since all the motors used for motor-car propulsion have the characteristic that their running speed automatically decreases when the resistance against which they operate increases, as it does in the case of the inner wheel when a vehicle describes a curve. Many electric vehicles use two independent motors for driving, but in steam and petrol vehicles double motors are practically never used.

To satisfy the above-mentioned requirement, *viz.*, to allow the two driving wheels to turn at unequal speeds and to always impress equal turning efforts on the two—with a single motor, a differential gear is employed, also called a balance gear, a jack in the box, a compensating gear or an equalising gear. Two general forms of differential gears are at present in common use—bevel differential gears and spur differential gears.

This leads us into the subject of gearing, and it may be well to define here some of the most frequently employed terms used in connection with gearing. Gears are nearly always used in pairs of different diameters, the smaller one being called the pinion and the larger one the wheel. A spur gear is a gear with straight teeth on a cylindrical surface, the two axes of a pair of spur gears in mesh (*i.e.*, in operative relation) being parallel. A bevel gear is a gear with straight faced teeth on a conical surface, the two axes of a pair of bevel gears in mesh being always at an angle to each other and intersecting. Helical gears (also called spiral gears) are gears with teeth of a helical curvature on a cylindrical surface. A pair of helical gears with parallel axes are called screw gears. A part of a gear wheel is called a gear sector. A rack is a straight bar with gear teeth cut on it. A spur wheel with the teeth on an internal cylindrical surface is called an internal gear. The pitch of a gear relates to the size of the teeth. Gear wheels of the same kind, with teeth of the

same pitch, will mesh properly and operate together, no matter what be the relative number of teeth of the two.

Every differential gear comprises a wheel or casing, by means of which the power is applied to it, and two gear wheels, by which the power is transmitted to the two driving wheels. While in the simplest form of differential gear these two are all the gears required, the two most common forms, above referred to, employ in addition a number of pinions which have a bearing support in the wheel or casing, and which transmit the turning effort from the said casing and divide it equally between the two gear wheels connected with the driving wheels. In a bevel differential gear the pinion and the wheels are, of course, both bevel gears.

In Fig. 2 is shown a typical design of bevel differential gear. In this case the driving axle is not divided, but extends entirely through, from outside to outside of hub. One of the driving wheels is fastened to the axle *A'* and the other to the sleeve *A*, which is slipped over the axle. The two bevel wheels *W W'* of the differential are shown as keyed to the axle and sleeve by keys *K' K* respectively. These two bevel wheels *W W'* are connected by three bevel pinions *P P P* rotatable on studs, which are held in the two-part casing *C G'* and in the spider *B*, which latter has a bearing on the axle between the two bevel gears. To the casing is fastened a sprocket wheel, bevel gear or spur gear, for driving, as indicated in dotted lines in the figure. It is easily seen that when the casing of the differential rotates around the axle centre and the pinions *P P P* do not rotate around their studs, the bevel wheels *W W'*, and consequently the driving wheels, turn around their axes at the same speed. When the pinions rotate around the studs at the same time that the casing is rotated around the axle centre, the two driving wheels will rotate at different speeds. The pinions form double armed levers with equal arms. The power is applied at the fulcrum (the stud), and the forces or pressures on the opposite tooth contacts are equal. As the distance of the tooth contacts on the two bevel wheels from the centre of the axle and sleeve is the same, the turning efforts or torques impressed on the axle and sleeve are equal, which is the second of the requirements to be satisfied.

Fig. 1 illustrates a spur gear differential. In this drawing a divided axle is shown. To the inner ends of two half axes *A A'* are fastened the spur wheels *W W'*. These are surrounded

FIG. 2.—A BEVEL DIFFERENTIAL GEAR.

by the two-part casing *C G'*. Through the walls of the casing pass studs *B B B B* parallel with the axle, and on these studs are mounted, so as to rotate freely, spur pinions *P P P P*. It will be noticed that the spur wheels *W W'* are a certain distance apart, also that the pinions are about twice as wide as the wheels. Each pair of pinions is so arranged that each single pinion is in mesh with the other, with one-half the length of its teeth, and with one of the wheels *W* with the other half length of its teeth. It will now easily be seen that when the case is rotated around the axle centre and the pinions do not turn on their studs, the two spur gears *W W'* turn at equal speeds. When the pinions

rotate around their studs while the case moves around the axle centre of one of the wheels W W turns faster than the other one.

The number of bevel pinions or of pairs of spur pinions varies. Two is the smallest number that should ever be used, and sometimes as many as five are employed. The spur gear differential has the advantages over the bevel gear differential that it is cheaper to manufacture and avoids all end thrust on the gears and pinions. The former is a little less compact than the other. The differential gear may be placed on the rear axle, on a countershaft or on the motor shaft. When it is not on the rear axle two chains or other transmission devices are required to transmit the power to the driving wheels. The practice of placing the gear on the rear axle is gaining in favour, and is, according to the *Horseless Age*, almost universal in the United States.

HERE AND THERE.

THERE is no vacation in the school of automobile experience.

GOOD workmanship in a motor-car, like phosphorus, shows up best at the darkest hour.

LORD SHAFTESBURY is about to become a motorist—another proof of the interest of the aristocracy in automobilism.

THE Police Department of Atlantic City, N.J., have placed an order for an electrical patrol wagon.

MR. WM. STARLEY, of Coventry, has issued a little book giving an account of the life and inventions of James Starley, "the father of the cycle industry."

THE British Automobile Commercial Syndicate are now appointing agents for the Clement cars, and the Bristol Motor Company has secured the agency for their district.

MR. M. GRAHAME WHITE has apologised to the Automobile Club for having driven in a manner calculated to injure the interests of automobilism at the Dashwood climb on the 10th ult.

IT is reported that one of the chief French firms of motor-car builders has purchased a stretch of ground outside Paris for the purpose of making a track on which automobile racing can be carried on.

LORD DUDLEY and Lord Hardwicke have been at Braemar for a week's salmon fishing in the Dee. They made the journey between Aberdeen and Braemar (about seventy miles) on a motor-car.

THE new public motor-car service in Porto Rico appears to be in successful operation. Three cars have been placed in service between San Juan and Ponce by the Automobile Transportation Company of Porto Rico. The cars used are of the petrol type.

ACCORDING to the *Leeds Mercury*, the county magistrates, who to-day are trying to put down the motor-car, are the descendants of the stupid people who, in their day of power, would not have a railway within ten miles of their estates. Their heirs and successors do not speak respectfully of their wisdom.

THE Wilkinson Tyre and Tread Company, Limited, has been registered, with a capital of £5,000 in £1 shares, to acquire the business carried on by Mr. C. H. Wilkinson, at Princess Street, Huddersfield, as the Wilkinson Tyre Manufacturing Company, and to manufacture and deal in tyres for motor-cars, etc.

A LADY, who carries on the business of a fruiterer at Bray, brought an action against Messrs. Guinness, Son, and Co., for damage to some grapes, etc., spoiled by the smoke from the defendants' motor-cars. The Recorder of Dublin characterised the action as a frivolous one, and it was dismissed.

MR. E. G. WADDILOVE, of Lincoln's Inn, W.C., complains that it has become the practice for motor-car drivers to race down the Portsmouth Road at Roehampton to Kingston Vale, where there is a straight piece of road with a fall of a hundred and ten feet in three-quarters of a mile.

MOTORISTS are warned not to go along the Hemley Road, Gornal Wood, Sedgeley, where mining operations have caused serious subsidences.

MOTORISTS in the Hampton Court district will find the motor and cycle works of Mr. Rowland Williams, in Walton Road, East Molesey, well adapted for repairs of all kinds.

MR. A. E. CORFIELD, of Cardiff, has sent us a sketch of a new pneumatic tyre he has designed with the view of overcoming the puncture demon. He is having a set made, and intends to experimentally fit them to a M.M.C. car.

ON Friday last the motor fire engine built by Mr. T. C. Crowden for the Norwich Fire Insurance Company was put to a severe test at Worcester, being under steam from 1 p.m. to 1 a.m., and undergoing its trials without a hitch.

THE accompanying illustration shows Mr. Edward F. Croker, the chief of the New York Fire Department, on his latest steam car. Mr. Croker has used a Locomobile for the past three years, and in

THE CHIEF OF THE NEW YORK FIRE DEPARTMENT ON HIS LOCOMOBILE.

the new car has had a number of special features incorporated, as a result of his experience. The car, which is of strong and heavy construction, with an extra wide seat, attained a speed on its trial trip of thirty miles an hour.

A MOTOR-CAR on the premises of the Long Acre Motor-Car Company, in Long Acre, W.C., caught fire on Monday, and was pushed out into the street, where it was attended to by members of the London Fire Brigade who arrived at the scene.

WE learn from Mr. G. Calvert, of Mildmay Park, N., that in future he will make his "Seer" plugs with platinum wire only, as he has found those with the metal ones to be unreliable, owing to the unequal expansion of iron and glass—an inequality which does not exist with platinum and glass.

THE Automobile Club of America has established a country club-room in the Garden City Hotel on Long Island, which will probably be visited frequently by the members of the Club during the summer months. The Club members will have all the privileges of the hotel, including swimming and shower baths, billiard room and charging and storing facilities, besides the exclusive use of their special room.

A MOTOR gymkhana will take place at Ranelagh on the 14th inst.

MANY of the larger hotels in Switzerland are replacing horse-drawn omnibuses by electric vehicles.

A 12-H.P. Progress car has arrived at Llanfair (Montgomeryshire) to the order of Messrs. John Brothers.

ACCORDING to the *Motor World*, liquid air has been conclusively proven to be first cousin to liquid moonshine.

MR. AND MRS. MARK MAYHEW are spending their honeymoon touring in Wales on a Panhard car, lent by the Hon. C. S. Rolls.

DURING the summer, speed trials will be held by the Lincolnshire Automobile Club on Lord Ancaster's estate at Grimesthorpe.

DURING the Belgian military manoeuvres, to be held from the 16th to the 21st inst., some further trials are to be made with motor-cars.

MR. D. M. WEIGEL is driving a 25-h.p. Clement light racing car in the Paris-Vienna race, instead of his Panhard, which he has sold.

THE Hon. Arthur Stanley, M.P., and Captain Lee, M.P., are touring in Ireland on a motor-car. The other evening they arrived at Galway, from whence they intend to go through Connemara, and on to Roscommon.

DR. A. H. COOK, of Rosslyn Hill, Hampstead, was summoned last week for keeping a motor-carriage without a licence authorising him to do so. The Bench being assured that the offence was not intentional, imposed a fine of five shillings and costs.

A REPORT says that at the meeting of the Wakefield Chamber of Agriculture a resolution was passed expressing the opinion that horses drawing vehicles should have the right of the road, and that the speed of the cars should be left in the hands of the local authorities. Why not pass a resolution that only members of the Wakefield Chamber of Agriculture should have the right to walk in Yorkshire?

MESSRS. STANLEY BROTHERS, of Newton, Mass., who, it will be remembered, were the originators of the steam car now known as the Locomobile, have devised a new steam vehicle. The engine

MR. AND MRS. H. V. HOLDEN ON ONE OF THEIR MORS CARS.

THE Buckinghamshire Chamber of Agriculture is urging the County Council to make new regulations with regard to the speed of motor-cars.

UNDER the direction of Mr. C. McAdams, of West Hartlepool, a trial of the consumption of motor-vehicles has just taken place between Manchester and Seaton Carew, and from thence to Morecambe.

MR. E. T. HOLBROW, of the Earlsfield Motor and Engineering Works, Earlsfield, S.W., is now keeping a stock of Pratt's motor-spirit. He is also well equipped to undertake repairs to motor-cars of all kinds.

THE Stockton Chamber of Commerce has adopted a resolution in favour of the strict enforcement of the present regulations with regard to motor-cars, and urging that twelve miles per hour should be the maximum speed.

THE latest addition to the ranks of motorists is Sir William George Pearce, Bart., the well-known shipbuilder and shipowner, who has just instructed the Daimler Motor Company to build two carriages for him. One of these is a standard 12-h.p. car, while the other is what is known as an "Estates" wagonette.

is hung horizontally under the body and transmits its power direct, by a gear, to the rear driving axle, doing away with the chain. All the parts are enclosed in a dust-proof case, which can readily be removed for inspection purposes. The engine itself is a radical departure from the familiar type. The cylinders have no projecting flanges; the slides run on steel balls, which, it is claimed, prevent all wear, lost motion, and loosening of the packing.

MOTORISTS intending to tour in Ireland may expect the natives to be more familiar with the automobile than was the good lady who met a well-known colonel when on his car, and when she arrived in Wexford told everyone she had met "a carriage from the other world with a horribly ugly demon driving it." In order to enjoy the beauties of the country some guide-book is desirable—a fact which has caused Messrs. A. and C. Black to include Ireland in their useful series of guides. Within 150 pages we have here a concise and well-arranged pocket companion which has the merit of accuracy, and is also written with literary skill. The maps of the various districts of the Emerald Isle are excellent.

CORRESPONDENCE.

POSSIBILITIES AT HARROGATE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I point out that Harrogate is a very delightful and well-patronised place for, say, six months during the year? At present there is no other conveyance running on the ground, hence it is a most favourable opportunity to introduce a motor-car. As to whether the undertaking is likely to prove a success, I would recommend any suitable motor-car company that would be disposed to make local inquiries ere long.—Yours faithfully,

S. B.

WANTED—A BUSINESS VEHICLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a fair representative of a very large number of people who want to purchase automobiles just as soon as the makers of the new vehicle will give them such a conveyance as they want, I wish, through the *Journal*, to call the attention of manufacturers to the trade which they are neglecting. I have for more than twenty years been a salesman for a large wholesale grocery firm. In the performance of my duties I am forced to visit from fifty to sixty customers each day. Now I must do this in all kinds of weather, and through and over all kinds of streets and roads. That which would best enable me to do this is a motor-car, but when I seek to get one I find that the makers are turning out only a fair weather conveyance. They expect me to sit in an open car, unsheltered from the elements, to catch pneumonia and rheumatism while I attend to my daily rounds. What I want, and what hundreds of other men want, is a not-too-expensive, strongly-built motor-car, which will go the route, and which can be closed up so as to afford perfect protection for its user from the cold or the heat, to say nothing of rain or snow. Surely this is "a crying need," which is well worth the while of any motor-vehicle builder to especially cater for.—Yours truly,

TRAVELLER.

THE SPEED OF THE SERPOLLET CAR.

THE name of the Hon. C. S. Rolls having been introduced in connection with the Serpollet steam car into an advertisement, we have received communications from the Speedwell Motor and Engineering Company and also from Mr. Rolls, the purpose of which is served by the publication of the following:—

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Speedwell and Gardner-Serpollet Companies have shown considerable alarm in consequence of an advertisement in which my name was unfortunately brought in.

As a matter of fact, the letter which has been advertised over my name was in reply to a request for some particulars of a record, and was never intended to be used as an advertisement or for publication in any form; and, as soon as its publication came to my notice, I immediately wrote to the advertisers with instructions to stop it, and received an apology from them. At the same time I wrote to both the Speedwell and Serpollet Companies explaining the facts, and received their thanks, although it was, they said, too late to stop the letters and advertisements which they had sent for publication.

Steam has a great advantage over petrol for certain purposes, owing to the horse-power it can exert for short periods, but I do not propose to open up a discussion as to the merits of each system. Suffice it to say that the advertisement in question had no authority from me, and that I am not (as has been suggested) interested financially in either the Mors or the Serpollet, although I have ordered cars of both makes.—Yours faithfully,

CHARLES S. ROLLS.

MOTOR-CYCLING RECORDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the account in this week's *Motor-Car Journal* of the records made at the Crystal Palace on motor-bicycles, none of these times can be considered as motor-cycle records, as they do not approach the times made by me on my motor-tricycle at Canning Town on October 31st, 1900, when the times up to five miles read as follows:—One mile, 1 min. 23½ sec.; two miles, 2 min. 49½ sec.; three miles, 4 min. 13½ sec.; four miles, 5 min. 37½ sec.; five miles, 7 min. 1½ sec.—Yours faithfully,

CHARLES JARROTT.

THE Begbie Manufacturing Company inform us that they have taken up the sole English agency for the Leblond batteries. These are of the hermetically-sealed liquid type. They are made up in sets of four elements, each having a capacity of 15 amperes at 1.6 volts for motor-cycles and voiturettes, and 20 amperes at 1.6 volts for cars of from 6 to 20 h.p. It is claimed that they are capable of sparking a motor for a minimum distance of 10,000 kilometres (about 6,200 miles).

FURIOUS DRIVING CASES.

AT Marlborough Street Police court (London), L. Pacana, Pulteney Chambers, Little Pulteney Street, W., was summoned for furiously driving a motor-car on the public highway. Constable Rose, 382 D, said that on the 7th May he saw the defendant driving a motor-car at a rapid pace along Portland Place. When near Weymouth Street it knocked down a man named Ashton, who was crossing the road, and he had to be taken to the Middlesex Hospital. Mr. Drake, in defence, said the car was only travelling at a speed of about seven miles an hour. The horn was blown, and Mr. Harvey Du Cros, the owner of the car, shouted and yelled to Ashton to get out of the way. The car was pulled up immediately, but owing to the road being muddy at the time the driver might not have been able to stop it quite as quickly as usual. Mr. Kennedy said he had come to the conclusion that the driver of the car was going too fast and that he ought to have got out of the way or stopped. He would be fined £5, with 2s. costs.

R. H. Cox, Manor Cottage, Old Windsor, has been fined £2, including costs, by a Windsor magistrate, on a charge of having furiously driven a motor-car.

BEFORE Sheriff Davidson, at Hamilton, J. H. Anderson, Dalsersf, was charged with culpable homicide, or furious and reckless driving, by having, on 2nd May, driven a motor-car down Machans Brae, Larkhall, in a reckless manner. The allegation is that he failed to stop on the approach of a wagonette, the horses yoked to which became unmanageable, and the occupants were thrown out. One of them, John Kemp, labourer, Dalsersf, was so severely injured that he died a few days afterwards. After emitting a declaration, he was liberated on £30 bail.

BARON DE CATERS ON HIS MORS RACER.

La France Automobile.

At the Bradford West Riding Police-court, Walter Booth, Clayton, and Arthur Wilson, Bramley, were summoned for furiously driving their motor-cars. The case for the police was that on May 17th the defendants were proceeding abreast down the Wakefield Road at Drighlington at a rate between twenty and thirty miles per hour. Booth, who was convicted of a similar offence a few weeks ago, was fined £5 and costs or one month's imprisonment, and Wilson £3 and costs or one month.

At the Guildford County Bench, A. Rackman, of London, was summoned for having driven a motor-car at a pace exceeding 12 miles an hour, near Ripley, on the 11th ult. Fined £5.

At the Bowness Petty Sessions, G. Gladwin Errington, of London, was charged with furiously driving a motor-car in Lake Road, Bowness, on the 21st ult. Mr. G. Gatey, jun., appeared for the defendant, who was not present. Police-constable Park said that about seven p.m. on the day named he was on duty near the Royal Hotel, and saw a motor-car come round the Liverpool Bank from the direction of the Kendal Road at a very furious rate. Witness put up his hand and called on the driver to stop. He applied the brake and nearly threw the machine over, opposite to Robinson's shop, a distance of about 45 yards from where he first saw him. Witness called to him again, and defendant went on in the direction of Windermere. Witness telephoned to Sergeant Kerr at Windermere that a motor-car had come through Bowness at a rapid rate. Shortly afterwards the car came down to Cragg Brow and stopped opposite the Post Office. There were three occupants in the car. Witness, in company with Sergeant Kerr, went on the following morning to the Ferry Hotel and identified

defendant and his two friends. Witness charged defendant with driving furiously on the previous night. He replied, "Do you say I was the driver?" Witness replied, "Yes, you were." Police-sergeant Kerr spoke to receiving a telephone message at Windermere from Police-constable Park. He saw the car in Victoria Street, and spoke to the driver, asking him for his card. The driver said he had not got a card. He then asked him for his name and address, and he gave the name of Tuffy Waugh, of Stockhouse, Settle, Yorkshire. On the morning following witness went to the Ferry Hotel, where he saw the driver whom he saw in Windermere and found that his name was Claud White. He told defendant so, and defendant replied, "Yes, that is my name." Witness asked him for his address, and he absolutely refused to give one. Mr. Gatey explained that White and Waugh arranged before White's departure that Waugh would "stand the racket," White having to go away on the following day to Paris. Errington, the man who had been summoned, never drove the car at all. The chairman said the impression that he had in his mind was that the three men arranged to shuffle their names about so as to evade the consequences of their act. After fifteen minutes' retirement, the Chairman, on behalf of the Bench, said that seeing that one of the party had come forward and said that White was the driver, they suggested that the case against Errington should be dismissed, and that a fresh information should be laid against White and that the witness Waugh should appear to prove that White was the offender. If there was any danger of White's not appearing, the police ought to issue a warrant for his apprehension.

CHARLES FROST and Collett Frost, of Plymouth Grove, Manchester, and John Stevenson, of Fallowfield, have been fined 1s. and costs at Stockport County Police Court for driving their automobiles at a greater speed than six miles an hour. The prosecutions were taken under a bye-law of the Cheshire County Council, and after the magistrates had given their decision, the defendants' solicitor asked them to state a case for appeal, as he contended the bye-law was invalid.

At Brentwood, W. Mapp Thompson, of Mitcham, was summoned for driving a motor-car at more than twelve miles an hour. Police-constables Pastfield and Nurse proved that defendant drove from Brentwood to Romford in twenty minutes. Defendant, who wrote that he could not attend, was fined £3, and costs 10s. 6d.

In Dingwall Sheriff Court, Sheriff Hay Shennan, after hearing evidence, has convicted Talbot Clifton, shooting tenant, Rhidroroch, Loch Broom, of driving a motor-car through Strathpeffer above the regulation rate of twelve miles on April 15th. The driver of the Strathpeffer train stated that he tried to gain on the car, but failed. Several witnesses said the accused was going faster than the train. A fine of £5 was imposed.

JOHN GOWAN, Rock Ferry, was summoned at Birkenhead for furiously driving a motor-car at Eastham on the 17th ult. The police evidence was that defendant drove his car at a speed of twenty-five miles an hour, the speed being reckoned by timing its passage over a measured half furlong. Defendant said he would not think of travelling twenty-five miles an hour; it would be suicidal. The magistrates said they would give defendant the benefit of the doubt and dismissed the case.

WILLIAM MACLASE, 31, Mount Street, Liverpool, was summoned at Birkenhead for furiously driving a motor-car, the police evidence being that he was travelling at twenty-eight miles an hour. Defendant emphatically denied the statement, and said the car was being tried for the first time and did not work as well as it might have done. The magistrates found the case proved, and fined defendant 5s. and costs.

THOMAS GEORGE HOXLRY, of Malpas, Cheshire, was charged at the Llandudno Police Court with driving at a furious pace a motor-car along Trinity Square and Clonmel Street, Llandudno, on May 20th. A fine of 5s. and costs was imposed.

At the Altrincham Petty Sessions, Frank Jackson, Peel Causeway, cycle manufacturer, was summoned for the alleged furious driving of a motor-tricycle at Rostherne on May 13th. Constable Scott stated that on the night in question he was in Knutsford Road, Rostherne, on the Knutsford side of the Bollin Bridge, when he saw the defendant furiously driving a motor-tricycle along the road in the direction of Altrincham. He would be travelling at thirty-five miles an hour. Witness put his hands up, called to the defendant to stop, and blew his whistle, but defendant went on and took no notice. Mr. Brown, solicitor for the defence, contended that this was a case of mistaken identity. Jackson never went out on an automobile that day. He called six witnesses, and the evidence, he submitted, went to show that it was quite clear the defendant could not have been on the road at the time. He asked that the county should be made to bear defendant's costs if the Bench believed the police had been mistaken. The Chairman said the justices believed this was a case of mistaken identity. The case would be dismissed, and they considered that the county must pay the advocate's fee and the whole of the expenses of defendant.

At Solihull, B. Gibberd, 46, Regent Street, Leamington, has been summoned for furiously driving a motor-car in the Kenilworth Road, Balsall, on the 19th ult. On Bank Holiday the defendant was seen by Sergeant Boulton and two other officers in charge of a motor-car on the road named. Its speed was timed for half a mile, and the police asserted that that distance was covered in 75 secs. The car was stopped by the police, and the pace, it was stated, worked out at twenty-four miles an hour. A fine of 20s. and costs, amounting in all to £1 17s. 6d., was imposed.

At Tonbridge Petty Sessions, Glanville Kenyon, of Bromley, Kent, was summoned for driving a motor-car at a rate exceeding twelve miles an hour at Hildenborough on May 17th last. Police-constable Wood spoke to seeing the motor-car at Hildenborough going in the direction of London.

He timed it for a distance of 325 yards, which was covered in 35 secs. Defendant said he knew the law, and he was not going at more than eleven miles an hour. The Bench imposed a fine of £1, and the costs, 13s.

JOHN WATTS, driver to the Earl of Warwick, has been fined £2 2s. including costs, for driving his car to the common danger in Warwick.

At the Highgate Petty Sessions on Wednesday, the 28th ult., Mr. T. G. Payne was summoned for driving down Muswell Hill Lane to the danger of life or limb. The mounted policemen swore that Mr. Payne was driving down the hill at a speed of twenty miles an hour. On cross-examination by Mr. Staplee Firth, the magistrates dismissed the case.

Two motorists—B. S. Ledger, of Staincross, near Barnsley, and E. L. Cooke, of York—have been fined for driving motor-cars on the highway at a greater speed than twelve miles an hour. A measured quarter-mile on the Dringhouses Road was the cause of their undoing.

W. B. AVERY, Birmingham, has been fined £5 and £1 18s. costs for driving a motor-car at an excessive speed near Ryde, Isle of Wight.

THE Hon. A. H. Baring, of Northington, pleaded guilty, at Basingstoke, to driving a motor-car at a greater speed than twelve miles an hour, viz., twenty miles an hour, at Preston Candover, on May 3rd. Police-constable Phillips said that at 6.35 p.m. on the date in question he was standing in his garden, when he saw a motor-car coming from the direction of Axford. He timed it from opposite the letter-box to his gate, which was just half a mile, and found it covered the distance in ninety seconds. The Chairman of the Bench said defendant had evidently broken the law, and must pay a fine of 40s., with 7s. costs.

At Bristol, Herbert Sharpe was summoned for furiously driving a motor-bicycle between Horfield and Filton on May 11th. Accused, who pleaded that he was not running beyond the speed allowed by the Act, was fined 20s. and costs, or fourteen days. In stating the decision of the Court, Captain Belfield said:—"You gentlemen who ride motor-bicycles think you can fly about the country as you please. In this instance the offence is aggravated by your withholding your name and address."

At the Dover County Sessions, last week, Cecil G. Cathey, of Ripple, was summoned for driving a motor-tricycle on April 17th at a speed greater than twelve miles an hour—the legal limit. The Bench inflicted a fine of £5 and 11s. 6d. costs.

At the Stroud Police Court, Thomas Guildford, of London Road, Stroud, was summoned for furiously riding a motor-cycle, to the danger of the public, on April 28th. Defendant was fined £1 and 10s. costs.

ROBERT CHARLES KNIGHTS, cycle agent, Chelmsford, has been fined £2 and 10s. costs for driving a motor-car at a greater speed than twelve miles an hour, at Newport, on May 14th.

A MOTOR-BATTERY INJUNCTION.

IN the Chancery Division, the plaintiffs in the action, De Dion-Bouton and Co. v. Brown Bros., have applied for an interim injunction to restrain the defendants from selling as De Dion-Bouton batteries for motors any not of the plaintiffs' manufacture. Mr. Hughes, K.C., for the plaintiffs, said affidavits filed by the representatives of Mann, Egerton, and Co., and the Sports Trading Co., of Coventry, showed that they applied to defendants in February and March for "one De Dion battery" and they received batteries which were not those made by the plaintiffs.

Mr. Younger read an affidavit filed by Mr. Brown, in which he said he had given strict injunctions to those in charge of their motor department that no parts not manufactured by the plaintiffs were to be sold by the name De Dion alone. Two batteries had been inadvertently sold under the name De Dion. It was open to anyone to manufacture and use parts and accessories of the De Dion type, and the defendants had sold and claimed to be entitled to sell parts not of the plaintiffs' manufacture under the name De Dion if they used in addition the words "pattern" or "imitation."

Mr. Justice Joyce thought the plaintiffs might be entitled to an injunction to restrain defendants from selling as and for the goods of the plaintiffs batteries or other goods not manufactured by the plaintiffs.

Mr. Hughes said he would be satisfied with such an order.

Mr. Younger was willing to give an undertaking in the terms of his lordship's suggestions, and the motion was ordered to stand till the trial, the costs to be costs in the action.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JUNE 14, 1902.

[No. 171.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THERE have been some interesting times in the Uckfield Petty Sessions Court recently, and more are promised when some adjourned cases against motorists come on for hearing. At St. Neots, too, a whole batch of motorists have been hauled before the Court, and fined with a uniformity that does credit to the fixed ideas of the magistrates there. Elsewhere in the present issue we publish a list of convictions against automobilists for furious driving, from which it will be seen that the police are unusually on the alert, and not only in Surrey and Huntingdonshire, but throughout the country generally, they seem to have made up their minds to catch as many motorists as they conveniently can. Whilst this long list of convictions, with only two or three dismissals to vary the monotony of the reading, is a tribute to the energy and misplaced enthusiasm of the police, it also reveals a celerity of movement on the part of motor-cars, which their drivers might wisely moderate in view of the renewed efforts of the County Councils and Chambers of Agriculture to thwart the progress of the automobile.

The Stoning of Motorists.

THE stoning of motorists by small children is becoming too familiar to be pleasant both in England and the United States. We are glad to see that Colonel Crompton is raising the question, so far as Kent and Surrey are concerned, and would suggest to provincial automobile clubs that they might usefully communicate with the police in their respective districts when such incidents are reported on their tours. In the United States the school children have become even more aggressive than at home, and, tired of being constantly hooted at and made the target of repeated bombardments of decaying vegetable matter, stones and other projectiles, American automobilists have made an appeal to the Board of Education to compel the school children to cease annoying them. This is believed to be the most effective way of reaching the mischievous boys, for the abuse of automobilists is declared to be so general that the arrest in a few isolated cases of the miscreants would not effect the reform desired or mitigate the nuisance.

The 100 Miles Trial.

IN the quarterly 100 miles trial of the Automobile Club only two cars took part, viz., a 8-h.p. Rochet-Schneider car and an Oldsmobile. The average cost of fuel per mile of the former was .77d. and of the latter .51d. Both vehicles attained speeds up to the legal limit. The Rochet-Schneider car was stopped accidentally on the return journey, but was restarted without any adjustment after a stoppage of half a minute. It travelled the one mile test, which includes Dashwood Hill, in 6 mins. 52 secs. The 4-h.p. Oldsmobile stopped five times, chiefly owing to minor matters. The fourth stop was occasioned by taking up water.

Then the driving clutch, which had previously been slipping, was tightened, with the result that the running of the car was greatly improved. The one mile, including Dashwood Hill, was traversed in 9 mins.

Automobiles and the Yeomanry.

A VISIT was paid by Mr. J. R. Marten, of Brighton, to the Sussex Yeomanry Camp at Horndean, near Lewes, on a 6½-h.p. car. He had three passengers, and on going down the north side of Falner Hill a picket signalled a stoppage. The picket then tried to coax his unwilling steed to pass the motor-car, but, ten minutes having been spent in a fruitless effort, the rider had to dismount and lead the animal while the motor-car passed by. Apparently, the education of the Yeomanry horses has been sadly neglected, for when Mr. Marten got within a hundred yards of the nearest horse in the camp the commanding officer sent word that motor-cars were not allowed within hearing distance, as they might cause a stampede among the horses. If the presence of a motor-car is to disorganise a yeomanry camp, the value of the automobile in warfare is increased wonderfully; and the enemy with the largest number of powerful motor-cars could easily cause consternation in the ranks of its opponents.

Military Automobiles.

AT length the Army authorities seem to have awakened to the utility of motor-vehicles for transport service for the Army. At the present time a number of drivers are being trained at Woolwich, which, we understand, may become the centre of the military automobile department of the country, and it is even suggested that the carriage department of the Arsenal there may become one source of supply. The waggons on which the drivers are now being practised are on the Thornycroft system, and they have been seen in various parts of the Metropolis during the last few weeks. The other day one of these military transport waggons was seen fully loaded with about sixteen soldiers in khaki, and attracted considerable attention as it careered through the streets of a quiet suburban neighbourhood, most of the spectators imagining it had something to do with the Coronation festivities.

Motor-Car Imports and Exports.

THE returns just issued relating to the British imports and exports of motor-cars and cycles during May last show a small falling-off in the imports and a slight gain in the exports. To deal first with the imports, no less than 394 cars and cycles were imported into this country last month, the value of the same being returned at £93,537. The value of the "parts thereof" is given as £10,838, so that we get a combined total of £104,375, as compared with £121,180 in April last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised twenty-one vehicles amounting in value to £6,351, and £459 of parts, bringing down the net imports in May to £97,565. During the first five months of the

urrent year imports of foreign automobiles and parts in Great Britain have reached a net total of £371,260, representing over 1,400 cars and cycles. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to thirty-two vehicles of a value of £14,296. Of parts the exports attained a value of £288, making a combined total for May of £14,584, as compared with £12,102 in April last. It is satisfactory to find that, so far as the year has gone, that is to say, during the five months ending with May, 123 British-built motor-cars and cycles have been exported, their value being roundly £44,000.

Removing.
